COVENT GARDEN, Oct. 26.—There has been little variation in the prices of most articles during the past week; the market has been well supplied, but trade continues dull. Pine apples are rather on the rise; among them there are many handsome fruit. Grapes are also slightly advanced in price. Melons are becoming very scarce. The supply of Pears and Apples is quite sufficient for the demand; of the former the best sorts at present in the market are—Louise Bonne (of Jersey), Marie Louise, Beurré Diel, and Gansel's Bergamot; among Apples we noticed some fine specimens of Blenheim Orange. Walnuts, Filberts, and Nuts, are tolerably plentiful, and are good in quality: Cob-nuts are selling at from 90*s*. to 100*s*. per 100 lbs. A few Plums are yet to be met with, but they are becoming scarce. Oranges of every kind are now nearly, if not quite over, and Cucumbers are also getting scarce. Among vegetables the supply of Cauliflowers is decreasing; but Brussels sprouts, Savoys, and other winter greens are becoming more plentiful. French Beans are nearly over. Onions are good, and fetch nearly the same prices as last week. Some fine specimens of Celery, clean and well blanched, are in the market. Turnips and Carrots are excellent in quality, and are quite sufficient for the demand. Endive and Lettuces are well supplied. Salsafy and Scorzonera are selling at nearly the same prices as mentioned in our last Report. Radishes bring, also, nearly the same prices as last week. Cut Flowers chiefly consist of Rondeletia speciosa, Combretum purpureum, Pentas carnea, Cactus Jenkinsonii, Gloxinias, Heaths, Chrysanthemums, Lupines, Scarlet Pelargoniums, Mignonette, Fuchsias, Camellias, and Roses.

FRUITS.

Pine Apple, per lb.,	3*s*	to 7*s* 6*d*	
Grapes, Hothouse, p. lb.,	1*s* 6*d*	to 5*s*	
— Spanish, per lb.,	1*s*	to 1*s* 6*d*

James Perrin, Wool Broker.

MARK-LANE, Monday, Oct. 21.

The supply of Wheat from the adjoining counties was small this morning, which enabled Factors to realise the same prices as last week. The demand for Foreign continues limited, and its value unaltered.—Malting Barley finds ready buyers at an advance of 1*s* per qr. above the quotations of this day se'nnight; Grinding remains without alteration.—Beans sell freely, and are 1*s*. to 2*s*. higher.—Peas are also 1*s*. dearer.—In Oats there has been a good business doing, at fully 6*d*. per qr. over the rates of last week.

British, per Imperial Quarter.	*s.*	*s.*		*s.*	*s.*

Friday, Oct. 25.

We are without any fresh arrivals of Wheat for this morning's market, and its value consequently remains unaltered. In Foreign, business is limited, but Monday's prices are fully maintained.—Fine Barley fully supported our quotations, but grinding qualities sell slowly; there is a good arrival from abroad, a large proportion of which continues to come out of condition.—Beans and Peas are scarce, and inquired after.—We have a good supply of Oats, including several cargoes from abroad; holders are firm at Monday's prices, but the extent of business doing is small.

LAVENDER-HILL NURSERY, WANDSWORTH-ROAD.—IMPORTANT LEASEHOLD PROPERTY to be Disposed of, by order of the Executors of the late Mr. W. PAMPLIN, Nurseryman. These valuable Premises with extensive frontage, most beautifully and eligibly situated, and capable of much improvement, consist of the substantial DWELLING-HOUSE, in capital repair,—dining, drawing, and large sitting-rooms, five good bed-rooms, and large underground and other domestic offices; Stable, Lofts, Sheds, and other buildings; about NINE ACRES of LAND, occupied as Nursery Ground. The whole (well adapted for a moderate family, for a Nursery and Seedsman, or for scientific and experimental Agricultural purposes) will be sold by public Auction during the month of November, unless previously disposed of by private Contract.

For particulars apply to Mr. W. J. LOAT, Clapham Common, or to Mr. W. PAMPLIN, Bookseller, 45, Frith-street, Soho.

TO FARMERS.

TO BE LET on LEASE, and entered upon immediately, Two good Corn Tithe-free FARMS, containing about 200 acres—14 acres being productive Hop Plantation, 61 acres Meadow, and the remainder Arable; a convenient Farm-house stands on the Estate, as also an Oast-house and other Farm buildings. The Farm is situated near a Terminus, and the journey to London is accomplished by Railway in 1 hour and 47 minutes; it is also near a good market-town.—For further particulars apply to Mr. ARTHUR SMITH, 6, John-street, Bedford-row.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D and E BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL; And by their Agents, COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL. 47, Lime-street, Oct. 26, 1844.

WIRE-WORK, HOT-WATER APPARATUS, GREEN HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower Stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently-published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street.

WHEAT-SOWING.

GUANO; Genuine Peruvian, Bolivian, and Ichaboe, on Sale; also Potter's Guano, Gypsum, Sulphuric Acid, Sulphates of Iron and Copper, and all other manures. Synopsis of prices, and mode of use, on application, &c.—Apply to MARK FOTHERGILL, 40, Upper Thames-street.

GUANO, IMPORTED BY WILSON AND VAUSE, HULL,

Who have now on Sale a selected Cargo of superior quality, per "Britannia," direct from Ichaboe, with a succession of Cargoes to arrive. Samples, with instructions for use may be had at 17, Bowl Alley Lane.

MR. LAWES' MANURES.—Mixture for Wheat, 7*l.* per ton; Super-phosphate of Lime, 7*l.* per ton. To be had at the Factory, Deptford Creek, near London.

Super-phosphate of Lime, in a concentrated form, may also be procured at Messrs. WARNER'S, 28, Cornhill, in 7 lb. packets, price 1*s.*

WHEAT-SOWING.

FREDERICK BRAIN begs to call the attention of the Agricultural world to his GUANO MANURE, prepared expressly for Wheat crops: it abounds in all the ingredients that are necessary for a good grain crop. He particularly solicits persons who found the Foreign Guano a failure last season to give his a trial, it being much more powerful, and free from adulteration, so justly complained of in the Foreign by Agriculturists, as well as by all the leading Agricultural Journals.

Testimonial to Brain's Guano Manure.—"5 A, Hawley Road, Kentish Town, London, Aug. 15, 1844.—This is to certify that we have subjected Brain's Guano to a most patient and rigorous analysis, and find it contains all the necessary constituents of a good manure, and is well calculated to give fertility to a soil which is either naturally barren, or has been exhausted by over-cropping, by supplying the land with those substances which are absolutely requisite to a healthy vegetation: (it is not adulterated, and can always be depended on, being of uniform composition.)—(Signed) JOHN MITCHELL and FREDERICK FIELD, Analytical Chemists, late of the Royal Polytechnic Institution, London."

Also, BRAIN'S highly-concentrated LIQUID GUANO, for Grass Lands, Gardens, Shrubberies, Hothouses, and Conservatories, price 1*s.* 9*d.* per quart bottle, with full directions for use, (enough for 80 gallons of Liquid Manure), to be had of most respectable Florists, Seedsmen, and Chemists in town and country.

Works, Thomas-st., Duke-st., Stamford-st., Blackfriars-road.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5 A, Hawley-road, Kentish Town.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE Attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill-row, London.

AGRICULTURAL DRAINING. — THE DERBY LEVEL.—The attention of persons Draining their land is directed to this efficient but simple Instrument, presumed to be all that can be required for the purpose, and its price such as to place it within the reach of all. To be had of the Maker, J. DAVIS, Optician, Derby.

TANNER'S VITREOUS CLOTH, a SUBSTITUTE for GLASS for HORTICULTURAL PURPOSES.—The above recommends itself to the notice of Florists and Horticulturists, as producing effects superior to Glass, at a less expense. The support the Proprietor has received from very many highly respectable Florists encourages him to consider that his labours have not been misapplied in bringing before the public an article so generally required. Price of cloth, 7-8ths of a yard wide, thin, 2*s.* 6*d.* per yard.: stout, 2*s.* 1 yard wide, 3*s.* 6*d.* Price of Fluid (for renewing the cloth after lengthened service, 4*s.* 6*d.* and 2*s.* 6*d.* per bottle. Manufactured only by N. W. TANNER, Chemist, Exeter: and Sold by Messrs. Butler and Muckley, Covent-garden, London; Mr. Cunningham, Paradise-street, Liverpool; Messrs. Lucombe and Pince, Exeter Nursery.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, &c.

McKIBBIN'S PATENT ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, to a great extent, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5*d.* each (being less than 9*s.* 6*d.* per square of 100 feet), with printed directions for applying them, same as adopted at the Government Dock-yards and various other public buildings.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 16, East India Chambers, Leadenhall-street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewatts: Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square; Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

*** The "IMPROVED ROOFING FELT" will be found much more durable than the Common Felt made in lengths, and not subject, like it or continuous sheets of other material, to be stripped by storm; *it does not require to be either painted or coated*, can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June 6*, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS'S Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers, for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup; giving a zest far superior to the long-established favourites; more wholesome and of less cost —*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

HEALTH, LONG LIFE, AND HAPPINESS.—EXTRAORDINARY CURE OF SCORBUTIC HUMOUR.

I, WILLIAM WOOD, of Rockwell Green, in the parish of Wellington, Somerset, hereby certify, that for about *seven years* I was afflicted with SCORBUTIC HUMOUR on my nose, with a continued discharge, rendering me almost unfit for society; I tried several medical men, and various medicines for curing the same, but all proved of no avail, producing no beneficial effect; at last I was persuaded to try PARR'S PILLS, and after taking two small boxes and part of a third, I was completely cured, and I now feel no pain or inconvenience as before. Many parties in the neighbourhood, and your Agent for Wellington, Mr. GREEDY, can bear witness that my testimony is correct, and I wish it to be made known, that others similarly afflicted may be encouraged to try the same medicine, which under the blessing of God has proved so serviceable to me.

Witness my hand this 5th day of August, 1844. WM. WOOD.

In the presence of JOHN GREEDY, Wellington.

From Dr. C. STEANE, 184, Fulton-street, sole agent for Brooklyn.—An instance of the singular efficacy of PARR'S LIFE PILLS, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion: her bowels were sometimes constipated, and at others lax, and never regular. At this period, she was recommended to try PARR'S LIFE PILLS, when no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.

To T. Roberts and Co., April, 1844. Yours truly, C. STEANE.

These, and hundreds of other cases of DECIDED CURES, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine-vender's. The cures, in many instances, were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS, in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of Spurious Imitations of the above medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE Letters on a RED GROUND, engraved in the Government Stamp pasted round each box. Sold by all respectable Medicine Venders.

SUBSCRIPTIONS

FOR THE

NATIONAL TESTIMONIAL

TO

Mr. ROWLAND HILL,

Author of the Penny Postage,

WILL CLOSE on the 30th NOVEMBER Next.

Of all the sources of income stated in the recently published Quarterly Returns of the Public Revenue, none exhibit *so large* a proportionate increase as the *Post Office*. On the year's net revenue, the Customs have increased at the rate of about 10 per cent., the Excise 1½ per cent., the Property Tax 2 per cent., while the *Post Office revenue*, under its almost nominal rate of a penny, has increased above 13½ per cent., and the increase on the quarter has been even as much as 25 per cent.

These cheering results show that (though the *plan of Penny Postage* is yet but *imperfectly tried*) the *complete restoration* of the Post Office Revenue to its amount before the Penny Postage was adopted is not an event far distant, if it be fully and honestly carried out; and the *City of London Mercantile Committee on Postage* desire to impress these satisfactory results most emphatically upon the Public, in announcing the *approaching close* of the National Testimonial to Mr. Rowland Hill. *All* parties are unanimous upon the great *moral* and *commercial* advantages of the *Penny Postage*. Its expediency as a *financial* step has been the *sole* ground of question; but now, even this *can scarcely be doubted*: for let it be remembered, that the Old Postage Revenue had been absolutely *stationary* for twenty years,—retrogressive, in fact, if we consider the increase of population, education, and commerce during the period. The change which Penny Postage has effected, is to make the *Post Office Revenue* the *most buoyant* source of National Income, bidding fair to become more profitable than it has ever been. The Committee, therefore, call upon the Public to reward, with suitable gratitude, the author of this great and triumphant measure.

The Committee have the satisfaction to announce that the subscriptions, headed by the chiefs of political parties and of commercial wealth, already reach 10,000*l.*; but 10,000*l.* cannot be held to be a sufficient *national* reward for such *national* services. The Committee, therefore, urge upon the *nation at least to double* this sum. If every letter-writer, for only a single week, would pay a twopenny instead of a penny rate for his letters, the amount, and more, would be raised. In proportion as the public show their gratitude to Mr. Hill, so they strengthen the chances for the complete adoption of his plan, *now but partially carried out*. Its perfection will bring greatly-increased convenience to themselves, and increased advantage to the Post Office Revenue.

Never have the services of any *Public Benefactor* been *requited* as Mr. Hill's have been. Quitting a *permanent* situation for a *temporary* public engagement to carry out his plan, Mr. Hill's services, whilst his plan was yet not carried out, were dispensed with, and he received the following acknowledgments of his merits, and—*nothing more*:—

"I gladly avail myself," writes the present Chancellor of the Exchequer, "of the opportunity of expressing my sense of the satisfactory manner in which, during my tenure of office, you have discharged the several duties which have been from time to time committed to you." "I entertain," writes Sir Robert Peel, (who has also subscribed 10*l.* to the Testimonial) "a due sense of the motives by which your conduct, in respect to Post Office arrangements, has been actuated, and of the zeal and fidelity with which you have discharged the duties committed to you."—Mr. Trevelyan, on behalf of the Lords of the Treasury, writes thus:—"I am also commanded by their Lordships to take this opportunity of stating, that they consider it due to you, on the termination of your engagement with the Government, to express to you the approbation with which they have regarded your zealous exertions in the execution of the duties which have been intrusted to you; and how materially the efficiency of the Post Office arrangements has been promoted by the care and intelligence evinced by you in the consideration of the various important questions which have been referred to you."

Under these circumstances the Committee call upon the *Public* to come forward with due generosity, and reward Mr. Hill themselves, as the *unrequited Inventor* of the *great measure of Penny Postage*—a measure which has opened the blessings of free correspondence to the Teacher of Religion, the Man of Science and Literature, the Merchant and Trader, and the *whole British Family*, especially the *poorest* and most *defenceless* portion of it;—a measure which is the *greatest boon* conferred in modern times on *all the social interests* of the *civilised world*; for Penny Postage is spreading its influence throughout Europe and reaching even Russia. The Committee rely on the gratitude of their countrymen, and feel sure that this, their last appeal, will not be made in vain.

(Signed) GEO. LARPENT, Chairman.

Subscription Cards, and every information, &c., may be obtained on application to the Secretary, Mr. GEORGE WANSEY, Solicitor, 3, Moorgate Street, London.

Price Sixpence, free by post.

Age	20	25	30	35	40	45
Ann. Pr.	1l 17 10	2l 5 8	2l 16 6	3l 11 3	4l 14 0	6l 13 1

Persons assured to the amount of £500 participate in the profits of the Company.—Subscribed Capital £200,000.

For Forms of Proposal, and other particulars, apply at the Offices, 126, Bishopsgate Street, corner of Cornhill, City.

FARMERS' AND GRAZIERS' MUTUAL CATTLE INSURANCE ASSOCIATION. Offices—366, Strand, London.

The especial object of this Association is to give to Farmers, Graziers, and Owners of Cattle, the best means of protecting themselves against losses by those diseases and accidents which they can neither foresee nor control, but which have hitherto been most injurious, and often ruinous to thousands.

PREMIUMS.

Neat Cattle and Cows, against death by all diseases and accidents save *pleuro pneumonia* (usually called the "Epidemic," 30*s.* per 100*l.* value.

Including *pleuro pneumonia*, 20*s.* per cent. additional; being at the rate of 50*s.* per 100*l.* value.

Pleuro pneumonia will not be taken alone at this latter rate.

Prospectuses and every information may be obtained at the Office, (if by letters, post-paid), addressed to WILLIAM SHAW, Esq., 366, Strand, London; or the Agents in the Country.

N.B. References can be given to several persons in Dorsetshire, Cheshire, Lancashire, Nottinghamshire, Yorkshire, &c. who have experienced losses, and have been promptly paid.

HENRY FLOWER, Secretary.

BRITISH MUTUAL LIFE ASSURANCE SOCIETY, 17, NEW BRIDGE STREET, BLACKFRIARS.

Directors.

John Atkinson, Esq., Well-st., Hackney.
Joshua Burgess, Esq., Park-st., Grosvenor-square.
George Godwin, Esq., F.R.S., F.S.A., Pelham Crescent, Brompton.
Captain C. Twisleton Graves, Army and Navy Club.
Nutter Gray, Esq., Hackney.
Thomas Hamber, Esq., Barnsbury Park.
John Lodge, Esq., Portman-st., Portman Square.
Robt. Remmett, Esq., Temple.
John Richards, Jun., Esq., F.S.A., Mayor of Reading.
George Alfred Walker, Esq., St. James's Place.

Consulting Actuary—W. Ratray, Esq., King William-st., City.

The greatest present benefit, and the greatest future advantages to those who attain the average duration of Life are secured to the Assured in this Office, *a combination of advantages presented by no other in London.*

The principle adopted in the distribution of the profits is *peculiar to this Office*, and is at once safe, equitable, and favourable to young and good lives. The surplus is reserved for Members who survive the period at which their premiums, with accumulated interest at 5 per cent., shall amount to the sums assured, and may be received in cash, or applied in the reduction of the future premiums, or to the increase of the sum assured.

The Premiums are deduced from the Government experience, and are accurately adjusted to the several ages. At early and middle life they are about *one-fourth lower than at most other offices.*

All the objects of Life Assurance may be effectually accomplished at this Office.

Every facility and information afforded on application at the Office, 17, New Bridge-street, Blackfriars.

Charles James Thicke, Resident Secretary.

METROPOLITAN LOAN COMPANY, ESTABLISHED 1839.

Offices, No. 1, Craven Street, Strand, London.—Open from Eleven till Three o'clock daily.

Loans are advanced by the Company on the security of two responsible housekeepers, in sums of 10*l.* 10*s*, 15*l.*, 20*l.*, 25*l.*, 30*l.*, 35*l.*, 40*l.*, 45*l.*, and 50*l*, for periods of twenty-five weeks, at 2½ per cent., or of fifty weeks at 5 per cent., at the option of the borrowers, to be repaid by weekly instalments. If the securities are approved by the directors at their weekly meeting, the loans are immediately advanced. Amounts exceeding 50*l.* are advanced by special agreement with the directors. Forms of application, containing the rules and regulations, may be had at any hour of the day, price 2*d.*

RAY SOCIETY, instituted 2d February, 1844.—This Society has been formed upon the principle of the Parker, Camden, Sydenham, and other Societies, for the purpose of securing to those attached to the study of Natural History, such Works on the various branches of Zoology and Botany as could not be obtained by other means; and will consist of original works; of new editions of works of established merit; of rare tracts and MSS.; and of translations and reprints of foreign works. Every subscriber of One Guinea annually will be considered a member of the Society, and will be entitled to a copy of every work published by the Society. The Council have great pleasure in stating that the number of Members already exceeds 300, and beg to call the attention of their friends to the necessity of sending in their names as early as possible, in order that they may be enabled to determine the number of copies of their works which they ought to print. The Council hope to publish two volumes before Christmas, the first of which will consist of translations from the German and Italian, of Reports on the progress of Zoology and Botany during the last few years.

Communications on the business of the Society are requested to be addressed to the Secretaries, Dr. George Johnston, Berwick-upon-Tweed, and Dr. Lankester, Golden-square, London. Subscriptions to be sent, by post-office order or check, to the Treasurer, J. S. Bowerbank, Esq., 45, Park-street, Islington.

George Johnstone, M.D. } Secretaries.
Edwin Lankester, M.D. }

SILVER PLATED DISH COVERS.—A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, opposite the Bank of England, submit for choice in their Plate-rooms many patterns of SILVER PLATED DISH COVERS, of Sheffield Manufacture, from 15 to 20 guineas the set, viz.:—

Double Dome Pattern.

	Size.	£	s.	d.
1 Pltd. Dish-cover,	20 in.	5	13	6
1 ,, Dish-cover,	18 in.	4	7	6
2 ,, Dish-covers,	14 in.	5	12	0
Per set .		£15	13	0

The Melon Pattern.

	Size.	£	s.	d.
1 Pltd. Dish-cover,	20 in.	5	17	6
1 ,, Dish-cover,	16 in.	4	14	0
2 ,, Dish-covers,	14 in.	6	6	0
Per set .		£16	17	6

The above have silver handles and mountings, and silver shields for engraving the crest or coat of arms. A price current, illustrated by drawings, and containing every information relative to the purchase of silver or Sheffield plate, may be had on application, or will be sent into the country, free of postage, in answer to a paid letter.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, Architects, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. Weeks and Day have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

NETTING for SHEEP FOLDS, made of Cocoa-nut Fibre, a material known to possess the most extraordinary durability when exposed to alternations of weather. A prize was awarded for this Netting at the meeting of the Royal Agricultural Society at Bristol, in 1842; and it is strongly recommended to the notice of Agriculturists in the Society's Report for that year. It will wear out several sets of tarred Hemp Netting, and is so light that a herdsman can with ease carry 200 yards of it.—Sold in nets of 50 and 100 yards long, 42 inches high, by the Manufacturers, WILDEY and CO., 7, HOLLAND-STREET, Blackfriars-road, London.

THE HAIR.—Of the numerous compounds constantly announced for promoting the growth, or reproduction of the Hair, few survive, even in name, beyond a very limited period, whilst

ROWLAND'S MACASSAR OIL,

with a reputation unparalleled, is still on the increase in public estimation. The singular virtues of this successful invention for Restoring, Preserving, and Beautifying the Human Hair, are too well known and appreciated to need comment. The very facts of the high and distinguished patronage it enjoys, its general use in all countries, together with numerous testimonials constantly received in its favour, are authorities which stamp its superior excellence and title over all attempts of a similar nature. Being universally preferred, its consequent great demand excites the cupidity of unprincipled shopkeepers, who vend the most spurious trash as the "genuine" Macassar Oil: whereas, the genuine article is wholly the invention and property of A. Rowland and Son, and the amalgamation of its costly exotic materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "Macassar Oil." The genuine article has the words

ROWLAND'S MACASSAR OIL,

engraved in two lines on the wrapper; and on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per Bottle. Sold by the Proprietors at 20, Hatton Garden, and by Chemists and Perfumers.

*** All other Articles sold under the same name are FRAUDULENT COUNTERFEITS.

IMPORTANT to the FASHIONABLE WORLD.—By far the most influential of all the graces that contribute to personal adornment is the Hair. Its recovery, preservation, and improvement proportionally concern the élégantes of our fashionable circles, and any information which will insure these desirable results will be hailed as an inestimable boon. The following extract from the letter of a respectable chemist in Bridlington will be read with the highest interest:—

"A lady, a customer of mine, has found great benefit from the use of your Balm. About six months ago her hair nearly all fell off. I recommended her to try your Balm of Columbia, which she did. In the course of a few applications the hair ceased to fall off. Before she had used one 3*s.* 6*d.* bottle it began to grow very profusely, and she has now a very beautiful head of hair. "I am, gentlemen, yours respectfully,

"Wm. SMITH,

"Chemist and Druggist, Market-place, Bridlington.

"To Messrs. C. and A. Oldridge.—March 13, 1844."

C. and A. OLDRIDGE'S BALM of COLUMBIA causes the Hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again; it also prevents grayness. 3*s* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.

OLDRIDGE'S BALM, 1, Wellington-street, the second house from the Strand.

News of the Week.

The return of King Louis-Philippe to his own dominions has not yet lessened the discussions of the French journals on the policy of his visit, but their speculations offer little novelty and are becoming tedious from frequent repetition. The Ministerial papers still contend that the visit is an event of great national importance; while the organs of the Opposition endeavour to separate the King from the people by asserting that the cordiality of His Majesty's reception was not a demonstration of friendship towards France, but a personal compliment to himself. It is however considered by the more moderate parties in Paris that the visit will lead to favourable results; and that, although the next Session of the Chambers will be a stormy one, the Government has derived fresh strength from the late events, and will be enabled to carry many measures which they could not otherwise have proposed. The marriage of the Duc d'Aumale to the Princess Caroline of Salerno will take place immediately, and will be made the occasion for a general amnesty for political offenders in France and Naples.—From Spain we learn that the two Chambers were constituted on the 17th, and that on the 18th the Ministry brought forward their long-expected bill, for the proposed reform of the constitution. The object of this measure is the curtailment of popular rights, by rendering the Sovereign independent of the Cortes, and by giving powers to the Cabinet which have never yet been sanctioned by the constitution. These important changes are said to be but a small portion of the innovations contemplated by the Cabinet; and if the Cortes should assent to them, the Government will be able to execute by royal ordinances the most vital functions of the state, and to dispense at pleasure with the deliberations of the legislature. The marriage of Queen Christina with M. Munoz, now Duke of Rianzares, to whom she has been privately allied for several years, was officially solemnised on the 13th, in the presence of all the Ministers. This event is likely to give rise to some difficult questions connected with the future title of the Queen Mother, and with the settlement of the pension which she has hitherto enjoyed as the unmarried widow of the King of Spain. A conspiracy set on foot by the Progresista party, has been detected among the refugees resident within the French frontier, and two Generals of that party have been arrested by the French authorities just as they were about to enter Spain.—From Portugal we have accounts of the proceedings in both Chambers, but they possess little interest for the English reader. The Committee appointed to investigate the legislative decrees issued by the Government during the Almeida revolt, have reported doubtfully on the legality of those measures, but have recommended a bill of indemnity in order to avoid greater evils.—The Belgian Chambers were opened on Tuesday with a speech from the throne. A treaty of commerce has been concluded between that country and the Zollverein, and a very serious increase has been made by the Belgian Government in the duties on silk and cottons, which cannot fail to be most injurious to English interests.—The accounts from the United States come down to the 4th inst., and are remarkable as containing important declarations from Mr. Clay and Mr. Webster against the annexation of Texas. The latter of these statesmen repudiated the idea that England would desire any special connection with Texas, and warmly defended the fixed determination of the British Government to discourage slavery.

Mr. O'Connell's surrender of Simple Repeal for the new scheme of Federalism has not been received as favourably as he expected by the Repeal party. Mr. Duffy, one of his fellow-traversers, has published a long letter protesting against this change of principles, and the leading Repeal organs have announced their opposition to Mr. O'Connell's views. It is believed however in Dublin that an important movement is at hand, and that its first step will be an attempt to unite the Whig party in Ireland with the supporters of Federalism.

Home News.

Her Majesty's Visit to the Isle of Wight.—On Friday Her Majesty and Prince Albert again embarked on board the royal yacht for a few hours' cruise. The weather was exceedingly fine, being more like a summer day than one at this advanced period of autumn. Just as the royal yacht was getting under weigh the Black Eagle, with the Admiralty flag flying at her mast-head, and having on board the Lords of the Admiralty, entered the roadstead from Portsmouth. She immediately put about and accompanied Her Majesty's yacht to the place of embarkation. Here the Lords of the Admiralty disembarked to pay their respects to Her Majesty, and accompanied her on board the royal yacht, where the Admiralty flag was hoisted at the fore, and the royal standard at the main. The yacht then pursued her course to the westward, towards the Needles, followed by the Black Eagle, the Comet, and the Dwarf. After steaming a few miles to the westward, Her Majesty returned to Osborne House, and walked home through the woods. On Saturday morning Her Majesty and the Prince having determined to prolong their stay until Monday, extended their usual early walk (for the first time during the present visit) beyond the precincts of the royal domain, and not being recognised or gazed at, they strolled arm in arm through a portion of Mr. Brooke's grounds, where the sides of the roads are lined with flowers without any protection whatever, such being the respect paid to property so situated, that to touch a single flower would be treated by all classes of the inhabitants as a public delinquency. In the afternoon, Her Majesty and Prince Albert again enjoyed a short cruise towards the east part of the island. About 2 o'clock Her Majesty's steamer Dwarf got under weigh and proceeded from her anchorage in the roadstead to Mead's-hole, having the royal barge in tow, and was immediately followed by the royal yacht and the Black Eagle, having the Admiralty flag flying. Her Majesty and the Prince, having gone on board the yacht, proceeded eastward towards Spithead, followed by the Black Eagle and the Dwarf. As soon as the royal standard was observed by the ships of war anchored at Spithead, the man-ropes were rove, and every preparation made for receiving Her Majesty with the accustomed honours. When opposite Ryde, however, the royal yacht hove-to, and the Dwarf approached for the purpose, as it ap-

peared, of taking the royal party on shore. The royal yacht, at this time, had anchored opposite Ryde pier, close to the Vulcan, one of Her Majesty's preventive steamers, which also lay at anchor there, and which immediately manned her yards, the crew giving nine hearty cheers for Her Majesty, but there was no firing of guns. The cheering from the shore was also very great, but the yacht was too far distant to render it audible to the royal ear. On Her Majesty going on board the Dwarf the royal standard was transferred to that vessel from the royal yacht, and the Dwarf then stood towards the shore in the direction of the pier, having the royal barge in tow. In a few minutes, however, the little steamer altered her course, and the royal barge having been taken alongside, was seen, to the great disappointment of those who crowded the beach, pushing towards them with only one gentleman in the stern, who was conveying a note to Lady Harcourt, whose carriage was in waiting, apprising her of Her Majesty's intention not to land, as originally contemplated. The barge having returned, the royal squadron proceeded on their return towards Cowes, Her Majesty remaining on board the Dwarf steamer, which drawing less water than the royal yacht, kept closer in shore, and enabled Her Majesty to view the varied and beautiful scenery of this interesting part of the coast. Her Majesty reached Mead's-hole, the usual place of embarkation, at sunset, and then proceeded in a carriage to Osborne House. On Sunday morning the Queen, Prince Albert, and the Royal Household, attended Divine service in one of the apartments of Osborne House. Archdeacon Wilberforce officiated, having travelled all night, in order to comply with the commands of Her Majesty, who had requested his attendance for the purpose of performing Divine service. As Her Majesty and Prince Albert were taking their accustomed early walk, about 9 in the morning, which they had extended upwards of a mile beyond the boundaries of the royal domain, they were caught in a heavy shower of rain, at a shelterless part of the hill, commanding a view of the sea. Her Majesty and the Prince hastened their steps homeward, when Scudamore, the old postman of East Cowes and Wippingham, who has for many years been so employed, and who had just been performing his rounds in the adjoining villages, observed that a lady and gentleman were disagreeably exposed to the storm, and running after them as fast as he could, he tendered his old gingham umbrella, which was graciously accepted, and he was invited to follow their footsteps to Osborne House. Little did the poor postman imagine at the time that it was to his Sovereign he had thus the honour of affording such seasonable shelter; but on his arrival at the portico he was agreeably awakened to the fact by having tendered to him Her Majesty's thanks, and a 5*l.* note, together with his old umbrella. On Monday, at 2 P.M., Her Majesty and the Prince embarked at Cowes on their return to Windsor. The harbour was crowded with yachts and boats, and Her Majesty was loudly cheered in her progress towards Spithead. The mode of saluting by the ships at Spithead was different from the usual manner. As soon as the royal yacht hove in sight, the St. Vincent, 120, fired a salvo of eight guns from her starboard side, and then another from her larboard side; the Caledonia, 120, next fired in a similar manner; and after her, the Queen, 110. The Firebrand steam-frigate fired all her guns, and after her all the experimental brigs, one after the other, fired both their broadsides at once. This was repeated several times, and by this means the firing was kept up from the time of the royal yacht arriving at the Motherbank until she passed through Spithead and neared the entrance of the harbour, when the Platform Battery commenced saluting. As the royal yacht passed each ship in succession, the men upon the yards gave Her Majesty three cheers. Upon entering the harbour the Victory and Excellent, with their yards manned, also fired salvos in the same manner as the ships at Spithead. When Her Majesty, upon the royal yacht entering the harbour, saw the garlands of flowers at the trucks of the Victory, and the wreath of laurels on her figure-head, she inquired whether it was usual to deck the ship in that way, and on being informed that the Victory was so decorated, in consequence of its being the anniversary of the Battle of Trafalgar, Her Majesty expressed her intention of going on board. The royal barge, which was waiting to convey Her Majesty to the shore, was immediately ordered alongside, and Her Majesty and Prince Albert, accompanied by Lady Gainsborough and Lord Liverpool, were rowed on board the Victory, and immediately proceeded to the quarter-deck to view the spot on which Nelson received his death wound. The spot is marked by a brass plate, on which is inscribed the words "Here Nelson fell," which was surrounded on this occasion by a wreath of laurel. Her Majesty was received by a company of Marines, who were hastily summoned as a guard of honour, and by Lieut. Jones, who commanded the Victory during the necessary absence of First Lieutenant Smith, who, having been appointed Flag Lieutenant to the Lords of the Admiralty, was obliged to be absent with their Lordships, who were assembled with the other authorities at the dockyard to receive the Queen. Her Majesty, while reading the inscription to the memory of Nelson, shed tears, and remained silent for several moments. She then addressed a few words to Prince Albert, and, plucking a couple of leaves from the wreath of laurel, expressed her desire to see the cabin in which Nelson died. Lights were immediately ordered in the cockpit, and Her Majesty having inspected the poop of the Victory and read the celebrated inscription in front—"England expects every man to do his duty"—which she did with marked emphasis, she descended under the guidance of Mr. Aylen, the master, followed by Prince Albert and the royal suite in attendance. The main deck at this moment was in great confusion, having a few minutes previously discharged a salvo in honour of Her Majesty's arrival in the harbour, and whilst descending, the ladder was run against by a powder-monkey, who was bringing up a fresh supply to salute Her Majesty on her departure. Her Majesty was almost overthrown by the concussion, but bore it with the greatest affability. On entering the cockpit, Her Majesty had no difficulty whatever in descrying the identical spot where Nelson breathed his last; it is pointed out by the figure of a funeral urn emblazoned on one of the knees of the ship, surmounted by the words, "Here Nelson died." The Queen and Prince stopped here for several minutes, and appeared to feel the influence of the recollections which the scene awakened. Her Majesty inspected various parts of the vessel, observing to one of the officers that the orlop deck was not so high in the Victory as in other men-of-war which she had visited. On leaving the vessel, Her Majesty requested that there might be no firing, and having been handed down into the royal barge, took her departure, greeted with three tremendous cheers from the sailors with whom the yards were manned. During Her Majesty's stay on board, which occupied upwards of 20 minutes, the shores were lined with crowds of people, who evinced the liveliest feelings of gratification at Her Majesty's visit to the Victory; the more so as it became speedily known that it was altogether dictated by Her Majesty's spontaneous feelings. It is needless to say, that the disappointment of those who waited Her Majesty's arrival at the Clarence yard was proportionately great at not being witnesses of the interesting proceedings on board the Victory. Her Majesty on landing was received by the Lords of the Admiralty, and the officers of the port and garrison, and immediately proceeded by a special train to the Farnborough station of the South Western Railway, and reached Windsor Castle soon after 7 o'clock in excellent health and spirits.

The Court.—The Queen and Prince Albert since their return to Windsor have enjoyed their usual daily walks in the pleasure-grounds of the Castle, and in the afternoon have either promenaded in the Home Park, or taken airings in an open carriage. During the last few weeks most extensive preparations have been making at Burghley House, the mansion of the Marquis of Exeter, for the reception of Her Majesty, who has signified her intention to visit his lordship in the early part of the ensuing month. The visitors at the Castle this week have been the Earl of Aberdeen, the Earl of Hardwicke, Sir Henry Pottinger, Sir Henry Wheatley, and the Earl and Countess of Westmoreland. Lady Portman has succeeded the Countess of Gainsborough as the Lady in waiting, and the Hon. Capt. Duncombe has succeeded Sir F. Stovin as the Groom in waiting.

The Peerage.—It is well known that Lord Francis Egerton, second son of the late Duke of Sutherland, succeeded to the princely possessions of the Duke of Bridgewater. It is said to be in contemplation immediately to call his lordship to the House of Peers by the style and title of the Duke of Bridgewater.

Winter Assizes.—It is now definitively fixed that a winter gaol delivery shall take place; but it is believed that the subsidiary arrangements will not be made till the beginning of term.

Post-office.—Tuesday's *Gazette* contains a Treasury Warrant, dated the 18th inst., directing that, on and after the 5th of next month, British and Colonial newspapers will be taken in packet-boat to Venezuela, in South America, free of postage; but if in private ship, they will be subjected to a charge of 1*d.* each. A similar permission is granted to Venezuelan newspapers brought to England or the British Colonies.

The Navy.—The following is a list of ships brought forward by the Admiralty, and technically called "advanced ships." Those marked with a * are ordered for "immediate equipment," the others are to be advanced as early as possible. Depots are being formed at the outports for the equipment of merchant steamers; those already selected are Chester Castle, Southampton, Leith, Dumbarton Castle, and Glasgow. Portsmouth is to be a central station for general equipment. The Admiralty will undertake the fitments, and they are to be armed with 32-pounder guns, and 32-pounder carronades:—*Chatham.*—Trafalgar, 120; Waterloo, 120; Ganges, 84; Asia, 84; Achille*, 76; Hercules, 72; Hawke, 72; Russell, 72; Cornwall, 50; Conquestador, 50. *Portsmouth.*—Britannia, 120; Neptune*, 120; Camperdown, 104; Rodney*, 92; Powerful*, 84; Vengeance, 84; Bellerophon, 78; Pembroke, 72; Hastings, 72; President, 50. *Plymouth.*—St. George, 120; Royal Adelaide, 104; Nile, 92; Bombay, 84; Calcutta, 84; Clarence, 84; Superb*, 80; Vanguard*, 80; Foudroyant, 78; Indus, 78; Implacable, 72; Endymion, 44; Melampus, 42. The following is the official list of the ships-of-war now building at the different Royal Dockyards. Many of them are in a very advanced state, and will be launched in the ensuing spring, as a number of men are busily at work in the various arsenals completing them with all expedition:—"At Chatham.—Active, 36; Arab, 16; Bulldog, sloop-steamer; Calypso, 20; Challenge, 18; Chesapeake, 36; Coquette, 20; Cressy, 80; Despatch, 16; Elk, 16; Heron, 16; Irresistible, 80; Kangaroo, 16; Majestic, 80; Mars, 80; Raleigh, 50; and Severn, 50. Deptford.—Spitfire, steam-vessel. Plymouth.—Aboukir, 90; Amethyst, 26; Avenger, st.-frigate; Creole, 26; Exmouth, 90; Flora, 36; Liffey, 50; Niobe, 26; St. Jean d'Acre, 90; Sans Pareil, 84; and Thetis, 36. Pembroke.—Algiers, 90; Arethusa, 50; Atalanta, 16; Britomart, 10; Brunswick, 80; Camilla, 18; Colossus, 80; Conflict, steam-frigate; Constance, 50; Desperate, steam-frigate; Dragon, steam-frigate; Inflexible, steam-sloop; Kingfisher, 12; Liberty, 16; Lion, 80; Mariner, 16; Martin, 16; Squirrel, 16; Sybille, 36; Victoria, 110; and Windsor Castle, 110. Portsmouth.—Centaur, steam-frigate; Dauntless, steam-frigate; Marlborough, 110; Prince of Wales, 110; Princess Royal, 90; Royal Frederick, 110; Royal Sovereign, 110; Scourge, steam-sloop; and Shannon, 50. Sheerness.—Alarm, 26; Dart, 3; and Fury, steam-sloop. Woolwich.—Agamemnon, 80; Amphion, 36; Gladiator, steam-frigate; Hannibal, 90; Hound, 6; Niger, steam-frigate; Odin, steam-frigate; Royal Albert, 120; Sampson, steam-frigate; Sphynx, steam-sloop; and Terrible, steam-frigate. Miscellaneous: Blackwall.—Harpy, Myrmidon, Torch, and Trident, steam-vessels. Bombay.—Goshawk, 12; Madras, 80; Malacca, 26; and Zebra, 16. Glasgow.—Bloodhound, Jackall, and Lizard, steam-vessels. Liverpool.—Vulcan, steam-frigate. Poplar.—Grapple, steamer, and Recruit, brig-of-war." The number of ships of war composing the British navy, either in commission, ordinary, or building, is 681, carrying from 1 to 120 guns each. There are 172 flag-officers, 2 captains on retired half-pay, 716 captains, 50 retired captains, 834 commanders, 299 retired commanders, 2586 lieutenants, 4 superannuated masters, 494 masters, 112 second masters, 56 chaplains retired or entitled to half-pay, 35 chaplains, 46 naval instructors—4 of them chaplains, 284 mates, 8 medical inspectors, 10 deputy medical inspectors, 383 surgeons for service, 270 assistant-surgeons for service, 1 retired medical inspector, 4 physicians, 5 retired deputy medical inspectors, 58 retired surgeons, 1 deputy medical inspector—unfit for service, 200 surgeons—unfit for sea-service, 48 assistant-surgeons—unfit for sea-service, 5 dispensers of hospitals, 30 retired paymasters and pursers, 470 paymasters and pursers on the active list.

Foreign.

France.—King Louis-Philippe is now once more among his own subjects, but the last acts of his visit to England are still the subject of lengthened discussion in the Paris papers. It is amusing to observe the pains taken by the Ministerial journals to discover in the unwonted exertions of the Lord Mayor, Aldermen, and Common Council of the city of London, in going to Windsor to present an address to the King of the French, an event of great political importance. Their departure from previous practice in proceeding to Windsor with the city address is particularly urged by the Ministerial papers as a proof of the real good feeling entertained for France by the English people, and they dwell with equal earnestness on the reception Her Majesty met with when she honoured the Gomer steamer with her presence:—

"The King," says the *Débats*, "before quitting the country in which he has been received with such magnificent hospitality, wished to take leave of the Queen of Great Britain on board a French ship, that is to say, on French territory. Circumstances independent of all human will would not permit the Sovereign of France to receive under his national colours the young and amiable Queen who had given him so many testimonies of friendship. This disappointment, unfortunate as it may appear to be at the time, leaves us now without any regret, since it afforded occasion for a manifestation which the Sovereign and people of Great Britain cannot fail to appreciate with adequate feeling. The King, we are sure, will himself feel his regrets softened on learning the earnestness with which the navy of France became the interpreter of his sentiments. Queen Victoria has kindly gone to receive on board our squadron the thanks which France owed, and was so happy to pay to her, for her most admirable reception of her royal representative. Those noble testimonies of sympathy and admiration which the free citizens of England had spontaneously evinced to King Louis-Philippe, Queen Victoria found reciprocated on board our ships, and by our sailors. Certainly in all times the Sovereign of Great Britain is entitled to be received under the French flag with all the honours due to her person and to her rank. But the welcome given to her on this occasion was more than a natural act of courtesy, it was one of sincere and profound acknowledgment. We are happy at seeing the French navy make itself, in a manner so striking and so honourable, the organ of the whole nation. The acclamations of '*Vive la Reine d'Angleterre!*' repeated with enthusiasm by all the crews of the ships of the squadron, was no more than a faithful expression of the sentiments of their country, and we congratulate ourselves that by this truly national demonstration our navy has so spontaneously and promptly testified to England and her young Sovereign to what a degree France appreciates the affectionate marks of respect of which her freely-chosen King has been the object."

The same paper attaches great importance to the entertainment given at Portsmouth by the officers of the English navy and army to the officers of the French squadron. It says—

"We have no need to say that we set a high value on the magnificent reception given to the King of the French by the Sovereign of Great Britain and her Court; but we will add that we are not the less sensible and proud of what we may call the popular welcome received by our officers in the first military port of our great ally. We see in these spontaneous demonstrations, free as they are from all official character, the genuine expression of the sentiments of the two people. On seeing the *élite* of the French and English officers fraternising in a manner so noble and so cordial, we cannot help saying to ourselves that it is impossible that this good harmony can be disturbed by any fortuitous incidents arising in other parts of the globe. The eccentricities of a sectarian, the intemperance of a chaplain, or the conscientious mistakes of officers who exceed the powers given them, cannot make any alteration in the sentiments of two Governments, or of the people of two nations, who sincerely wish to be on a mutual good understanding. It is impossible that with such extensive and complicated interests as are embraced within the policy of France and England that various points of rivalry and opposition should not present themselves; but it is for the immense advantage of maintaining peace that both parties are disposed to come to an amicable settlement of these inevitable difficulties. The general policy of two great countries can never be at the mercy of such isolated misunderstandings, arising at distances beyond all control or restraint, and these passing dissensions can never be made causes of rupture when no others of a more profound or serious nature exist. No one can doubt that the officers of the two nations who have fraternised at the Portsmouth banquet will

on both sides be ready to do their duty whenever they are called upon, but they will not the less preserve a just recollection of this memorable day; and the admirable example which they have given will, we are convinced, powerfully contribute to keep up in the hearts of the two people those sentiments of friendship which can alone surmount those difficulties which are inherent in the policy of all free Governments, and insure the maintenance of peace, that first great necessity of civilised nations."

The Republican prints, however, join with the other Opposition papers in resenting the alleged proceedings of the King while taking the oath on being invested with the Garter at Windsor Castle. The account of the transaction first appeared in the *Morning Herald*, which stated that when the Chancellor administered the oath the King interrupted him at the passage enjoining him never to wage an unjust or impious war against the Sovereign of the Order, and exclaimed, "No: I never will." The papers attack the whole of this proceeding as derogatory to the dignity of France, and fatal to the defence of her rights; but it appears that the affair is a mere fiction, that no oath whatever was administered, and that the usual admonition contains no such clause as that mentioned by the *Herald*.—The King and Royal Family had not yet on Monday morning returned from Eu. The Duc d'Aumale, who arrived at Paris on Saturday night, had proceeded to Eu to see his illustrious parents. He would, it was understood, shortly leave Paris for Naples, where his marriage with the Princess Caroline of Salerno would immediately be celebrated. The Prince and his bride would thence proceed, by invitation, to Vienna on a visit to the Emperor and Empress of Austria. The marriage of his Royal Highness would, it was expected, be made the occasion of an amnesty for political offenders in the kingdom of Naples. It was even stated that M. Rossi, naturalised a few years since in and now a Peer of France, would arrive there in the course of this month, charged with a mission to induce the King of Naples to grant a Constitution to his subjects—a mission with which M. Rossi was also said to have been intrusted by the French Government to the Courts of Turin and Parma. The motive assigned to this proceeding was to counteract and neutralise the intrigues of the Republican Propaganda in Italy. It is also said that the French Government will grant another amnesty to political offenders in honour of the marriage, and that if Louis-Philippe's wishes be realised it will be a complete one. He is represented to have most warmly insisted upon all such offenders, not excepting Prince Louis Bonaparte, being included in the amnesty proclaimed on the 4th inst., and to have been successfully opposed by his Ministers.—On the Bourse it was said that Ministers felt themselves stronger than at the corresponding period of last year, and that they meant to anticipate the usual time for convoking the Chambers, which has hitherto been Christmas. The motive for that measure would be the great moral effect produced by the visit of the King to Windsor. It was also rumoured and believed that the reported intention of Government to propose to the Legislature to vote a dotation for the Duc de Nemours had been in the nature of a feeler, and that the prejudice against such grant appearing still too strong to be overcome, the proposition would not be brought forward.—"Our private letters," says *Galignani's Messenger*, "acquaint us that Her Majesty and Prince Albert have promised the King to visit Paris in the course of the next year."—Accounts from Morocco state that the Emperor has written Abd el Kader a letter, in which tells him that he is the cause of war and disturbance, orders him to disperse his troops and his *deira*, and to return with his family and the chiefs who have followed him to Fez, where he will receive lands and cattle, but will be obliged to live simply as a Marabout; or, should he refuse to obey the order, he is ordered to quit the territory of Morocco at once. The Emir and the chiefs, it is said, are afraid of placing themselves in the power of the Emperor, who, from fear, might give them up to the Christians; and, it is said, that after long deliberations they have resolved to betake themselves to the Desert, from which they will, no doubt, make pillaging excursions on their enemies in Algiers.—Our readers are aware that a search was made by the police in the hotel of the Duke de Montmorency, in Paris, in the month of June last, and that in the apartment of his son, the Prince de Robecq, were found several busts of "Henry Cinq" (the Duke de Bordeaux), and moulds for casting others. The Prince was brought to trial on Monday last before the Cour d'Assize, for "having in his possession seditious emblems, with the object to propagate rebellion," &c. Notwithstanding the efforts of the counsel for the prosecution, the Prince, who was defended by M. Berryer, was acquitted, and loudly cheered on leaving the court.—The adjudication of the Amiens to Boulogne branch of the French Northern Railway took place in Paris on Tuesday. Only one party, Messrs. C. Laffitte, Blount, and Co., but who are supposed to represent others also, appeared to bid for it. Their proposition, which was conformable to the principle laid down by the Chamber of Deputies, but limiting their tenure to 98 years, 11 months, was of course accepted.—Another chess match for 100*l.* is about to take place in Paris between M. St. Amand, the French, and Mr. Staunton the English player, who beat his opponent in the last match. The papers state that all the preliminaries have been completed by the seconds on both sides, Mr. Henderson and Capt. Wilson for the English champion, and MM. Devinck and St. Elme for his adversary. The conditions, agreed to after some discussion, are precisely the same as those which governed the match of last year, the proposed changes relative to playing King's Pawn two, whether for attack or defence, and some other points, having been rejected. There is, therefore, no restriction as to the manner of opening, time for deliberation between each move, &c. The day on which the play is to commence cannot be at present specified, in consequence of the illness of Mr. Staunton. On his journey from England he caught a cold, which eventually fell on his chest, and caused so much inflammation as to require copious bleeding. He is, however, recovering, but will not, in all probability, be able to go out for a week or ten days, so that the match can scarcely be expected to commence before a fortnight.—A prospectus has been issued of intended English performances in Paris, which are to take place alternately with the Italian operas, and the King has expressed his intention of taking a box for the whole of the representations. Mr. Macready sails from Boston on the 16th inst., and will appear in Paris on the 25th of next month, with Miss Helen Faucit, in Shakspeare's tragedy of *Othello*.

SPAIN.—A telegraphic despatch of the 17th announces that the two Chambers were constituted on that day. M. Morcovo de Altamira has been appointed by the Queen President of the Senate, and M. Castro y Orosco has been elected President of the Chamber of Deputies. The four Vice-Presidents and the four Secretaries have been chosen from the different parties in the Chamber. The Vice-Presidents are MM. Pacheco, Govantes, Aisueco, and Perpina. The business of the Chambers during their previous sittings was confined to preliminary duties and to verifying elections, none of which present much interest to English readers. On the 18th, however, the Cabinet introduced their new Bill for the Reform of the Constitution. The despatch does not give the provisions of this important Bill; but it is understood from other sources that the following are the principal clauses:—1. The preamble of the present constitution is to be suppressed, because it states that the nation, assembled in Cortes, had decreed the constitution, without any mention being made of the royal power, or the part it took in forming the constitution. 2. The Senate, which is at present elective, subject to the approbation of the Crown, is to be for life, and simply on the nomination of the Crown, as is the case with the Chamber of Peers in France. 3. This article is a very important one, and provides that henceforth all political offences, and offences committed by the press, shall *not* be submitted to trial by jury, so that the Government will have the power to stop free discussion. 4. The article respecting the constitution and organisation of the National Guard is suppressed; and some semblance of a National Guard is to be instituted in those districts which, in the opinion of the Government, may require one. 5. The article which requires that the Cortes should assemble every year in the course of the month of December, even if the Sovereign should not call them together, is suppressed. This gives the Government the power of convoking Chambers or not as it may think fit. 6. The clause of the constitution respecting the Queen's marriage is to be entirely remodelled. At present the Queen cannot contract a marriage without the consent of the Cortes. This is to be altered, and henceforth the Queen is only to be required to acquaint the Cortes with the fact of her being about to contract a marriage before concluding it. The Cortes is to have no control over Her Majesty's choice; but a law must be presented to the Cortes, arranging the terms of the contract of marriage. The clause is said to be modelled upon the law of England respecting royal marriages. This last clause is considered as a certain indication that Queen Christina's project of a marriage between Queen Isabella and Don Carlos's son is determined upon. It is said that no other marriage that could be proposed would meet with any difficulty in the Cortes, or make such a change necessary, and that several members of the Cortes objected to this clause, on the supposition that the marriage with Don Carlos's son was the object; but the Ministry has refused to yield. The only other clause of any consequence is one by which that clause of the constitution which forbids the Queen from leaving the kingdom, without the permission of the Cortes, is to be suppressed. This has been also strongly objected to, but the Ministry persists. The above are the principal changes in the constitution proposed by the bill; but great as they are, they are but a small portion of those contemplated by the Cabinet. The ayuntamientos, the provincial deputations, and several other popular institutions, some of which have existed for ages, are to be curtailed or suppressed. The Government does not choose to submit all these matters to the deliberation of the Cortes, and has determined to carry them out by royal decree; and, accordingly, a proposition has been made in the Senate to allow it "to decree some organic laws by royal ordinance."—The unanimity which prevailed in the choice of the committees appointed to verify the qualifications of the Members of the two Chambers was considered as a good omen for the stability of the Ministry.—In regard to the late occurrence at Gibraltar, it is said that no unpleasant consequences need be apprehended from it. The British Minister, Mr. Bulwer, and the Spanish Ministers, Narvaez and Martinez de la Rosa had agreed upon a deliberate and temperate discussion of the matter, and there is no doubt of an amicable termination. On the 13th an event of some importance took place in the Palace at Madrid. Queen Christina was that day married, in her own private apartments, to the Duke of Rianzares, better known as M. Munoz. The ceremony was performed by the Patriarch of the Indies in presence of the Ministers of the Crown. It does not appear that the young Queen was present. Letters from Madrid state that this event is likely to give rise to some difficult questions, and that a Council of Ministers was convoked, to consider what should be done in the circumstances. The principal questions which will come before the Council are—1st. As to the form in which the event will be published. 2d. If the Queen Mother is to be allowed to retain her title, or take that of Duchess of Rianzares. 3d. As to the amount of pension to be settled upon Queen Christina out of the patrimony of Queen Isabella; and lastly, whether or not the Ministry should demand of the Cortes, in the name of a national remuneration and testimony of gratitude to Her Majesty, an addition to the pension to be allowed to her by Queen Isabella, in the event of the sum allowed not being equal to Her Majesty's dowry.—Private letters from Perpignan received in Paris on Monday state that Generals Amettler and Santa Cruz, together with five captains of the Progresista party, had been arrested by the French Douaniers just as they were about to enter Spain. Amettler and Santa Cruz have been sent to the prison of Serres and the others to Perpignan.

PORTUGAL.—We have advices from Lisbon to the 16th inst. The report of the committee appointed to inquire into the use made of the extraordinary powers granted to Government during the late troubles (of which committee the brother of the minister Cabral was a member) was favourable to the Government. The documents referred to in the minister's report of the use made of those powers were moved for, and their production opposed by the Government. The account of the expenditure of the loan of 2000 contos for the suppression of the revolt were likewise moved for, and refused, but promised to be produced at some future period. The report of the committee appointed to inquire into the legislative decrees of the Government, promulgated during the recess, speaks in very doubtful terms of the legality of those measures, but ends by recommending the chamber to grant for that time only a bill of indemnity, in order to avoid greater evils from discordant relations between the legislative body and the Government. A bill introduced into the Chamber of Peers for the abolition of slavery in the Portuguese possessions in Asia, by the Count de Lavradio and the Viscount Sa de Bandeira, was opposed by Ministers, and lost by a majority of 23 votes against 18.—The Serra San Antonio, a mountain district of Madeira, has recently been given up to pillage under the following circumstances:—On the evening of the 16th September 14 policemen, some armed and others intoxicated, attempted to seize Nicolao Vieira, a Portuguese, who, about 18 months ago, had joined the Scottish communion. Their only authority was a warrant, not signed as required by law. Under these circumstances Nicolao refused to follow them until it should be light. His neighbours rallied round him; and, after some altercation, but without a blow being struck by either side, the police retired. On the 23d September 50 soldiers, commanded by Capt. Oliveira, proceeded, under pretence of seizing the offenders, to pillage the district. Some of the houses were gutted, others stripped of their valuables, the live stock was killed, and the inhabitants either taken prisoners or obliged to fly. The houses of two English merchants, Messrs. Burnett and Ellicott, were filled with women flying from the violence of the soldiery. It was not till the pillage had continued three days that those gentlemen obtained, by their urgent remonstrance, an order to restrain the soldiers. 22 prisoners were brought round in a frigate and lodged in Funchal gaol. The pillage was witnessed by several English gentlemen who visited the spot, and its effects are still visible to all who go to the Serra. 10 of the prisoners belong to the family of Maria Joaquina, who is still in prison under sentence of death.

GERMANY.—We learn from Berlin that, on the 10th inst., while the Prince of Prussia was inspecting the buildings at Babelsberg, he fell, and broke both the bones of his right arm, two inches above the wrist. The fracture was immediately reduced, and his Royal Highness was, at the date of this account, doing well. It appears that the Prince has already met with several accidents of the same kind. When a child he lost, by a heavy fall, several of his teeth, which were replaced by a clever dentist. When shooting one day, he was deprived, by an accident, of a part of the first finger of his right hand. One day, at Posen, he struck his head so violently against a beam that an inflammation of the brain ensued. During a stay he made at Mecklenburg a piece of metal fell upon his head and wounded him severely. Whilst at St. Petersburgh he was bitten by a dog, and fell into the Neva as he was going on board a steamer. During a great military manœuvre held at Brunn some years ago, he was wounded in the leg by a gun imprudently fired off. Very shortly since, his carriage was run away with at Frankfort; and shortly after, the Prince himself had a violent fall from his horse. After all these accidents he has again broken his arm, whilst walking in his garden.—We learn from Berlin that the municipality of that capital, having entered into a contract with an English company for lighting the city with gas for upwards of twenty years, and finding that, consequently, there will be no expense created by forming the establishments which would have been required for that purpose, has resolved, instead, to erect a new hospital, sufficiently spacious to receive 600 patients, and suppress all the present smaller hospitals. The cost of the new edifice is estimated at 275,000 dollars. We also learn, by a letter from Berlin of the 14th, that one of the three delegates who were sent out at the expense of Prince Charles of Prussia to examine as to whether the coast of the Mosquitos is sufficiently healthy for the establishment there of a German colony, has returned to Berlin, and the other two are expected daily. Their report is entirely favourable to the pro-

ject. The extent of land which is offered to them is 4,000,000 acres, and the price only 1,000,000 dollars.—From Vienna we learn that Count Maurice Dietrichstein is officially appointed Ambassador to the Court of St. James's, and the Minister *ad interim*, the Baron de Nieumann, who is about to marry the eldest daughter of the Duke and Duchess of Beaufort, is appointed to the Légation de Famille at Florence. Count Dietrichstein will come to England as soon as the necessary arrangements can be effected, and a residence found, the Duke of Buckingham intending himself to occupy Chandos-house, the present abode of the Austrian Embassy in London.—The investigation respecting the officers of the Austrian navy at Venice, in consequence of the treasonable conduct of the brothers Bandiera, is not yet terminated, but seems on the contrary to become more extensive. More witnesses, and persons inculpated, are summoned and examined. The captain of the ship-of-the-line who succeeded Admiral Bandiera in the command of the squadron in the Levant is also recalled.—A letter from Vienna of the 11th inst. states, that the Jesuits were making constant progress in the Austrian territories. Their order had been established with great pomp and solemnity at Venice, in addition to the Jesuits' seminaries at Lemberg, Tannopol, Monsbruck, Gratz, and Linz. The same letter complains of the creation of so many new nobles: as little store as may be set upon nobility in Vienna, this rank confers upon numerous individuals privileges, especially in matters of jurisdiction, and in the conscription, which prove detrimental to the lower and middling classes.—Letters from Clausthal, a mining town in the Hartz Forest, in Hanover, give accounts of a dreadful conflagration, which broke out in that place on the night of the 16th ult., and in the short space of a few hours destroyed a church and several public offices, swept away 213 dwelling houses and a great number of stables and barns, and left 3000 of the inhabitants without a roof to shelter them from the rigour of a northern winter, to which the town of Clausthal, owing to its situation on the top of a mountain, is particularly exposed.—It is stated that a paragraph which has lately gone the round of the newspapers with respect to Prince Leiningen, is totally devoid of foundation, so far as Prince Leiningen, the son of Her Royal Highness the Duchess of Kent, and his family are concerned. At the period when the occurrence in question is reported to have taken place at Mentz, His Serene Highness was residing on his estates at Hohenburg, in Bavaria.—The *Rhenish Observer* states, that the inhabitants of Coblentz and the neighbouring towns had opened a subscription to collect the funds necessary for the purchase of a cargo of Rhenish wine of the first quality, which they propose to send as a present to Mr. O'Connell.—A letter from Frankfort, dated the 17th inst., states that the statue of Goethe arrived the day before on the frontiers of that territory on its triumphal procession through Germany, and made its entry into the city, decorated with flowers and flags of every description. Frankfort-on-Maine was the birthplace of Goethe. The pupils of the Academy of Fine Arts, with their standard, attended by the committee and a band of music, accompanied the statue to the site on which it is to be erected. The very vehicle which had brought this masterpiece from Munich was saluted with loud acclamations. The inauguration of the monument of this celebrated man will take place, it was said, this week.

Belgium.—The opening of the Belgian Chambers took place on Tuesday, the Queen and two infant Princes being present at the ceremony. His Majesty, King Leopold, delivered a speech on the occasion, which is devoid of public interest, being devoted for the most part to local affairs, and containing no information which could interest our readers. A treaty of commerce between Belgium and the Zollverein has just been ratified, and a very serious increase had been made by the Belgian Government in the duties upon silk and cotton manufactures, and also upon machines imported into that country. As regards England, the measure is a most injurious one, as the duties on English cotton and silk manufactures are greatly increased, while the productions of France and the Zollverein are admitted at the present duties. The effect will be to drive the manufactures of Manchester out of the Belgian markets, and to have them replaced by the manufactures of Rouen and Mulhausen. The whole measure is one of the utmost hostility to England.

Russia.—A letter from St. Petersburgh, of the 27th ult., states "that the Imperial family continued to reside at Peterhoff, in great seclusion. Time has not yet diminished the grief that the death of the august daughter of the Emperor has excited in the hearts of all the members of the family."—A considerable portion of the St. Petersburgh and Warsaw railroad is finished, and will be shortly opened. An experimental trip took place over the completed portion on the 29th ult. Prince and Princess Paskewitsch were in one of the carriages. Count Nesselrode embarked at Lubeck on the 12th inst. for St. Petersburgh.—A letter from Warsaw of the 4th inst. states that MM. Tymenzezki and Kaczynski, engineers of this city, had just invented a reaping-machine, which was tried in the presence of the Governor, the Prince de Paskiewitz, and several engineers. The machine worked admirably, and in less than an hour had cut down an acre of oats, and piled up the straw with as much regularity as if it had been done by the hand. Such a machine, of the largest dimensions, would cost about 5000 florins of Poland, or 300*l*.—The *Presse* states, that for more than ten years past there has been remarked a successive diminution of the waters in the north of Russia. The investigations made on this subject by scientific men having demonstrated that this phenomenon has no other cause than the devastations made in the forests, the Minister of the Imperial domains is at this moment occupied in regulating the annual consumption of the woods.—The *Journal des Débats* publishes the following extract from the *Silesian Gazette*, which, it observes, would be incredible if it referred to any other country but unfortunate Poland:—"Some days since there were arrested at Warsaw more than 20 collegians, accused of having formed part of a secret society. The young men, of from 13 to 14 years of age, were transported into the interior of Russia, and the more aged were marched towards the frontiers of Caucasus, to serve as private soldiers in the Russian army."

Turkey.—It is stated that the Porte has seriously come to the resolution to fortify and place in a state of defence the entrances of the Bosphorus and the Dardanelles. Several officers of engineers have declared that the present fortifications are insufficient to prevent an enemy's fleet from effecting its passage, as it could compass its object by landing artillery to destroy the Turkish batteries. Artillerymen, to the number of 3000, will therefore be sent to the Dardanelles, and 2000 to the forts at the entrance of the Bosphorus.—The *Augsburg Gazette* of the 14th inst. states, that a fresh attempt at revolt had taken place in Servia, but had been defeated by the energy of the Government. The object of the attempted insurrection was to restore to power the Obrenowitsch family. It is asserted, that during the last two months preparations had been made on the frontier to accomplish this object. Flags and uniforms had been completed, and a quantity of arms and ammunition was collected. The attempt was made by a person named Jounovitsh, at the head of a band of pretended emigrants, clad in a uniform resembling that of the Servian regiments.

Greece.—Letters from Athens of the 6th state that the King and Queen of Greece had left Athens on the previous day, on a trip of pleasure to Roumelia. Their Majesties were expected back on the 17th or 18th. The whole of the journey was to be made on horseback. The King's *fête* was celebrated on the 30th September, with the usual rejoicings. On that occasion, the Grand Cross of the Order of the Saviour was conferred upon M. Metaxa. The discussions in the Chambers, though of no peculiar public importance, have been very warm. No regular trial of party strength had taken place, and hitherto the Ministry have been in the majority. Gen. Grivas, who was banished from Greece by the last Ministry, finished his quarantine on the 5th, and had landed at the Piræus.

United States.—By the packet-ship Cambridge, we have accounts from New York to the 4th inst. The threatened crusade for the extermination of the Mormonites had assumed an aspect of immediate danger, and the anti-Mormon party of Hancock county, Illinois, had called an armed assembly, to meet at that place on the 27th ult. Prompted by this movement, and in pursuance of his announced resolution, Governor Ford had ordered out 2500 of the State militia for the preservation of the public peace, and to prevent the violation of the constitution and laws of the State. The result has not reached us, but it is highly probable that, finding Governor Ford so determined to quell disturbance, the meeting would not proceed to extremities. Great complaints had been made of the delay in bringing the murderers of Joe Smith to justice. The Governor had intimated that he is ready to sustain the proper authorities in proceeding with the prosecutions.—The papers are chiefly occupied with electioneering speeches and intelligence, and contain little of interest to the European reader. We extract the following from a letter published by Mr. Clay:—"I am decidedly opposed to the immediate annexation of Texas to the United States. I think it would be dishonourable, might involve them in war, would be dangerous to the integrity and harmony of the Union, and, if all these objections were removed, could not be effected, according to any information I possess, upon just and admissible conditions."—At a meeting of the Whig party at Boston, on the 19th ult., Mr. Webster made a long and eloquent speech. Alluding to Texas, he advised that she should continue to be an independent nation, and repudiated the idea that England will seek to acquire any special connection with Texas. He spoke of the fixed determination of the British Government to discountenance slavery, on which a voice in the crowd exclaimed, "They are all slaves in England." Mr. Webster turned quickly on the speaker, and with a flashing eye and indignant voice, asked what blood they, the citizens of the United States, inherited; from whence were the first guarantees of the liberty of the subject derived? He proceeded to say that Mexico had a right to regain Texas if she could do so speedily and promptly; but otherwise a war of petty depredation must be put a stop to by the great Powers. His course on the subject of protection would be the principle, "If you will trade with me, I will trade with you." He would, however, have the hand-labour of America protected against the cheap labour of the operatives of Europe.

CITY.

Money Market, Friday.—Consols for account closed at 100; Red. Three per Cents., 99; New Three and a quarter per Cents., 102; Bank Stock, 202½; India Bonds, 91 pm.; Exchequer Bills, 71 to 73 prem.

GAZETTE OF THE WEEK—BANKRUPTS.—J. Willett, Coggeshall, Essex, leather cutter—C. Till, Salisbury and Andover, linendraper—W. Broome and W. Hardy, Oxford-street, drapers—W. Broome, Oxford-street, linendraper—W. Westrup and T. M. CookseDon, Shadwell and Northfleet, millers—T. Flaherty, Bath, tailor—J. Ashman, Bath, innkeeper—M. Copley, Spalding, Lincolnshire, tailor—J. Simpson, Stockwell Surrey, builder—J. W. Carter, Longacre, coach plater—A. Fowler, Leamington Priors, Warwickshire, builder—J. Gould, Congresbury, Somersetshire, cattle salesman—B. Jones, Birmingham, victualler—W. Walker, Birmingham, hatter.

SCOTCH SEQUESTRATIONS.—J. Hay, Musselburgh, smith—D. Leach, Ardersier, Inverness-shire, merchant—A. Millar, and Co., Stirling, manufacturers—D. Mackintosh, sen., Grahamston, Falkirk, painter—W. Webster, Old Meldrum, merchant—A. Stewart, Edinburgh, horse dealer—A. E. Towart and P. Towart, Glasgow, grocers—J. Runciman, Leith, draper.

Metropolis and its Vicinity.

The Opening of the New Exchange.—The preparations which the Gresham Committee and Corporation are making for the reception of Her Majesty on the opening of the New Exchange on Monday next, are upon the most extensive scale. Her Majesty will arrive at Temple-bar at 12 o'clock. A speech will be delivered, according to custom, upon the visit of the Sovereign to the City, at St. Paul's, by a scholar of Christ's Hospital; and it is believed, if Her Majesty has time to hear it, another will be spoken at St. Paul's School by one of the youths on Dean Colet's foundation, of which place of education the Mercers' Company are trustees. The procession from Temple-bar to the Exchange will be led by a certain number of the Corporation, aldermen and commoners, in full costume, on horseback, in accordance with ancient custom; and it is said that there is to be a procession of the Livery, in dresses of the age of Queen Elizabeth. It is supposed that Her Majesty will arrive at the Exchange about 1 o'clock, and leave the building on her return to Windsor at 3. Her Majesty will appear in state and in the state carriage, accompanied by her Ministers and suite. Most of the distinguished Members of both Houses of Parliament, and all the leading merchants and bankers have been invited. Her Majesty will be received, upon her arrival, at the platform in front of the portico, at the west end of the Exchange, by the Lord Mayor, Aldermen, Recorder, and the members of the Gresham Committee. The procession will proceed through the west entrance, along the south side, and round the ambulatory to the west end again; then crossing the open area from west to east, continuing to the entrance of Lloyd's rooms, in the eastern area of the great staircase and into the lobby. The Sheriffs, Aldermen, and Committee will here fall back right and left, to allow Her Majesty to pass down the commercial rooms, attended by the Lord Mayor, the Chairman and Master of the Mercers' Company. The procession on the return of the Queen into the lobby, will precede Her Majesty into the reading-room to the throne prepared there. Upon Her Majesty taking her seat, the Recorder will deliver to Her Majesty on the part of the Corporation of London and the Mercers' Company, as joint trustees under the will of Sir Thomas Gresham, a suitable address. And in order that Her Majesty may not be inconvenienced, the deputation will not consist of more than 50 persons. After Her Majesty's answer to the address the Lord Mayor will present to Her Majesty the Chairman of the Gresham Committee, Master of the Mercers' Company, the Architect, and the seconder of the address in the Court of Common Council. The whole deputation will then retire to their seats, and the Queen and suite to her private apartments. At the *déjeûner* the Lord Mayor, Sheriffs, the Chairman of the Gresham Committee, and the Master of the Mercers' Company will precede Her Majesty to the royal table, and the Lord Mayor only will attend Her Majesty at the *déjeûner*. The Bishop of London will say grace. At the close of the *déjeûner* Her Majesty will be preceded in the same way down stairs across the open area to her carriage at the great western entrance. The Lord Mayor will then request that Her Majesty will be graciously pleased to allow the New Exchange to be called the New Royal Exchange by the proclamation of heralds in the Merchants' area. The whole line from Temple-bar to Cornhill is to be laid over with gravel. No public vehicle will be allowed to pass through any part of the line after 7 o'clock in the morning; while, to prevent a rush by the people, barricades are to be placed in different parts, through which no one will be allowed to pass except on business. The Lord Mayor on Thursday issued the following order on this subject:—1. That the several streets between Bishopsgate-street and Temple-bar be closed at 7 in the morning; and that no cart, waggon, or other carriage be allowed to remain therein, under any pretence whatever, after 8 o'clock. 2. That no carriage be admitted into any of the streets between Temple-bar and Bishopsgate-street after 7 o'clock, except those going to the Exchange (who must produce their tickets of invitation) or who come within regulation No. 4. 3. That no person be allowed to pass or remain in the Poultry, Mansion-house-street, Cornhill, Bartholomew-lane, or Threadneedle-street, after 7 o'clock, except inhabitants and others going to the houses in those streets, who will be permitted to pass for that purpose until 9, after which time no person whatever will be admitted into those streets. 4. No carriages will be allowed to enter the line of procession between Temple-bar and the Poultry after 10 o'clock, nor to remain after having set down the company, under any pretence whatever, except with an invitation to the Exchange. 5. That the only barriers for the admission of company be Temple-bar, Newgate-street, Queen-street Cheapside (coming over Southwark-bridge), and Moorgate-street. 6. That the clerk of the City Works do take proper measures for stopping up the side streets throughout the whole line of procession, under the directions of the Commissioner of Police. 7. That the barriers for the admission of company be closed at 11 o'clock, and not opened upon any pretence for the admission of company going to the Exchange, except the members of the Royal Family, the Cabinet Ministers, and officers of State, and those engaged in the procession,

who are to precede the same, and that they be not re-opened till after Her Majesty has passed out of the city. 8. That the inhabitants of the several houses in the line of Her Majesty's procession within the city be requested to take particular care that the parapets of their houses are made secure, to prevent accidents occurring to their inmates or the public, by the falling thereof, or by the copings or materials therefrom. 9. That the foregoing regulations be put up in the public streets through which the procession will pass, and that the same be printed, and a copy delivered by the police at each house in the line of procession, from Temple-bar to the Exchange. The Court of Aldermen have also adopted a resolution, that the pavement on each side of Mansion-house-street and the Poultry be railed off from Charlotte-row to the corner of Bucklersbury, and from the corner of Princes-street to the corner of the Old Jewry; and that no person be permitted to remain on the pavement within those limits from 7 in the morning till after Her Majesty shall have quitted the Exchange, except such members of the Livery companies in their Livery gowns as shall produce to the police in attendance a ticket signed by the Commissioner. It is right, however, to add that these regulations have caused great indignation in the city, and that the remonstrances of the merchants and others against the exclusion of the people from the streets will lead to some alteration. Numerous workmen have been engaged during the week erecting seats around St. Paul's Cathedral, St. Clement Danes, St. Mary's, Strand, King's College, and various other public places in the line of the road from Buckingham Palace to the Royal Exchange. The tradesmen along the line of route are also on the alert to accommodate the sight-seers, from whom they will no doubt reap a plentiful harvest, no seats being let at less than 10*s*. 6*d*. each: while near the Exchange as much as 5 guineas have been readily obtained for a reserved place. The day will be observed as a holiday by the principal city establishments. The Directors of the Bank of England have already signified their intention of closing their doors to business operations, and the private bankers have resolved to suspend the attendance of their clerks after 12 o'clock, the previous hours being alleged as necessary for the payment of bills and other affairs which cannot be delayed. The Treasury and the other public offices will be shut, and it is expected that all other leading firms will follow the example so readily set, and make the day one of general holiday and recreation. It is also expected that the Queen, in commemoration of the event, will confer the honour of Knighthood on the Lord Mayor, the two Sheriffs, the Chairman of the Gresham Committee, and the architect.

Portsoken Ward.—On Monday the Lord Mayor held a wardmote for the election of an alderman for this ward in the room of Mr. Salomons, whose election had been declared void by the Court of Aldermen. Mr. Bousfield having retired, there was no opposition to Mr. Moon. Mr. Salomons, however, put in a protest, in writing, declaring that he was rightful alderman of the ward, and that all the proceedings of the meeting were illegal, null, and void. He then addressed the electors at some length, and stated that he should appeal to a court of law to establish his claim. Mr. Moon was then proposed and seconded, and no other candidate appearing, the Lord Mayor declared him duly elected. It is said that Mr. Salomons will cause a *quo warranto* to be served on the new alderman, so that the question will again come before the Court of Queen's Bench and the Exchequer Chamber respecting the legality of the election, as in the case of Alderman Humphrey, on whose election a similar question arose.

Sir James Graham's Medical Bill.—On Tuesday, in pursuance of a resolution passed at the aggregate meeting of the medical profession, held at Exeter Hall on the 29th ult., a deputation of the medical practitioners of the metropolis attended at Apothecaries' Hall, for the purpose of holding a conference with the Master and Court of Assistants of the Company, and to ascertain their opinion with respect to Sir J. Graham's Medical Bill, and the course it would be advisable to adopt on the present occasion. The Master and Court assured the deputation that they adhered to the views which they expressed in their recent statement; that they felt it to be their duty to endeavour, by communicating with the profession, to make themselves acquainted with the real wants and wishes of the great body with whose interests they were more immediately connected, and that they had, for this purpose, watched with great attention the proceedings of the Medical Protection Assembly, and were to a great extent aware of the principle which they recommended. The Court agreed with that body in their leading opinions with respect to the new Medical Bill, and would, when the proper time arrived, be happy sincerely to co-operate with them. The Court, however, were of opinion that associated bodies should move slowly and cautiously, lest they should jeopardise or injure the interests committed to their care. They had given this subject their best attention, and in a few days would again address the profession, and expound the plan of medical reform which they would recommend. This plan was conceived in the most liberal spirit, and conceded the principle of self-government to its licentiates, for which the deputation were such strenuous advocates. The deputation, at considerable length, urged the necessity of protection against illegal practice by summary conviction, and that the welfare of the public as well as the profession demanded it. They also submitted the imperative necessity for the establishment of a college of medicine and surgery for general practitioners, whose acquirements and utility really constituted the profession. The conference then broke up, with the understanding that any ulterior consideration of the subject should be postponed until the official document from the Court appeared.—On Thursday a meeting of the Medical and Surgical Association of St. Marylebone took place, for the purpose of considering a manifesto to be presented to Sir J. Graham, deprecating the bill lately introduced into Parliament, as not effectively excluding quacks from practice, as erroneously opening the field of practice to chemists and druggists, and as prescribing an improper scheme of professional education. The Association also advocate the institution of a college of general practitioners, with an elective council and court of examiners, in order to secure uniformity of education for the general practitioners throughout the United Kingdom. Mr. R. R. Pennington, Senior Fellow of the College of Surgeons, was in the chair, and after some discussion, in which Mr. Cooper and other gentlemen took part, the manifesto was adopted.

County of Middlesex.—At the adjourned meeting of the magistracy on Thursday, the report of the chaplain to the House of Correction was read, stating that during the past year many prisoners on their discharge had found themselves provided with the means of obtaining an honest livelihood, while many also were in the Refuge for the Destitute learning trades, and expressing the greatest gratitude for the benefit thus conferred upon them. The report also adverted to the strong facilities the existing system of pawning offered to the poorer classes for dishonestly disposing of articles. Mr. Pownall congratulated the county on the fact that while since 1831 the population had increased a quarter of a million, crime appeared to have diminished, at least so far as it was brought under the cognizance of the magistracy. The number of persons charged with intoxication was less by 18,000 than in the preceding year. He attributed this mainly to the extension of religious instruction as well in the prisons as elsewhere. Mr. Rotch also expressed his satisfaction at the spread of temperance. The surgeon stated that the mortality had been less last year than in any former year. There had only been 10 deaths among nearly 10,000 persons. The state of the prisons appeared equally satisfactory to the magistracy, who expressed their obligations on this subject to Mr. Sergeant Adams. The rental of the county was returned at about six millions. Mr. Pownall animadverted upon the discrepancy which appeared between the county returns and those to the property-tax commissioners, and said there should be one uniform assessment through the county.

Forgery of Bank Notes.—The discovery of a forgery of Bank of England notes has created great excitement in the city, as it is probable that the fraud has been carried on to an alarming extent. The notes discovered to be forgeries are all for 100*l*., and dated 5th Dec., 1843, and one marked with the letters "Y. E.," although their numbers are different, as if they formed part of a series. "The paper on which they are printed," says the *Times*, "distinguishes this from all similar attempts that have been known for some years. In the ordinary forgeries of 5*l*. notes, the water-mark has been copied on a wooden block, and a mark, sufficiently like the usual water-mark to deceive the unpractised eye, has been made on the false note by intense pressure. In these 100*l*. notes, on the other hand, there is a real water-mark, such as could only have been obtained by manufacturing paper expressly for that purpose. The parties who have seen the notes declare that they are such excellent imitations, that none but experienced inspectors of the Bank of England could detect the forgery, and even those only by the most careful examination. As far as can be learned at present, it seems that the perpetrators of the fraud selected the foreign Bourses as the places where they should give circulation to their forgeries. The notes already discovered have come from Brussels and Antwerp; and it is said that a real note, bearing the same date and letters as the forgeries, and now in the possession of the Bank of England, can be proved to have travelled to Paris. The supposition is, that this note, which was paid into the Bank of England as far back as last June, is the original, from which the forgeries were made as copies. It is, therefore, far from improbable that the paper was made, and the plate engraved at Paris. The whole amount of notes already discovered is less than 1000*l*., but there is no reason to believe that this is the whole extent of the fraud. If the forgeries were copied from the note now in the Bank of England, there has been sufficient time to issue a great number of them, and it is hardly to be expected that so much pains would have been taken for the sake of a limited amount. The foreign Bourses are notorious for the facility with which stolen Bank of England notes are circulated, and considering the absence of immediate check, it is obvious that the facilities for circulating forged notes may be equally great. Every caution, therefore, should be used by merchants and all whose business requires them to receive remittances from the Continent, for it is evident that a party has been at work whose acts it requires the greatest vigilance and acuteness to detect."

Robbery at St. Thomas's Church.—On Sunday last, the church of St. Thomas, Southwark, was the scene of unusual confusion, in consequence of the loss of the whole of the communion plate, which had been in the possession of the parish authorities for the last 200 years. It appears that the plate had been deposited in its usual place of safety at the commencement of the present month, and on opening the safe on Sunday the contents were found to have been removed.

Building Extensions Westward of London.—From a statement made at the Southwark Literary Society, the other evening, on a statistical question, it would appear that within the past three years upwards of 3000 houses have been erected westward of London. In the King's-road, Chelsea, great improvements are in active operation, and in the Brompton-road the new Hospital for Consumption is rapidly progressing, and the western wing, it is hoped, will be ready for the reception of patients early in the ensuing year.

Excise Seizures.—Within the last few days a seizure of a most extensive character has been made by the excise officers in an ale and porter brewery of considerable standing, but in rather an obscure district of the metropolis. From information received, the surveying examiners and an officer of excise proceeded to the premises, and made a diligent search, and the result proved that their information was perfectly correct, as they found a large quantity of the ingredients commonly used in the adulteration of beer, and which may almost be considered as a substitute, though a most pernicious one, for both malt and hops; viz., Coculus indicus, grains of paradise, liquorice, &c.; in the whole numbering six descriptions of unwholesome drugs, the whole of which were seized, and samples taken and sealed in the presence of all parties, besides samples of the beer. This case, it is said, will be defended by counsel, and be heard at the next sittings of the Court of Commissioners.

The Cutaneous Infirmary.—The inhabitants of Bridge-street and its neighbourhood are still actively engaged in opposing the establishment of this infirmary in their crowded thoroughfare. The Committee of the Apothecaries' Company have withdrawn the permission (conditionally granted) of supplying hot water to the infirmary, and a communication to that effect has been forwarded to the secretary of the institution.

Her Majesty's Ship Rattler.—This fine steam-frigate, after having made a great variety of experiments with the different propellers that have been projected by Mr. Smith, Mr. Woodcroft, Mr. Blacland, Mr. Steinman, Mr. Sunderland, and other persons, in order to ascertain their comparative merits, made her final trial in the river last week. The screw that has been found to produce the highest rate of speed with the smallest consumption of power is that of Mr. Smith, known as the inventor and adapter of the Archimedean screw. The Admiralty have in consequence determined to send the Rattler to sea, fitted with a propeller in accordance with the suggestions of that gentleman. The trial of last week gave an average speed of 11¼ statute miles per hour. The Rattler is 688 tons, and 200 horse-power; and her sister ship, the Prometheus, similar to her in every respect with the exception of having paddle-wheels, has only reached 8¾ knots an hour. The Rattler is to be fitted for sea immediately; and, in consequence of her success, the Admiralty have given orders for six other iron steam-ships, of a large class, to be forthwith constructed on the same principle.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Oct. 19: West Districts, 145; Northern, 140; Central, 185; Eastern, 180; Southern, 245; Total, 895. Weekly average for the last five years, 946.

Provincial News.

Atherstone.—On Saturday night, between 12 and 1 o'clock, the dwelling house of Mr. Thomas Worthington, at Mancetter, near this town, was broken into by a gang of ruffians, wearing black masks, and disguised by black linen, which they wore over their clothes. The house is in a very lonely spot, and a considerable distance from any other dwelling. The burglars commenced their operations by cutting a hole in the front door, the noise of which disturbed Miss Worthington, who opened a window and inquired what they wanted, on which the burglars said the cows had escaped from the close; but Mr. Worthington, who had now joined his niece, seeing a gang of five or six fellows, ordered them to be off about their business, or he would shoot them. Of this the burglars took no notice, but continued their operations against the door, and at last succeeded in making an opening. The inmates, consisting of Mr. Worthington, a niece, a grandniece, and a servant lad and maid, were by this time fully prepared, and Mr. Worthington, who is in his 89th year, placed himself at the door, and with a drawn sword cut and stabbed at the fellows through the hole they had made, and kept them at bay for a considerable time. Finding they could not obtain admittance in this way, the burglars battered the door to pieces; but while they were doing so, Miss Worthington brought her uncle his fowling piece, which was loaded with swan shot, and desired him to shoot the villains, and seeing that his aged hands shook so that he could not take an aim, this courageous lady actually pointed and held the gun while her uncle fired. This did not deter the burglars, but, finding the inmates so resolved they tore up the stones in front of the house, and threw them at the old gentleman and his niece, who still kept their places in the hall, defending the entrance; when, at length, after half an hour's fighting, and no assistance appearing, and Mr. Worthington being wounded in the temple and in various parts of the body, his niece, who stood firmly by his side during the conflict, parleyed with the robbers, and asked whether they wanted their lives, when one of them, who acted as spokesman, said all they wanted was money, and they did not want to hurt them. The lady then said, if they would promise not to hurt her uncle, no further resistance should be made, which the robbers promised; but the old gentleman still continued resolute, and stood at the door with his sword, threatening to cut down the first who approached, the blood all the while pouring

down from the wound in the temple, when the niece, fearing he would bleed to death, threw herself upon him, and took away his sword, which was covered with the blood of the burglars, on which four of them made their way into the house, and after making the servant lad give up all his money, they next took from the grandniece of Mr. Worthington, a young lady about 15 years old, all the money she had, threatening to hang her if she did not keep quiet. They then forced the niece to show them where the money was kept, which they took, as well as some fire-arms; and after threatening the inmates, if they made any noise about the robbery or took any steps to discover them, they would come again some night, burn the house, and murder all the inmates, they took their departure, and as yet no traces have been obtained of them. Neither Mr. Worthington nor any of his family are seriously injured, and it is hoped that justice will not be long in overtaking the ruffians, for whose apprehension a reward of 100*l.* has been offered.

Bedford.—We regret to find that incendiary fires are again common in this county. Last week, fires more or less serious in their character broke out on the farms of Mr. Isitt and Mr. Wing, between this town and Fenlake, on the farm of Mr. Lambert, of Fenstanton, and on that of Mr. Whinnett, of Wingfield, by which a large quantity of valuable property was destroyed.

Birmingham.—A meeting of the inhabitants of this town and neighbourhood was held in the Town-hall last week, Mr. W. Beale in the chair, for the purpose of making preliminary arrangements for a town meeting to consider the best means of providing public walks and baths for the use of the inhabitants. Alderman Cutler opened the proceedings by detailing the acts of the select Committee of the House of Commons appointed to consider the best means of providing places of recreation for the inhabitants of populous towns. On the report of this committee being made, the House granted, at two different periods, the sum of 15,000*l.* to aid the inhabitants of large towns in the formation of public walks and places of recreation. Alderman Cutler also stated the correspondence which had taken place between the corporation and the Government on the subject; after which, resolutions in furtherance of the objects in view were unanimously passed.

Brighton.—On Monday, pursuant to a requisition to the High Constable, a public meeting was held in the Town-hall in order to consider the propriety of petitioning the Queen in Council for a charter of incorporation for this borough. The High Constable having been called to the chair, it was moved that a committee be appointed to take into consideration whether it will be beneficial for the inhabitants that the town should be incorporated, and also the propriety of presenting a petition to Her Majesty under the provisions of the Municipal Amendment Act, and to report thereon to an adjourned meeting, to be held in a month's time, which was carried unanimously, and a committee accordingly appointed. The requisition was signed by upwards of 400 inhabitants.

Bury St. Edmunds.—At the Tuesday meeting of the Suffolk Quarter Sessions there was a long debate on the establishment of a rural police, which was moved by Mr. Bevan. The Chairman having again read the resolution, a division took place, when the numbers were—For a rural police, 29; against it, 16. The magistrates then retired from the bench to make arrangements for appointing the force, both as to its number and the amount of wages to be paid.

Chatham.—For the last two months the Royal Engineer establishment, under the direction of Lieutenant-Colonel Sir F. Smith, have been engaged in preparing a system of countermines in front of the ravelin on the left of Chatham lines, for the object of carrying on the course of drill in subterraneous warfare. The corps of Engineers will be divided for this occasion into distinct parties, one representing the besiegers, and the other the defenders of the fortress, the operations to consist chiefly in mining against each other. On Tuesday the operations commenced by the besieged firing an under-charged mine for the purpose of arresting the progress of the attack. The charge contained 90 lbs. of gunpowder, and was merely sufficient to shake the gallery of the besiegers. This caused both parties to resume the excavations of their galleries with increased activity, and it is expected that in a few days they will be ready to explode fresh charges; in the meantime everything is to be done as if in actual service; for this object both officers and men are working by reliefs throughout the night. The number of Sappers and Miners thus employed is about 200, with a full proportion of engineer officers. During the day a considerable number of persons were present to witness this interesting siege, including many leading officers of the army and navy. Some of the mines to be exploded will contain about 300 lbs. of gunpowder.

Chichester.—The Lord Bishop of Chichester (Dr. Gilbert, late Principal of Brasenose College, Oxford) commenced the primary visitation of his diocese on Tuesday, in the cathedral church of Chichester. The charge has been looked for with great interest, as it is the first occasion which his lordship has had, since his elevation to the episcopal bench, for announcing his views on the present state of the church. After entering at some length into the local affairs of the diocese, his lordship dwelt with particular earnestness on the necessity of encouraging the movement in favour of education. He then adverted to the condition of the poor, insisting strongly on the importance of improving their dwellings, and of paying their wages on the Thursday instead of the Saturday. The following extract contains his lordship's sentiments on these points, and on the Tractarian party:—

"If masters could pay the persons in their employ on Thursdays, instead of Saturdays, I believe many a victim of intemperance would be saved, their comforts increased, and more attention paid to the Sabbath day. The farmers of Sussex, and other employers of the poor in this diocese, are doing much for the improvement, morally and spiritually, as well as for the external condition of the labouring population. Let me, through you, the clergy, entreat them to add this to their other good deeds in their behalf, showing them at the same time that they will reap their reward in more ways than one. And I need scarcely remind you, my reverend brethren, that in the olden time, in many of our institutions, the week ended on Thursday. I am not ashamed to introduce such subjects to your notice, nor do I think they are at all alien to the present occasion; for in how many ways has not God set forth the duties of his servants, cautioning us lest we fall into the ways of those who neglect them altogether. It is not my intention to speak at any length on these subjects, which, in some degree at least, are dividing Churchmen amongst themselves. Let me, however, guard you, the younger clergy especially, against the error of selecting authors and reading them, not with a view to impartial judgment on disputed points, but simply for the purpose of culling arguments which may tend to the recommendation of preconceived notions. Men who act in this manner place themselves at once in danger of becoming inseparably engaged in the maintenance of a position which they had no intention originally of taking up. Such is, in fact, the history of the rise of the party in the Church to which I am now alluding. Its founders had no other intention at first than to raise a barrier against the threatening aspect with which the State at that time appeared to view the Church. In pursuing that object they had recourse to those writers who favoured most the pretensions of the Church to independence. From this armoury they supplied themselves, and continued to be led on by the pressure of those principles, until they were at length landed in a position far removed from that which they originally contemplated, and which I do not wish to characterise further than by pointing to it as a warning; for it is not to be denied that several of them now find a difficulty in reconciling the opinions which they promulgate with the allegiance they owe to the Church; nay, some of them have spoken of our Church harshly and unadvisedly, and one has of late poured upon her unmeasured contempt and contumely. Judging from a review of their progress, as given by one supposed to be of their number (the Rev. W. Palmer) one must arrive at the conclusion that these, so long unable to form their own course, must be especially unfitted to guide others in the formation of their theological opinions. With respect to some usages which are supposed to take their origin from this school, it is much to be desired that more correct notions should prevail, more especially amongst the laity. Whatever may have been the object or intention of those writers of whom we speak in reviving attention to those matters, the advocates of rubrical observances are more frequently found in the persons of those who have no sympathy with their doctrines or peculiarities. The laity should be made aware of this fact. At the same time, I must caution the clergy always to bear in mind that the edification of God's people is the object of all their ministrations, and that they will sacrifice the end to the means if they needlessly offend their congregations in such matters. I will not say that the interests of religion would not be advanced if our ritual were brought back to what it formerly was. On the contrary, I believe the reverse would be the fact; but I certainly am convinced that a minister takes a wrong and entirely inadequate view of his duty if, by adhering too strictly to the rubrical directions of the Book of Common Prayer, he alienates the affection of his congregation. Let him fully and clearly explain its nature and uses, and so he will win their minds towards him. From the time I entered this diocese, I have been continually consulted by individuals amongst you on these matters, and they will remember that in this spirit I have always thought it my duty to give this advice."

Clifton.—The Bristol *Gazette* mentions under the heading "Woes of Wealth," that Miss Burdett Coutts has taken one of the houses in Lansdown-place, Clifton, having been so much importuned for charity in other places, that her doors have been beset by needy or designing persons, that when taking an airing she has been unable to avoid the importunate supplicants.

Eton.—On Saturday week the Duke of Wellington, whilst on a visit to Her Majesty at Windsor Castle, walked to Eton College, accompanied by the Duke of Rutland, for the purpose of inspecting the room in the house of his "dame" which he occupied when an Eton boy. The house, known as the Manor-house, is now in the occupation of the Rev. Mr. Bulston, one of the masters of the College, and the "Duke's room" is occupied by an Etonian, the son of Mr. Hankey, the banker. The noble Duke remained in the room some time, contemplating the scenes of his Eton days, and was much gratified in recognising and pointing out to his companion several relics which were familiar to his recollection, although it is 65 years since he occupied this apartment.

Leeds.—A vestry meeting of the ratepayers of the township of Hunslet, near this town, was held last week, the Rev. J. Clark, incumbent of Hunslet, in the chair, when it was unanimously resolved, that the money (about 1000*l.*), which was paid by the North Midland Railway Company as a compensation for the land required for their works passing over Hunslet-moor, should be placed in the hands of trustees and under a committee of management, with a view of either purchasing or renting land, and reletting it to the labouring poor in suitable plots for gardens, or employing the able-bodied poor when out of work during depressions of trade.

Liverpool.—The occasion of laying the foundation-stone of the docks at Birkenhead, intended by the projectors as a kind of rival to Liverpool, has created a great sensation in this and the surrounding district. Although there has been no particular complaint of the want of dock accommodation at Liverpool, it has been deemed a matter of infinite importance to the Cheshire side of the river to form docks in that neighbourhood, whence projected railways and various other means of forwarding the views of commerce are contemplated. The town of Birkenhead itself, which comprises Woodside, Monk's Ferry, Tranmere, and other places, has for some years been laid out in streets, and the township now commands the general attention of the inhabitants at large of this part of the country. Tuesday was appointed for laying the foundation-stone of these docks, and such a numerous assemblage of individuals was never previous congregated on the Cheshire shore. A grand procession was formed of the principal inhabitants and authorities to see the spectacle of laying the first stone, and every window in its line was filled. The procession left the Town-hall at 11 o'clock, and proceeded round the New Park, and after parading the principal streets, halted in the field where the first stone of the anticipated future prosperity of Birkenhead was to be laid. A vast number of individuals were congregated upon the spot, and on the approach of the procession, with Sir Philip Egerton at its head, the most enthusiastic cheers were given. The stone having been lowered into the place destined for its reception, Mr. Randell, the engineer, delivered a short but appropriate address to Sir Philip Egerton. The Hon. Baronet descended from the platform, and having completed the process of laying the stone, addressed the company in an eloquent speech, which was loudly cheered. Having made some appropriate introductory observations, the Hon. Baronet took a rapid but interesting retrospect of the history of Birkenhead. In the time of his grandfather, and only 50 years since, it did not contain more than three houses; in 1801 these had increased only to seven; and at intervals of ten years, until 1831, its progress was scarcely perceptible. In 1841 it began to give some signs of decided progress; and now it presented the scene they now witnessed—the town having lines of streets, amounting to 30 miles in extent; a harbour and docks in course of formation which would far exceed, in their means of accommodation, any now in existence in any part of the kingdom; and these so aided by the remarkable facilities which nature has afforded, that the amount of outlay, though large, would be comparatively small. The Hon. Baronet then proceeded to indulge in predictions of Birkenhead's future greatness, and presented a sketch which not merely derived probability, but became certainty, from the knowledge of what had been already realised. The Hon. Baronet concluded a very interesting address by a fervent wish, which was responded to by the cheers of the assembled thousands of spectators, that the most sanguine hopes of the projectors might be realised. The workmen and their families were subsequently regaled with substantial fare, and the proceedings of the day terminated with a grand dinner to the company, followed by a ball in the evening.—On Monday last the fine barque Hermes, Capt. Donough, belonging to this port, which sailed on Friday for Buenos Ayres, put back from Holyhead in consequence of a daring attempt made by one of the crew to burn her when about 9 miles from Holyhead. The man, who is a Swede named Brown, was at once taken into custody and remanded for further evidence. It appears that he had ignited a tar barrel and bundle of oakum in the forecastle, but fortunately the attempt was discovered in time to prevent the destruction of the vessel.

Manchester.—Sir Geo. Philips has contributed 500*l.* to the fund raising for the new public park in this town. The total amount of the subscriptions is nearly 24,000*l.*

Newcastle.—Another explosion of fire-damp, so frequent in this district, occurred on Monday night at Walls-end. The explosion took place in a drift at the end of a "board," on the underviewer going in to examine the workings. It appears the board had been carried forward to a dyke or trouble, the stratum of coal rising at this part some feet, and the drift was made by excavating the roof to reach and continue the seam of coal. The underviewer going in with a candle, the gas fired, and he and another party were severely burnt; but no other injury took place. On Wednesday another accident occurred at Hetton Colliery, and indeed explosions are almost of daily occurrence, though rarely so fatal as that at Haswell.

Oxford.—Within a short time three more members of this University have left the establishment and embraced the Roman Catholic religion:—Mr. George Tickell, B.A., of University College, and recently one of Lord Stowell's law fellows of University College, Rev. Mr. Barton, and a gentleman, a student of Christ Church, whose name has not yet transpired. Mr. Tickell was received into the Roman Catholic communion at Bruges, about a fortnight since.

Portsmouth.—It is announced that it is Her Majesty's intention to grant an annuity to the widow of the unfortunate artilleryman, Walker; and the chief engineer of this garrison is directed by Her Majesty to make every inquiry into the circumstances of the widow prior to the settlement of the sum, which is stated at 30*l.* per annum. His Majesty the King of the French, on hearing of the accident, was much shocked, and stated his intention also to provide for the widow.—Admiral Bowles has hoisted his flag in the Caledonia, 120, as Commander-in-chief of the Experimental Squadron, which is ordered to proceed to sea for six weeks or two months. They will cruise between the coast of Portugal and the Western Islands; and if bad weather come on will run to the southward,

Rowley Regis.—On Saturday last a calamitous explosion of fire-damp took place in a coal-pit belonging to Mr. Darby, at the Five Ways, Rowley Regis. The number of persons at work in the pit is understood to have been 17 or 18, and of these no less than 11 were killed. Immediately after the explosion, the effects of which were perceived at some distance, measures were taken to afford assistance to such of the workmen as might be alive, and six of them were extricated from their perilous situation. In a short time the dead bodies of eight workmen were got out, those of three others being left in the pit in consequence of the foulness of the air. The six poor fellows who were got out alive are all more or less injured, but not to such a degree as to endanger their lives.

Rochdale.—The threatened introduction of the New Poor Law into the heart of the manufacturing districts has had the effect of raising a considerable commotion amongst the people of Ashton, Oldham, and Rochdale, who are strenuously opposed to the Poor Law being introduced into their respective parishes. A meeting convened in accordance with a requisition signed by nearly 3000 ratepayers was held on Monday in this town, Mr. Leach, the high constable, in the chair, at which the following resolutions were unanimously adopted:—1. That it is the opinion of this meeting that the introduction of the New Poor Law into this Union will be injurious to the best interests of its inhabitants; that it will not only entail heavier expenses on the ratepayers, but that it will be vexatious and oppressive to those who through necessity are compelled to apply for parochial relief. 2. That this meeting does most emphatically declare that the parochial business of the townships comprising this Union is conducted in a very satisfactory manner, and agreeable to the ratepayers; that the introduction of the New Poor Law is entirely uncalled for and unnecessary, as evinced by the numerously signed requisition of the principal ratepayers requesting the chief constable to convene this meeting. 3. That it is the opinion of this meeting that it is the duty of the guardians, and that they be requested immediately to memorialise the Commissioners, and likewise the Secretary of State, against the introduction of the measure into this district, and that a copy of these resolutions be conveyed with such memorial. 4. That this meeting pledges itself to support the guardians in all legal measures taken to resist the introduction of the New Poor Law into this Union. The meeting took place in the open air, and was attended by thousands of people; and it is said that the requisition would have contained many more names, and those of the most respectable inhabitants, but there was not type in the town to set up their names.

Stratford-upon-Avon.—It is well known to all who have visited this town, that several of the old inscriptions on the monuments or stones to the memory of Shakespeare's family have been so obliterated by time, or the feet of visitors, as to be scarcely legible. The Rev. W. Harness, having recently spent some time in the native town of our great dramatist, at his own expense has caused all the inscriptions to be retouched and restored, so that they now appear exactly in the state in which they originally stood, and can be easily read by anybody acquainted with the forms of our old letters.

Wakefield.—Another colliery explosion took place last week in the colliery of Messrs. Micklethwaite and Co., near this town, at which time three men were at work in the pit. Two of the men were killed by the explosion; and when their bodies were brought to the bank they were found to be literally burnt to a cinder. The jury after a long inquiry returned a verdict of Accidental Death. The explosion is supposed to have been occasioned by one of the deceased having removed the top of his lamp, but there was no direct evidence upon the subject. At Sunderland last week three pitmen were brought before the magistrates, charged with having drawn the flame through the Davy lamps for the purpose of lighting their pipes, and committed to Durham House of Correction for three weeks.

Warwick.—It is generally known that some years ago, the proceedings contingent upon a long-protracted claim made by an individual named George Leigh, as the lawful heir to the estates of Lord (then Mr. Chandos) Leigh, at Stonleigh, in Warwickshire, were brought to a termination by a decision of the House of Lords in favour of the present possessor, Lord Leigh. Recently, another claimant has started up in the person of John Leigh, upwards of 50 years of age, and residing at Chowbent, about five miles from Bolton, in Lancashire; who with his supporters has been locating at Coventry, five miles from the Abbey, for several weeks past, in quest of evidence to substantiate his claim. On Monday morning, the new claimant, with his heir, James Leigh, Thomas Hopwood (describing himself as a descendant of Christopher Leigh, from whom the last claimant founded his right to the Stonleigh domain), and 29 others, proceeded through the old lodge gate, arm in arm, to the Abbey, which was guarded at all points by officers of police and labourers employed upon the estate. After several attempts to effect an entrance, the intruders attacked the officers and overpowered them. They then broke down a door with a crowbar, and obtained forcible entrance into the mansion. Some of them immediately barricaded the door by which they had entered, in order to keep undisturbed possession, which, by these means, they maintained for upwards of an hour—some remaining in the housekeeper's room, and others in the passage leading to the various domestic apartments. During the affray the alarm bell was rung, and in a short time the principal portion of the Stonleigh tenantry, together with an immense number of persons from Coventry, Leamington, Warwick, Kenilworth, &c., were congregated on the lawn. The police also arrived, and the ringleader, John Leigh, said that having gained what they wanted, they would go to prison or anywhere they liked. The officers immediately took into custody the whole of the offending parties. In one corner of the housekeeper's room were found several bludgeons and sticks of formidable appearance. None of the party made the slightest resistance, but quietly suffered themselves to be handcuffed, and were conveyed in waggons to the Town-hall, Leamington. The arrival of the prisoners created great excitement, many thousands of the inhabitants being congregated in the streets, where they awaited, with intense anxiety, the result of the examination, which lasted for several hours, and ended in the committal of the prisoners to the county gaol, to take their trial.

York.—The inquest on the body of Mr. Inchbald, the farmer, who was murdered at Low Dunsforth, near Boroughbridge, as stated in our paper of the 5th inst., has terminated in the committal of William Kendrew, to take his trial on the capital charge, and of his brother as accessory before the fact. The prisoners were apprehended at Newcastle.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2888*l.*; Bristol and Gloucester, 1123*l.*; Eastern Counties, 4594*l.*; Edinburgh and Glasgow, 2652*l.*; Great Western, 19,423*l.*; Grand Junction, 8776*l.*; Glasgow, Paisley, and Ayr, 1545*l.*; Great North of England, 2093*l.*; London and Birmingham, 18,033*l.*; South Western, 8041*l.*; Blackwall, 943*l.*; Greenwich, 826*l.*; Brighton, 5552*l.*; Croydon, 461*l.*; Liverpool and Manchester, 5059*l.*; Manchester, Leeds, and Hull, associated, 7695*l.*; Midland, 11,786*l.*; Manchester and Birmingham, 1184*l.*; Newcastle and Carlisle, 1783*l.*; Newcastle and Darlington, 1153*l.*; Preston and Wyre, 384*l.*; South-Eastern and Dover, 6349*l.*; Sheffield and Manchester, 682*l.*; York and North Midland, with Leeds and Selby, 2800*l.*; Yarmouth and Norwich, 335*l.*—The Board of Trade has just issued a circular to the several railway companies, calling their attention to the danger of the plan adopted on some railways of running excursion trains drawn by several engines. They state that the opinion of several experienced practical men has been taken, and that they all state the present mode of working the excursion trains to be extremely dangerous; and the Board of Trade recommend that these excursion trains should be divided into sections, so that no more than two engines should be used with any one train of carriages. They also point out the extreme danger likely to arise from the want of punctuality in the arrival of these excursion trains, arising from their great weight; and they strongly urge upon the companies to adopt a different mode of working the excursion trains in order to avoid the danger of the present method.—The Irish papers state that on account of the great number of railways brought forward in Ireland, the Board of Trade will recommend that a commission, similar to that of the late Mr. Drummond's, should be issued, to inquire and report upon the various rival lines. The late Act gives to the Board of Trade a veto upon all new lines, but the number is now so unprecedented in all parts of the empire, and there are so many conflicting lines, that the Board consider they would be totally unable to deal with the subject satisfactorily without some such assistance as a commission in Ireland.—The Eastern Counties Company intend to start on Monday next a train composed of third-class carriages only, to leave London early in the morning for Colchester, and return to town late in the evening, for the poorer classes, who, in pursuance of the recent Act of Parliament, are to be charged only one penny per mile. A similar train will traverse the Cambridge line daily.—A meeting to consider the plans proposed for affording railway communication to the Potteries took place on Friday at Stoke-upon-Trent. The secretary to the Grand Junction Company proposed a line to start from Stoke, pass through Etruria, leaving Hauley to the right and Newcastle to the left. The grand point was to get a line to Liverpool. The line would pass Stoke and Stow to Stafford. The Chairman of the Chester and Birkenhead Company said they were prepared to co-operate in forming a line from Birkenhead through the Potteries to Rugby, and this the meeting approved of.—An influential meeting of the supporters of the South Wales Railway was held in Newport last week, Mr. Blewitt, M.P., in the Chair, supported by Mr. Bailey, M.P. for Worcester, and other Members of Parliament. A resolution was agreed to that the formation of a railway through South Wales to the port of Fishguard, for the purpose of affording the means of communication between this important district, the South of Ireland, and the Metropolis, forming a line of junction with the northern and southern railways of England, would be of incalculable public advantage, and deserved the warm support of the meeting.—The Kendal and Windermere Railway, against which the inhabitants of the district, and the Poet Laureat so loudly protest, is to be supported in the House of Lords by Lord Brougham, and in the House of Commons by the Hon. Colonel Lowther and Alderman Thompson.—A meeting of the most influential landowners of the county of Lincoln was held in the Town-hall at Bourn on Saturday, "to consider and determine upon the best means of promoting the projected line of railway from Cambridge to Lincoln," being a portion of the intended line from the former town to York. General Johnson, M.P. for Oldham, took the chair. It was stated that the works would join the London line at Clay-farm, three miles south of Cambridge, proceeding northward to St. Ives, thence to Ramsey and Peterborough, which city it would pass as closely as possible, and probably through it. Thence by Market Deeping it would be continued within a short distance on the east to Bourn, so as to get round the high lands close to Lincoln. It would then pass by the hollow of the valley watered by the river Witham on to York. It was intended to make branch lines from Boston to Sleaford and Newark, and from Spalding to Stamford. The applications for shares had been almost innumerable. The list was already full, and the committee of management had rejected upwards of 30,000. The cost would be comparatively trifling from the flatness of the locality. It was estimated that the works might be constructed for 12,500*l.* per mile—but little more than half the sum usually expended. Resolutions in favour of the line were unanimously adopted.—A meeting took place at Windsor last week, the Rev. Dr. Hawtrey in the chair, to consider the propriety of forming a new atmospheric line direct from Windsor to London, with a branch from Windsor to the Great Western at Slough. Resolutions in favour of the line were unanimously adopted, and the engineers were directed to complete the surveys. The plan of the line has been submitted to the Queen, who is said to approve of the undertaking; and Her Majesty is expected to consent to a slight encroachment in the Home Park between Windsor and Datchet bridges, in order to facilitate its construction.—A decline has taken place in Great Western shares, which is accounted for by the appearance of the prospectus of this new line from London to Windsor, and also of a line from Exeter to Falmouth, which, it is said, will be worked in conjunction with a line supported by the South Western directors, to be made from Salisbury to Exeter, and from Exeter through North Devon to Bodmin, Truro, and Falmouth.—The directors of the Sheffield and Manchester Railway have come to an arrangement with the Midland Counties and the Manchester and Birmingham Companies, for the lease of their line. A meeting of the proprietors is to be called immediately to confirm the terms agreed upon.

IRELAND.

Dublin.—Mr. O'Connell's recent declaration in favour of Federalism has excited the greatest interest among all parties, but has not been well received by the repealers. The two leading journals of this city have announced their opposition to it, and Mr. Duffy, editor of the *Nation*, and one of the state prisoners, has published a long letter to Mr. O'Connell condemning as dangerous and inexpedient any junction of the Repeal Association with the Federal movement. The provincial Repeal papers on the contrary, with few exceptions, have announced their intention to adopt Mr. O'Connell's change of views. A Whig weekly paper assures its readers that an important movement is in contemplation in reference to federal legislation for Ireland, and adds, that in the course of the next week decided steps will be taken to bring the subject under public notice.—The weekly meeting of the Repeal Association was held on Monday in Conciliation Hall. The chair was taken by Counsellor Mackey, who briefly addressed the meeting, confining his observations to the registry, and congratulated the Association on the success which had attended its exertions. Dr. Nagle read a letter from Mr. H. Grattan, M.P., which accompanied a presentation of 100 copies of the memoirs of his father, the late Mr. Grattan, to the Association. The letter went at considerable length into the policy of establishing Repeal reading-rooms through the country, and dwelt on the benefits that would unquestionably be derived from them. The writer contrasted the extensive system of education that prevailed in America with that existing in this country, and then observed, "that it would be for the Association to follow up the great example afforded by that country, and forward the establishment of libraries everywhere, and support these reading-rooms throughout the country. With that view I beg to place at the disposal of the Association 100 copies of the Memoirs of the late Mr. Grattan, amounting to 400 octavo volumes. They comprise the most interesting period of Irish history; they set forth the proceedings of 1782, and detail the successful efforts of the glorious and immortal volunteers; they contain authentic letters of the ablest statesmen in Ireland and England, and official documents that never before appeared. They may serve to raise the character of that country which it is now the fashion to depress, and rescue from oblivion the most glorious period of her annals, when her people were strong and generous, but, alas! too credulous and too confiding; they may teach the rising generation to revere the memory of those departed patriots who struggled so nobly for their liberties; may still cherish the virtues of her people; may generate a race of patriots; and thus convert them into a race of heroes." Dr. Nagle then moved a vote of thanks to Mr. Grattan for his donation, which was seconded by the Hon. Mr. Hutchinson, and passed with acclamation. Mr. M. O'Connell handed in 20*l.* from Waterford, 8*l.* 13*s.* 6*d.* from Glasgow, and then observed that he had to present the Association with a proof that the cause of Repeal was making considerable progress amongst their sturdy countrymen the Presbyterians of the north. The honourable gentleman then handed in several contributions from the north, including 29*l.* 10*s.* from Dungibbon, county Derry; and 6*l.* 16*s.* from Dungannon; and moved a vote of thanks to the subscribers. The Hon. Mr. Hutchinson, in seconding the motion, said that, from the information he had been able to obtain, he could fully bear out the observations of Mr. O'Connell with regard to the spread of Repeal principles in the north of Ireland. Mr. Daunt moved the expulsion of two Repeal wardens at Airdrie, in Scotland, from the Association, as they acknowledged that they were Ribandmen; and spoke at some length against secret societies. It was false to say that the Repealers were, in their hearts, pleased with the spread of such societies. Mr. M. O'Connell, in seconding the motion, expressed his regret that Irishmen could be so stupid and insane as to listen to those traitors who led them into illegal and criminal bodies. In every instance, the heads and fomentors of those Riband societies were dissolute keepers of low shebeens and public-houses, who invented these foolish rules to give attraction to whisky-drinking. He drew a strong picture of the miseries of a convict life in Van Diemen's Land and Norfolk Island, as a warning

to those who might be disposed to join Riband lodges. Mr. Broderick and Mr. Hutchinson then made some remarks, after which the rent for the week was announced to be 391*l.* 6*s.*—We regret to state that Father Mathew is involved in pecuniary embarrassments, in consequence of his sacrifices in promoting the cause of temperance. The announcement of this circumstance has produced a deep feeling of sympathy in the public mind, and there is no doubt that a subscription will at once be set on foot, both in England and Ireland, for the purpose of relieving Mr. Mathew from his difficulties, and of showing at the same time the sense entertained by the public for his valuable services.

SCOTLAND.

Glasgow.—We noticed in our last the public dinner given to Professor Liebig by the inhabitants of this city, and gave his speech as reported by the *Glasgow Herald*. We learn from the same paper that a unanimous resolution having been come to by the Town Council on Thursday last to present the freedom of the city to Professor Liebig during his visit to Glasgow, the ceremony of conferring that honour on the distinguished stranger took place on the 12th in the Council Hall. In consequence of the Professor's stay being limited, it was not found convenient to assemble the Council for this purpose, and the matter was accordingly left in the hands of the Lord Provost and Magistrates. At the time specified the Lord Provost and Magistrates, with the mover and seconder of the motion in Council, met in the Council Hall, where Professor Liebig attended, accompanied by Dr. T. Thomson, Dr. Gregory, Dr. R. D. Thomson, Professor Hanstein, of Giessen; Mr. Gourlay, secretary to the committee for getting up the recent dinner, and a number of other friends, chiefly strangers. The Lord Provost then presented the freedom of the city to this distinguished chemist in the usual manner. Professor Liebig shortly returned thanks for the honour done him, and said that his gratitude for the kindness and attention shown him since he came to Scotland would never be forgotten. He felt proud of the honour which he had received in being created a citizen of Glasgow; and in his own country would never cease to retain a lively and grateful recollection of their kindness. We may also mention that on the night of Professor Liebig's arrival in Glasgow, several of his countrymen resident in the city proceeded to his residence (Professor Thomson's, St. Vincent-street), and greeted him from under the windows, in a serenade, composed in German, for the occasion. Immediately on the voices being heard, the windows were thrown open, and the Professor presented himself, attended by his host and the ladies of his family. When the serenade was concluded, he came to the door, and thanked his countrymen warmly for the compliment they had paid him, shaking them all cordially by the hand, and requesting to know each of their names; after which the party withdrew. The conversation was carried on, of course, in the German language.

Miscellaneous.

The English Lakes.—Mr. Wordsworth, the Poet-Laureat, has just published the following sonnet on the projected Kendal and Windermere Railway, which is intended to pass through some of the most beautiful scenery of the English Lakes:—

Is there no nook of English ground secure
From rash assault? Schemes of retirement sown
In youth, and mid the busy world kept pure
As when their earliest flowers of hope were blown,
Must perish: how can they this blight endure?
And must he too his old delights disown
Who scorns a false utilitarian lure
'Mid his paternal fields at random thrown?
Baffle the threat, bright scene, from Orrest-head
Given to the pausing traveller's rapturous glance!
Plead for thy peace, thou beautiful romance
Of nature; and if human hearts be dead,
Speak, passing winds, ye torrents, with your strong
And constant voice, protest against the wrong!

Rydal Mount, Oct. 12, 1844. WM. WORDSWORTH.

Let not the above be considered as merely a poetical effusion. The degree and kind of attachment which many of the yeomanry feel to their small inheritances can scarcely be overrated. Near the house of one of them stands a magnificent tree, which a neighbour of the owner advised him to fell for profit's sake. "Fell it!" exclaimed the yeoman, "I had rather fall on my knees and worship it." It happens, I believe, that the intended railway will pass through this little property, and I hope that an apology for the answer will not be thought necessary by any one who enters into the strength of the feeling.—*W. W.*

Law.

CENTRAL CRIMINAL COURT.—*The Hon. W. R. Tuchet*, aged 21, was charged upon a capital indictment with feloniously shooting at Mr. Thomas Smith, a gunmaker in Holborn, and wounding him in the back, with intent to kill and murder him. The particulars of this case are already familiar to our readers. Prisoner went to Mr. Smith's shooting gallery for the ostensible purpose of practising pistol-shooting, and shot Mr. Smith, who was loading the pistols for his use. On being taken into custody he said that he did it on purpose and wanted to be hung. The case was proved by several witnesses. Mr. Clarkson for the defence said, that no attempt would be made to contradict the facts upon which the charge was made against the prisoner, and that the defence of the prisoner would be founded upon the fact that at the time he committed the act he was not in such a state of mind as to be accountable for his actions. The unhappy young gentleman was the brother of the present Lord Audley, and the son of the late lord, and he could assure the Jury that the prisoner's family felt as deep regret for the injury that had been sustained by the prosecutor as he or his friends could feel upon the subject. Council then proceeded to call the attention of the Jury to the circumstances under which the act had been committed, and expressed his opinion that almost alone they showed the prisoner could not be aware of what he was doing, and that, in point of fact, the act he committed was that of a madman, not at all aware of the consequences of what he had done. He then proceeded to state the facts that were afterwards adduced in evidence, and concluded by adducing the testimony in support of his statement. Lord Audley, prisoner's brother, Dr. Monro, Dr. Warburton and other witnesses deposed to various circumstances proving the insanity of the prisoner, and Justice Maule having summed up, the Jury, after a short deliberation, returned a verdict of Not Guilty, on the ground of insanity. The prisoner was ordered to be detained during Her Majesty's pleasure. Counsel for the prosecution then applied for costs, amounting to 6*l.*, incurred by the attorney of Mr. Smith. It was at the same time stated that, owing to the transaction, and the hindrance occasioned by it to the business of Mr. Smith, he had become very much embarrassed, and would be obliged to take advantage of the relief afforded by the Insolvent Act, and this solely owing to the transaction in which he had so unfortunately been involved. The Court granted the application. *The Slave Trading Case.—Thomas Jennings*, late captain of the Augusta, was placed at the bar. The Judges having decided that his plea of *autrefois acquit* could not be admitted, there being no proof that he had been tried at Sierra Leone and acquitted, Mr. Payne as counsel for the prosecution, moved to have the trial postponed to a future session, on the ground that the evidence of Captain Hill, which was of the greatest importance, could not be obtained as yet, he being on duty on the coast of Africa. Prisoner's counsel complained of the great hardship to which he was subjected in having this indictment hanging over him for such an unreasonable length of time, and for the indefinite period to which it was now about to be extended. The indictment had been instituted last year, and although the first delay was occasioned by the prisoner, in order to obtain from Sierra Leone the necessary proofs on which to found his plea of *autrefois acquit*, yet it would appear now to be only fair that some time should be appointed for the trial to take place. The Court thought the application made on behalf of the Crown reasonable, and therefore the trial should stand over to the next sessions. The prisoner was then admitted to bail in the same amount as on the previous occasions.

SPORTING.

NEWMARKET SECOND OCTOBER MEETING.—FRIDAY.—*Post Match*, 200. Duke of Bedford's Panther, 8st 7lb, beat Lord Glasgow's c. by Velocipede, out of Amulet, 8st 11b, by a head.—*Handicap Sweeps* of 20 sovs each, for 3 yr olds and upwards; 7 subs. Lord G. Bentinck's Discord, aged, 9st, beat Lord Exeter's Dr. Hill, 3 yrs, 6st 4lb, in a canter by two lengths.—*Prendergast Stakes* of 50 sovs each, h. ft., for 2-yr olds; colts, 8st 7lb; fillies, 8st 5lb; 22 subs. Mr. Copeland's My Mary, sister to Our Nell, beat Mr. Payne's Sir Francis by Jerry, Colonel Peel's Hersay, the Duke of Rutland's c. by Royal Oak, out of Cowslip's dam, and Lord Albemarle's Scarmentado. Won easily by a length.—*Handicap Sweeps* of 15 sovs each, 10 ft., for 2 and 3 yr olds; 12 subs. Mr. H. T. Worley's Example, 3 yrs, 7st 9lb, beat Lord G. Bentinck's Great Mogul, 3 yrs, 7st 9lb, and 8 others which were not placed. Won by a neck, the Attorney third.—*Match*, 100. Duke of Bedford's Minotaur, 8st 8lb., beat Lord Exeter's Dr. Hill, 7st, by a length and half. Colonel Anson's Buzz, 7st 5lb, received from the Duke of Bedford's Espoir, 8st 7lb; 200 h. ft. Duke of Bedford's Oakley, 9st 11b, received from Mr. J. Day's St. Lawrence, 8st 8lb; 200 h. ft. Duke of Bedford's Glen Fishie, 8st, received from Mr. Phillimore's Physalis, 8st 7lb; 150 h. ft. Mr. Booth's New Year's Day, 7st 11lb, received from Colonel Peel's c. by Slane, out of Cobweb, 8st 7lb; 200 h. ft. Mr. Payne's Mania received from Lord Maidstone's The Caster, 50, 8st 7lb each.

BIRTHS.—On the 18th inst., the COUNTESS OF SANDWICH, of a son—In Old Burlington-street, the lady of G. WAITE, Esq., of a daughter—At Mannheim, on the Rhine, the lady of Capt. C. ANDREWS, of a son—18th inst., at Southampton, the lady of the Rev. W. POYNDER, of a son—18th inst., the lady of I. J. CLARKE, of 2, Harleyford-place, of a son—18th inst., at Gunton Park, Norfolk, the Hon. Mrs. SANDERSON, of a son—19th inst., at Brakfield House, New Lanark, the lady of C. WALKER, Esq., of a daughter—19th inst., at Albion Cottage, Downshire Hill, Hampstead, the lady of D. L. JONES, Esq., of a daughter—19th inst., at Islington, Mrs. J. TIBBS, of a son—20th inst., in Hereford-street, Mrs. NEWBERY, of a daughter—20th inst., at Spring Park, Addington, Surrey, Mrs. H. DAVIS, of a daughter—20th inst., at Norwood, Mrs B. FABIAN, of a daughter—21st inst., at Grosvenor Park, Camberwell, Mrs. N. HORNE, of a son—21st inst., Mrs. WOODS, Brixton-rise, Surrey, of a son—22d inst., at 18, Southampton-street, Bloomsbury-square, Mrs. W. L. DONALDSON, of a daughter.

MARRIAGES.—On the 15th inst., at Killarney, S. HUNTER CHRISTIE, Esq., Secretary to the Royal Society, Professor of Mathemetics in the Royal Military Academy, Woolwich-common, to MARGARET E. MAHONEY, daughter of the late J. Mahoney, Esq., of Killarney—17th inst., at St. Ann's Church, Belfast, R. L. OGILBY, Esq., Dungivan, county of Londonderry, to ELIZ. M. RAINEY, eldest daughter of the late Major Rainey, Mount Panther, county of Down—17th inst., at Rickmansworth, G. BATE, second son of R. Bate, Esq., of Henstead, Suffolk, to MARY SEDGWICK, eldest daughter of the late Mr. J. Sedgwick, of Woodwicks, Rickmansworth, Herts—19th inst., at the parish-church, of St. Marylebone, A. K. FORBES, Esq., barrister-at-law, and eldest son of A. Forbes, Esq., of Newstone, county of Meath, and of Craig-a-Vad, county of Down, to EUPHEMIA NICOL, eldest daughter of the late Colonel Nicol, Adjutant-General of the Bengal Army—17th inst., at Kencot, Oxfordshire, the Rev. A. NEATE, rector of Alvescot, in the same county, to ELEANOR BURNABY, eldest daughter of the late R. Burnaby, Esq., and niece of Sir William Burnaby, Bart.—23d inst., at All Saints, Maidstone, GEORGE J. LUCKIE, third son of D. Luckie, Esq., of Clapham-common, Surrey, to SARAH ANN WHITE, eldest daughter of T. White, Esq., of East Hall—24th inst., at St. Luke's Church, Chelsea, G. G. S. COWARD, eldest son of J. E. Coward, Esq., of Tiverton, Devon, to ANN NORTH, daughter of the late J. E. North, Esq., of Leicester.

DEATHS.—On the 7th inst., at Brighton, MARY W. LLOYD, eldest daughter of the late Capt. W. Lloyd, Royal Navy—10th inst., at Kenn, Devonshire, SARAH TYRRELL, widow of the late Mr. G. Tyrrell, Chancery-lane, and only daughter of Mr. Thomas Ryder, formerly of Holborn—16th inst., at Harrogate, EDWARD E. DEACON, Esq., of the Inner Temple, barrister-at-law, and of Michael's Grove, Brompton, aged 60—16th inst., at Brighton, EDITH R. CROSBY, the infant daughter of James Crosby, of Church-court, Old Jewry, solicitor—18th inst., at Torquay, CLARA J. THOMAS, second surviving daughter of the late Evan Thomas, Esq, of Llwynmadoc, of Brecknockshire, and formerly of Sully, Glamorganshire—19th inst., at her residence, St. Thomas's-square, Hackney, at a very advanced age, ANN WALLEY, relict of the late J. Walley, Esq.—19th inst., at Brighton, JANE ORR, the beloved and affectionate wife of W. Orr, Esq., of 21, Russell-place, Fitzroy-square, London—19th inst., at her residence in Harpur-street, Queen's-square, Mrs. KNIGHT, relict of the late L. Knight, Esq., formerly of the Island of Jamaica, and latterly of Southampton, aged 81.

H. WALKER'S NEEDLES (by Authority the "Queen's Own") have large eyes, easily threaded, even by blind persons, and improved points, temper, and finish. Each paper is labelled with a likeness of Her Majesty or His Royal Highness Prince Albert, in relief, on coloured grounds. Every quality of Needles, Fish-hooks, Hooks-and eyes, Steel Pens, &c., for shipping. These Needles or Pens for the home trade are sent free, by post, by any respectable dealer, on receipt of thirteen penny stamps for every shilling value.

H. WALKER, manufacturer to the Queen, No. 1 (late 20), Maiden-lane, Wood-street, London.

EXTERNAL DISEASES.

COD LIVER OIL.—Read the following Undeniable Testimony of the extraordinary value of this natural remedy in the CURE of GOUT, RHEUMATISM, SCROFULA, DISEASED JOINTS, SPINAL and GLANDULAR AFFECTIONS, LUMBAGO, SCROFULOUS ULCERS, and other external Diseases:—

Sept., 1844. Mr. H. W. PITMAN, Moor's Picture Gallery, St. Martin's-lane, London, cured of excruciating Gout and Rheumatism, after having tried every other remedy.

Oct., 1844. ANNE MIDGLEY, 331, Strand, cured of a Diseased Swelling of the Legs, with only a small bottle of the Oil, after leaving St. Thomas's Hospital as incurable, and trying the advice of several medical men without the least benefit.

Sold in bottles, at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.* each, by SANGER, Oxford-street; HOOPER, Chemist, Pall-Mall; JOHNSTONE, Cornhill, and all respectable Medicine Venders in Town and Country.

CAUTION.—Observe the Seal and Address of JONES & Co., 201, STRAND, on the Wrapper.

WANTED, a young MAN, as GARDENER, who will have the care of a Saddle Horse, and be expected to make himself generally useful on the premises. He will board and lodge in the house. None need apply whose character will not bear the strictest investigation.—Direct to Mr. J. PERRY, Shrublands, Chelmsford.

WANTED, a FARM BAILIFF, upon a Farm of 300 acres, near London. He must be a perfect master of his business, active and economical in his arrangements, acquainted with the present improved system of Arable and Flock Farming, about 35 or 40 years of age, and with the best testimonials of his being a thorough Farmer.—Apply to Mr. LAWRENCE, No. 18, Piccadilly.

WANTED, a MAN and his WIFE, without incumbrance, to look after a GARDEN and TWO HORSES. He must be a good Kitchen Gardener, and will have every assistance rendered him. His Wife must be a good plain Cook, to attend to Dairy, &c. As there is only a Master and Mistress to please, high wages will not be given; they will board and lodge in the house, and have 20*l.* wages.—Direct to W. B., Post-office, Luton, Beds.

WANTED, as HEAD-GARDENER, a respectable active person, who thoroughly understands his business, particularly the Fruit and Kitchen-Garden. A married Man (under 40), without incumbrance, would be preferred. Wages, 40*l.* a year and house. The place will be a quiet and comfortable one. None need apply who cannot produce unexceptionable references as to character and ability.—Address, post-paid, A. B., Post-office, Harpenden, St. Alban's.

WANT PLACES.—All Letters to be post-paid.

AS PROPAGATOR.—A married Man, aged 28, who has a practical knowledge of his business, and can give satisfactory references for character and ability.—Direct to A.P., Messrs. Whitley and Osborn, Nursery and Seedsmen, Fulham.

AS GARDENER.—A respectable married Man, without incumbrance, aged 33, of sober and industrious habits, who has a general knowledge of his profession. He has lived three years and a half in the situation he has just left, and his character will bear the strictest inquiry.—Direct to A. B., Mr. Glendinning, Chiswick Nursery, Turnham Green.

AS GARDENER.—A married Man, 41 years of age, who understands the management of the Kitchen and Flower Garden, Early Framing, Greenhouse, &c.; would not object to the care of a small quantity of land. Can be highly recommended for 18 years past.—Direct to A. B., Mr. Hoskins, Greengrocer, Westow Hill, Norwood, Surrey.

AS GARDENER, a married man, who is conversant with the thorough management of Hothouse, Greenhouse, Kitchen, Fruit, and Flower-garden, and the various branches which require experimental knowledge. His character will give satisfaction to this effect from the place he has just left.—Direct to A. Z., Post-Office, Fulham, Middlesex.

AS GARDENER.—A Gentleman, who has just left his country residence, is desirous of obtaining a Situation for his late Gardener, whom he can confidently recommend. He had the charge of 45 acres of Grass Land, with the Stock; understands the duties of both situations. His Wife is a competent Laundress, or can undertake the management of the Dairy. Satisfactory testimonials, and between three and four years' character will be given.—Direct to R. S., at Mr. Pelcher's, Hair-dresser, North End, Croydon, Surrey.

AS GARDENER.—A married Man, without family, aged 30, who is thoroughly acquainted with Forcing on the improved principles, and the various other Departments of his Profession. Can have an excellent character for ability, honesty, sobriety, and general good conduct, from the family he has just left, in consequence of his being married. Has no objection to any part of the United Kingdom.—Direct to WM. COOPER, care of Mr. Butcher, Nurseryman, Stratford-on-Avon, Warwick.

AS GARDENER.—An industrious steady married Man, aged 32, without incumbrance: he can undertake the entire management of Hot and Greenhouse, Forcing, and the Pleasure and Kitchen Garden departments; can have a year and a half unexceptionable character from the gentleman he is about leaving. Terms moderate.—Direct to A. B., at Mr. Cunwen's, Plaistow, Essex.

AS GARDENER.—A Single Man, native of Scotland, well acquainted with Gardening in all its branches, having gone through a course of experience in several of the principal places in Scotland, and who has held a responsible situation in the neighbourhood of London the last 3½ years, which he has just left. A Situation in the Country would be preferred.—Direct to A. K., at Mr. Halley's Nursery, Blackheath, Kent.

AS GARDENER.—A Single Man, aged 29, a native of Scotland, who understands his business, and can have six years' character from the gentleman he has just left.—Direct to M. D., Mr. Joby's, Whip's Cross, Walthamstow, Essex.

AS UNDER-GARDENER.—A steady, active young Man, who has been several years at his business, wishes to obtain a Situation as above, for further improvement. Can have a good character from his last situation.—Direct to A. B., Mr. Hodgson, Nurseryman, Brigg, Lincolnshire.

A YOUNG MAN is desirous of obtaining a Situation to attend to a NURSERY AND SEED SHOP. Respectable Reference and Security can be given. Direct to S.S. Office of this Paper.

TO SEEDSMEN, &c.

A RESPECTABLE YOUNG MAN wishes a Situation in a good House of Business. Salary moderate.—Direct to W. J. P., care of Mr. Clark, Seedsman, Bishopsgate-street, City.

KENSINGTON NURSERY.
UNDER THE ESPECIAL PATRONAGE OF HER MAJESTY THE QUEEN.

RICHARD FORREST AND Co., Successors to WILLIAM MALCOLM, have much pleasure in directing the public mind to their extensive and correctly-named Collection of FRUIT-TREES of every desirable kind introduced to the country. These grounds, so highly favoured for the growth of every description of Nursery Stock, and so long and so justly celebrated for its superiority, will well repay the visit of those who intend making a selection, for either autumn or spring planting, and their esteemed favours will meet with prompt and correct attention.

GAINES'S SPLENDID FIRST-RATE SEEDLING PELARGONIUM, "DUCHESS OF LEINSTER," which was considered by all the first growers the gem of the season, when it gained the Prize at Chiswick Fête, the only place at which it was exhibited; it is now on sale in strong plants at 3*l.* 3*s.* each. Also Gaines's "King of the Belgians," 3*l.* 3*s.*; Gaines's "Trafalgar," 3*l.* 3*s.*; Gaines's "Alice Hawthorn," 2*l.* 2*s.*; Gaines's "King of Saxony," 2*l.* 2*s.*; Gaines's "Sir Wm. Massey Stanley," 2*l.* 2*s.*; Gaines's "Marchioness of Lorn," 2*l.* 2*s.*; Gaines's "King of the French," 2*l.* 2*s.*, with many first-rate Seedlings raised by other cultivators. A priced Catalogue of Pelargoniums, Pansies, Calceolarias, Camellias, Cinerarias, Fuchsias, Verbenas, Chrysanthemums, Carnations, Picotees, Auriculas, &c., may be obtained of N. GAINES, Surrey-lane, Battersea.

P.S. The collection of Seedling Coreas raised by Mr. Milnner, are now in blossom, and may be seen at the above Nursery.

LYNE'S NEW GERANIUMS.

WILLIAM E. RENDLE can execute a few more orders for the following:

Lyne's	Princess Alice . .	each—21*s.*
,,	Redworth	21*s.*
,,	White Perfection . . .	21*s.*
,,	Confidence	21*s.*
,,	Imogene	21*s.*

Plants will be delivered after 12th November. "SAPPHO" cannot be sent out this season; no more orders can be received for "KING OF SAXONY."

LYNE'S "PRINCEPS," 10*s.* 6*d.* each.

*** The stock of the above is limited to about six plants of each; early orders are therefore necessary to insure a supply.
Union-road Nursery, Plymouth, Nov. 2, 1844.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment FLORIST TO HER MAJESTY, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4*s.* per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. COBBETT'S, late MR. BARRON'S, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocuses, Tulips, Anemones, &c. &c.; Price Catalogues of which may be had per Post.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

UNDER THE ESPECIAL PATRONAGE OF HER MOST GRACIOUS MAJESTY THE QUEEN DOWAGER, H.R.H. THE DUCHESS OF KENT, THE RIGHT HON. LORD COTTENHAM, THE EARL OF ORFORD, THE EARL OF RADNOR, AND THE HORTICULTURAL SOCIETY OF LONDON, &c. &c.

A Letter, of which the following is a copy, has been received from the Hon. Wm. Ashley, Treasurer to the Queen:—

SIR, PAVILION, February 2d, 1837.

I am commanded by the Queen to acknowledge the receipt of a basket of Tobolsk Rhubarb, sent by you for Her Majesty's acceptance, and to say that its excellent qualities fully justify the high character you had previously given it.

I remain, Sir, your obedient humble servant,
To Mr. WILLIAM YOUELL, (Signed) WILLIAM ASHLEY.
Horticultural Establishment, Yarmouth.

YOUELL'S TOBOLSK RHUBARB.—This highly-esteemed variety will be found to be the earliest of all early sorts, as well as the most hardy. As a proof of its extraordinary precocity, it has been ready for Tarts, &c., the 20th of February, on the open border, in a very exposed situation, and continued to produce its fine large stalks till September.

It would be useless to eulogise its merits further than the great demand for it, together with the many high testimonials of approbation received, claim for it a decided superiority.

The TOBOLSK RHUBARB may be grown in boxes or pots, in any common garden-mould, or enveloped in damp Moss, and placed in a closet, dark cellar, the back fire-room of a hothouse, or forced in the open border, under the same treatment as Sea-kale, and watered occasionally, where it will produce its stalks of a beautiful transparent delicate pink, containing a rich vinous juicy pulp, exempt from the medicinal flavour objectionable in other sorts; and when cooked, retains its beautiful colour, which renders it an elegant addition, as well as a delicious luxury, to the table, at a season when fruits are unattainable. Roots planted the latter part of November will be ready for cutting in January. A fresh box brought in every three weeks will afford a regular supply; and the plants, when done with, may be taken out of the boxes and replanted in the open ground, and may be again cut for use in the summer, and replaced in the cellar, &c. in November.

It will be observed, one of the prominent features in this variety is, that the most inexperienced person may cultivate it with certainty of success, by attending to the above directions.

Price of Strong Roots, fit for present forcing, 12*s.* per dozen.
Also, Myatt's Queen Victoria Rhubarb, 12*s.* per dozen.
YOUELL & Co., Great Yarmouth Nursery, Oct. 31, 1844.

THE NEW SUPERB SEEDLING PICOTEE,
"BURROUGHES'S DUKE OF NEWCASTLE."

YOUELL & CO. have much pleasure in announcing that they will send out for the first time the above splendid light-edged purple Picotee, raised by the Rev. J. Burroughes. It is guaranteed to surpass any Purple Picotee that has yet been raised. Without commenting further upon its superiority, Y. and Co. beg to refer to a report in a late No. of the *Gardeners' Chronicle*, as follows:—

"The *Duke of Newcastle* is a flower of first-rate properties; it is a light-edged purple; the petals are large, and of good form and substance; even on the edge; the colour unbroken; the pod good, and with less disposition to bar than is common." It obtained the first prize, as the best seedling, at the Norfolk and Norwich Horticultural Exhibition. Price 21*s.* per pair. The stock being limited, to prevent disappointment early orders are respectfully requested. Y. and Co. are also enabled to supply the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, and have been exhibited and obtained first-class prizes at several of the metropolitan Exhibitions of the present year. They are as follow:—

Burroughes's	Mrs. Benyon, Red Picotee .	7*s.* 6*d.*
,,	Lady Alice Peel, Rose Picotee .	7 6
,,	Miss Jane, Purple Picotee . .	7 6
,,	Mrs. Bevan, Red Picotee . .	7 6
,,	Enchantress, Scarlet Picotee .	5 0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and ready for sending out to any part of the United Kingdom and the Continent at the following prices:

		£	*s.*	*d.*
12 pairs	extra fine and very superior first-class Show Flowers	2	10	0
25	ditto ditto ditto	5	0	0
12	ditto ditto Show Flowers	1	10	0
25	ditto ditto ditto	3	0	0
12 pairs	of Extra fine Show Pinks . .	0	12	0
25	ditto ditto ditto	1	1	0

The selection being left to Y. and Co.
Great Yarmouth Nursery, Oct. 31.

S. GIRLING begs to refer the Readers of the *Gardeners' Chronicle* to his Advertisement of PETUNIAS, SEEDLING VERBENAS, DAHLIAS, &c., of the 12th October.
Danecroft Nursery, Stowmarket, Suffolk.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may now be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London.

ROSES, &c.

J. COLE begs respectfully to inform the Nobility, Ladies, and Gentry that his CATALOGUE of Roses, Geraniums, Fuchsias, Fruit-trees, Herbaceous Plants, &c. is now ready for delivery, and will be forwarded Gratis upon application.

J. C. begs to add that his Roses were never finer in growth than they are this season. Charges moderate.
Rugby Nursery, Warwickshire, Oct. 30, 1844.

TO THE LOVERS OF ROSES.
WOODLANDS NURSERY, MARESFIELD NEAR UCKFIELD, SUSSEX; AND AT PARIS.

WILLIAM WOOD AND SON have the honour of submitting to the notice of their Friends and Amateurs, the undernamed truly magnificent Gallica Rose; it has flowered here this season in great perfection, and blooms were forwarded to Dr. LINDLEY, whose opinion appeared in the *Gardeners' Chronicle*, page 464.

MARGARET MARY (Wood's).—"Your seedling, Gallica, is a handsome variety, fine in form, being compact and very double, outside petals finely cupped: in colour it is of a purple rose, of a peculiar and beautiful tinge; it is fragrant, and at its best when fully expanded."

Plants of the above are now ready for immediate delivery. Standard and Dwarf at 5*s.* each. The usual discount to the trade when not less than six plants are ordered at once.

W. W. and Son further beg leave to state that they have on hand a very extensive stock of Roses, at the following prices, when the selection is left entirely to them:—

	Per doz.	Per 100. £	*s.*	*d.*
Superior selected standard Roses . .	24*s.*			
Superb do. do. . .	30 or	10	0	0
Select dwarf budded do. . .	12 —	3	15	0
Superb do. do. . .	18 —	5	0	0
Superior dwarf Roses (on own roots) . .	9 —	2	10	0
Superb do. do. fine show varieties	12 —	3	15	0
Fine Climbing do.	9*s* and	12 —	2	10	0

Catalogues of Roses and Nursery Stock will be sent gratis on application.

N.B. Plants will be presented GRATIS, in order to compensate the expense of carriage. A remittance, or reference, will be required from unknown correspondents.

TO THE PLANTERS OF ENGLAND.—TRUE HIGHLAND PINE.

JAMES GRIGOR, NURSERYMAN, Norwich, begs to remind such of the Planters of England as are anxious to enhance the beauty and value of their estates, that he is now sending out plants of this recently introduced and very desirable timber-tree, at the undermentioned prices:—

Single plants, strong and well rooted . .	6*d.* each.
Strong plants, 20 inches high . . .	5*s.* per 100.
Do. 18 ,, . . .	30*s.* per 1000.
Smaller-sized plants . .	from 10*s.* to 20*s.* ,,

For introducing this tree Messrs. GRIGOR, of Elgin and Forres, were awarded several premiums by the Highland and Agricultural Society of Scotland, where it is rapidly superseding the common Pine. In its old age it assumes in a great measure the darksome grandeur of the Cedar of Lebanon, and is therefore invaluable for planting in masses throughout the more prominent parts of distant landscapes. Sir Walter Scott describes it as presenting much of "the bold and contorted figure of the Oak;" and the *Quarterly Review* recommends it as an acquisition to churchyards and cemeteries. It is highly esteemed for all economical purposes, on account of the hardness and durability of its wood.

N.B.—J. G. has for the present disposed of all his potted plants; but as the others have excellent roots, there is no risk in removing them. A supply in pots will be ready in the course of next month.

CEDRUS DEODARA, raised from seeds in the open ground, 10*s.* each. Araucaria imbricata, Pinus excelsa, &c. &c. on reasonable terms.

TO PEAR GROWERS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, CLARENDON NURSERY, ST. HELIER, JERSEY,
Begs leave to draw the attention of Pear-growers to his new PEAR, named "LANGELIER'S BEURRÉ" of first-rate merit; perfectly melting ripe in January; shape of Napoleon, but larger in size; standard, tree very vigorous; one of the best flavoured Pears known, otherwise it would not be recommended by R. L., as his motives for advertising it is not for the sake of publishing, but for the good of the public in general, to whom he is happy to have the opportunity of rendering himself useful; of which, "VON MON LEON LE CLERC" will be a sufficient guarantee, having proved itself as it was represented, and given universal satisfaction. The trees of this Superb New Beurré are small and limited in number, and the price will be 21*s.*; if 6 trees are ordered, 7 will be sent; no discount will be allowed to the trade, and to the trade only will 8 plants be sent for 6; the number is very limited. R. L. also takes this opportunity to state that to this day numbers of "Von Mon Leon Le Clerc" remain unpaid for, consequently none will be sent to unknown correspondents, except for ready cash, or post-office order.

As this is the season for planting, R. L. wishes to draw the attention of the public to his acknowledged and unrivalled Collection, of which a List may be had by pre-paid letter, and begs to state that nothing is sent from his Establishment except proved fruit, unless requested. R. L. also wishes to obtain attention to a small quantity of EVERGREEN OAKS, among which will be found a great variety; they are fine and healthy, 2 years old, about 18 inches to 2½ feet high, fit for planting or potting, price 20*s.* per 100. Also, fine KIDNEY POTATOES, superior in flavour and produce to the Ash-leaf; the sample, extra fine, 5*s.* 6*d.* for 3½lbs. weight, as not less than that quantity will be sent.

HARDY SHRUBS AND HERBACEOUS PLANTS, &c.

WILLIAM MAY, F.H.S., cultivating the above in large quantities, is enabled to offer them on the very moderate terms below named, to which he respectfully begs to call the attention of persons about to make new or add to old Plantations. He can recommend them as being showy, fine varieties, collected for display, and not for mere botanical curiosity. The plants are strong and healthy, and will be correctly named, viz. Hardy Shrubs, two each, 42*s.* per 100; if 500 taken at once, 100 or more sorts will be sent; the 500 for 10*l.* Hardy Herbaceous Plants, 100 sorts for 42*s.*, or 200 sorts for 80*s.*; the selection being left to W. M. Victoria late Red Currant, 10*s.* a dozen; Hollyhocks, fine double sorts, at 42*s.* per 100. (See Advertisement, *Gardeners' Chronicle*, Oct. 5.) Remittance or reference from unknown correspondents.
Hope Nursery, Bedale, Yorkshire, Nov. 1.

HYACINTHS, ANEMONES, &c. delivered free to any Railway or Packet Office in London.

ANEMONES.

40 distinct varieties, new large double, by name	12s.

N.B.—The best sorts of Early Peas and other Garden Seeds, of home growth, are just harvested.

The above described bulbs may be depended on as of first-rate quality, and may be had at the low prices annexed, delivered free in London from Messrs. SUTTON and Sons, Reading Nursery, Reading, Berks.

A SPLENDID NEW LATE PEACH.

MORTON'S "WALBERTON ADMIRABLE."—This splendid variety was raised at Walberton House, in Sussex, the seat of R. Prime, Esq. It is a Seedling from the Noblesse, which it much resembles, both in size and colour. It possesses all the fine qualities of its parent, but its great merit arises from its ripening full five weeks later. A specimen of its fruit was sent to Dr. LINDLEY in 1841, from whom were received the highest testimonials of approbation. The tree is a fine, free, and hardy grower; the fruit is full-sized, melting, and excellent-flavoured, rendering it a truly desirable variety, and one which no good garden ought to be without. Good one year's trained plants can be obtained of ALEXANDER WEBB, Nurseryman, Westergate, near Arundel, Sussex; at Messrs. HAY, ANDERSON, and SANGSTER'S, Newington Butts; and also at Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street, London, at 10s. 6d. each; a few strong plants at 15s. each. The usual allowance to the Trade when three or more are taken, and carriage paid to London. Remittance from unknown correspondents is required.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX; and at PARIS.

WILLIAM WOOD AND SON beg leave to offer their extensive Stock of CAMELLIAS, fine Stocky Plants, well furnished with Flower-buds, at the following prices, the selection of Sorts being left to themselves.

Good and Esteemed Varieties		30s. per dozen.
Superior Selected	do.	45s. ,,
Superb New	do.	60s. ,,

Also a Superb Collection of all the best and newest CINERARIAS, fine Bushy Plants, well adapted for flowering during the winter months.

Very fine Varieties	6s. per dozen.
Superior Selected do.	12s. ,,
Superb New do.	18s. ,,

Plants will be presented to compensate for carriage. Catalogues of the above; also Lists of W. W. and Son's Collection of FUCHSIAS, VERBENAS, Greenhouse and Herbaceous Plants, may be had *gratis* on application.

Woodlands Nursery, Nov. 2.

THE TRUE FASTOLFF RASPBERRY.

YOUELL AND CO. beg to announce they are again able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

THORNE, Shepton Mallet; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO and Co., 100, Upper Thames-street, London.

MYATT'S BRITISH QUEEN STRAWBERRY.—A few Thousand of these are for Sale, at 3s. per hundred. Inquire of Mr. W. RAINS, either at Covent Garden or Hungerford Market.

H. CORSTEN, FLORIST to HER MAJESTY and HIS ROYAL HIGHNESS PRINCE ALBERT, 19A, Davies-street, Berkeley-square—has for sale Boxes containing 24 of the best Hyacinths, for water or pots, named sorts; 24 Tulips, in 4 sorts; 12 Narcissus, in 3 sorts; 25 Double Anemones; 25 Double Ranunculus; 12 new Iris Angelica; 12 Double Jonquils, true; 12 Gladiolus; 50 Crocus, in all colours; 50 Double Snowdrop.—2l. each box; half for 1l. Remittance required. H. C. warrants the roots to bloom most beautifully.

NEW SEEDLING PANSY—"FRYER'S STANDARD."

JOSEPH FRYER begs to inform the growers of PANSIES that he is again able to supply strong healthy Plants of the above, free by Post at 5s. each, with trade allowance when 3 are taken. For description, see Advertisement in the *Chronicle* of 10th of August. J. F. likewise begs to inform his friends that his extensive collection of PANSIES are at this time particularly fine and healthy. Catalogues of which, including Florists' Flowers, Greenhouse and Herbaceous Plants, &c, &c., are now ready, and will be forwarded on application.—Clarendon Nursery, Camberwell, Nov. 1.

"GENERAL TOM THUMB" SCARLET PELARGONIUM.

PHILIP CONWAY, NURSERYMAN & FLORIST, &c., Old Brompton, through the kindness of Mr. Ayres, is enabled to let out a few plants of the above, which is thus described in the *Gardeners' Chronicle*, page 560:—

"Unquestionably the finest Dwarf Pelargonium out is that which has this season been exhibited under the name of 'General Tom Thumb.' It grows almost prostrate, is exceedingly rich and dense in foliage, and produces with the greatest profusion large trusses of the most dazzling scarlet flowers imaginable. I have a plant at this moment nine inches high and six feet in circumference, studded with 27 trusses of expanded bloom, and some of the trusses six inches in diameter; and on five plants there are upwards of 120 trusses of flowers."

For both pot cultivation and bedding out this plant is unequalled. Plants 3s. 6d. each, or 36s. per dozen, with the usual discount to the trade if six are taken at one time. N.B.—At the June Exhibition of the Regent's-park Society a prize was awarded to the above; also to the following desirable variety of scarlets, viz.:—

Frost's Superb, a splendid pot plant	2s. 6d.
Mrs. Mayler, a very superior variety	2 6
Cooperii dwarf, for bedding	1 6
Huntsman, do.	1 6
Shrubland	1 to 21s.
Compactum	1 6
King	1 6
Queen	1 6
Conway's Giant Cactus, strong plants.	3 6 to 10s. 6d.
Veronica speciosa	3 6
Pelargonium Lanei, for forcing	1 0 to 3s. 6d.

Cash, with an order, is respectfully requested from unknown correspondents.

GENUINE DUTCH FLOWER BULBS.

J. CARTER, SEEDSMAN and FLORIST, 238, High Holborn, London, begs leave to remind his customers that the present is the best season for planting bulbs in the open borders, as also for placing Hyacinths, &c. on glasses, or in pots. The following is an extract from his Catalogue:—

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

CHAPMAN'S KIDNEY POTATO.—Messrs. C. and T. CHAPMAN, of Brentford End, are ready to execute orders for their POTATO at 10s. per bushel; any person desirous of seeing the quality and the yield can do so by applying to Mr. T. CHAPMAN, Sion Hill, Brentford End, when instructions for their preservation and culture will be given.—Nov. 2,

ELIGIBLE ESTABLISHMENT IN BUSINESS, IN KELSO, ROXBURGHSHIRE.

MR. LOCKIE, SEEDSMAN, finding it expedient, from his other occupations, to relinquish the Wholesale and Retail Seed Trade, &c., conducted by his late father and himself for upwards of 57 years, is ready to dispose of the BUSINESS and STOCK in TRADE; as also to let the Shop and House in the Market-place, and Granary in the Horse Market, to any party wishing to obtain so eligible an opening.

Mr. Lockie will continue the business as usual until an arrangement is made; but the party intending to succeed to it may have immediate entry to the whole premises.—Apply to Mr. GEORGE MAIN, Writer, Kelso.—Oct. 29.

EDWARD BECK informs the Public that in consequence of the greatly increased demand for his SLATE TUBS, he is enabled to reduce the price of the following sizes about 10 per cent. He regrets the too frequent delay which has occurred in the execution of orders. This he hopes to avoid in future by keeping a supply on hand. Their suitability to the growth of every description of plant is fully established, and their imperishability and consequent economy is beyond dispute.

The following plants have been exhibited by E. BECK in slate: Orchidaceæ, Heaths, Pelargoniums, Calceolarias, Stove-plants, Epacris, Fuchsias, and Roses. The prizes obtained by him last season at the Horticultural and Botanical Society's Exhibitions, were, 7 Gold medals; 3 Silver-gilt; 9 Silver; 4 Certificates of Merit. Prices for Cash or Post-office order:—14 in., 11s. each; 15 in., 12s. 6d.; 16 in., 16s.; 18 in., 19s.; 20 in., 22s. 6d.; 22 in., 25s.; 24 in., 32s.—Slate Works, Isleworth, Middlesex.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 10½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford Street.—Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton.

ST. ALBAN'S, HERTS.

UNRESERVED SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the Mortgagee (in consequence of the Estate having been disposed of), to submit to public competition, on the premises, the Key Field Nursery, St. Alban's, on Monday, Nov. 18th, 1844, and following days, at 11 o'clock, the whole of the varied NURSERY STOCK, comprising Fruit and Forest-trees, Evergreens, Ornamental, Deciduous, and American Plants of every variety, and about 3000 Standard and Dwarf Roses, consisting of the choicest varieties; 1,000,000 Quick and Oaks, of different ages; Seedling Beech, Ash, &c., Sea Kale, Asparagus, and Rhubarb, Dahlias, and Herbaceous Plants. The lots will be arranged to suit large and small purchasers. May be viewed one week prior to the Sale. Catalogues 6d. each, returnable to purchasers, may be had on the premises, of A. A. DORANT, Auctioneer and Land Surveyor, St. Alban's; of the principal Seedsmen in London, and of the Auctioneers, Leytonstone, Essex.

BROMPTON-PARK NURSERY AND SEED ESTABLISHMENT.—ESTABLISHED 1681.

MESSRS. GRAY, ADAMS, AND HOGG have much pleasure in directing the attention of their numerous customers to their extensive NURSERY STOCK, consisting of Dwarf and Standard Maiden and Trained Fruit-trees, Figs, Vines, &c. &c., all of which are this season of a very superior description, and will fully maintain the reputation this establishment has for such a long period of years enjoyed for producing these articles. The peculiar nature of the soil renders the removal of all ornamental trees and shrubs almost certain, of which there is a select and extensive collection; together with everything that is desirable in the class of Greenhouse and Herbaceous Plants.

MARKET GARDENERS are invited to inspect a fine stock of Half Standard Apples, Pears, and Plums, which they will find well worthy their attention.

The SEEDS of this season that have come to hand are generally of a very fine quality, and of which Catalogues will be issued in due course.—Kensington-road, Nov., 1844.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

LAVENDER-HILL NURSERY, WANDSWORTH-ROAD, NEAR LONDON.

During the present month, will be sold by Auction, unless previously disposed of by private contract, the valuable and healthy NURSERY STOCK of the late Mr. W. PAMPLIN, by order of the Executors, consisting of about Nine Acres of general NURSERY STOCK, particularly abounding in the Finest HARDY EVERGREENS, of all sizes; FRUIT-TREES, SHRUBS, and PLANTS; Large and Small CAMELLIAS, an extensive Collection of FERNS (some of extreme rarity); Erection of Greenhouse, Garden Frames, and Lights; Garden Implements, Shop Fixtures, quantity of Vegetable and Flower Seeds of the present Harvest, including a half-cwt. of best White Spanish Onion, Early Cauliflower, &c. &c.

Due notice of particulars will be given in a future advertisement. Meanwhile, parties contemplating purchasing the Leases of the Premises will be treated with at once, and may learn full particulars, and may inspect the Leases, on applying to Mr. W. J. LOAT, Clapham Common; or to Mr. W. PAMPLIN, Bookseller, 45, Frith-street, Soho.

LAVENDER-HILL NURSERY, WANDSWORTH-ROAD.—IMPORTANT LEASEHOLD PROPERTY to be Disposed of, by order of the Executors of the late Mr. W. PAMPLIN, Nurseryman. These valuable Premises with extensive frontage, most beautifully and eligibly situated, and capable of much improvement, consist of the substantial DWELLING-HOUSE, in capital repair,—dining, drawing, and large sitting-rooms, five good bed-rooms, and large underground and other domestic offices; Stable, Lofts, Sheds, and other buildings; about NINE ACRES of LAND, occupied as Nursery Ground. The whole (well adapted for a moderate family, for a Nursery and Seedsman, or for scientific and experimental Agricultural purposes) will be sold by public Auction during the present month, unless previously disposed of by private Contract

For particulars apply to Mr. W. J. LOAT, Clapham Common, or to Mr. W. PAMPLIN, Bookseller, 45, Frith-street, Soho.

HANTS.

TO BE LET, with immediate possession, a most desirable TITHE-FREE FARM, containing about Six Hundred statute Acres of Arable and Pasture Land, surrounded with good Markets. Also, a good WATER CORN MILL, adjoining the above Farm.

For particulars apply to WILLIAM PADWICK, Esq., Manor House, Hayling, Havant, Hants.

ATALOGUE of ROSES, FRUITS, TREES and SHRUBS.
RIVERS, of the Nurseries, Sawbridgeworth, Herts, has the following Catalogues now ready for delivery on ip' of postage stamps as follows:—
atalogue of Roses, No. 1, Edition for 1844 . . . 2d.
plement to ditto, containing the new varieties of Roses, with lists of Roses in extra-sized pots, for Exhibition, Forcing, and Greenhouse Culture . . 2d.
atalog' e of Roses, No. 2, containing the old and esteemed varieties, and Climbing Roses . . . 2d.
Descriptive Catalogue of Fruits . . . . . 2d.
Descriptive Catalogue of Trees and Shrubs . . . 2d.
Descriptive Catalogue of Pears, with directions for root pruning, three engravings of Pear-trees, trained conically and en quenouille; with supplement to Catalogue of Fruits . . . . . 1s.
The latter is sold also by Messrs. LONGMAN and Co., and . KERNAN, 4, Great Russell-street, Covent-garden.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 2, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

TUESDAY,	Nov. 5	Horticultural	2 P.M.
		Linnean	8 P.M.
SATURDAY,	Nov. 9	Royal Botanic	4 P.M.
WEDNESDAY,	Nov. 13	Microscopical	8 P.M.

Now that the POTATO-CROP is gathered in, and the sult known of any experiments that have been ade upon its growth, we shall be obliged to our ends for such data upon the subject as their experice may furnish. The subject is too important to be nsigned silently to the ordinary columns of correspndence, and we are anxious to have the opportuty of making some editorial observations introducry to the experiments. As soon as time has been ven for the communication of the returns we licit, the matter shall be taken up and disposed of.

A FORTNIGHT since we described the French ethod of forming TULIP-BEDS: we now continue e translation by giving their system of planting em, their diseases, &c.

"From the 10th to the 25th of November, (supsing the beds to be properly prepared,) is the best ne to put the bulbs in the earth. This is accomshed by stretching strings from one end of the bed the other, causing them to make slight depressions, us forming five longitudinal lines at equal distances the surface. The most expeditious way of crossing se with transverse lines is to take a piece of wood, exact width of the bed, pressing it down lightly the soil as often as required at the distance of nches apart.

"The section of these lines indicates the exact int where the bulb ought to be planted. At each these points a hole is made with a trowel, about an ch and a half in depth, into which is poured about wine-glassful of very fine sand, on which the bulb placed. It is then covered with a similar quantity; is permits the wet to filter through it, and is a preative against too much moisture. Each bulb is en gently pressed down, and covered with a little llock of earth. It has been clearly demonstrated various experiments, that the plan of many people, o make the holes for the bulbs with their fingers with a planting-stick, is altogether preposterous d absurd: by the pressure, the soil is rendered uch more compact, and less suitable for the proper velopment of fibres, as well as preventing a proper ainage."

The above coincides very much with our own actice; and to the latter assertion of the impropiety as well as impolicy of using a blunt settingck, we can, from experience, add our own testiony, as we well recollect a bed of Tulips being arly ruined by planting the roots in stiff loam when ther wet; the holes were made with a blunt dibber, d the bulbs placed carelessly in them. We saw bulbs removed, and discovered that the bottom the holes, as well as the sides, had been so comssed, that they actually retained the rain-water ich fell on the bed, and in most instances, the ts, unable to penetrate, had turned upward by the e of the bulb in search of nutriment.

Our Author then proceeds with the necessary ections for covering the bulbs, "which ought to with fine loam, of an equal thickness, of about r inches; the earth round the bed is then gently ed off, and beaten hard, so as to render it as d as possible, and afterwards covered with a thin er of a sort of mortar made of peat-soil, Grass ds, and water, well beat up together. Peat-earth referable for this purpose, as it is not so liable to ck as loamy soil in drying, and the Grass seeds enabled to vegetate more quickly in it, giving sistency to the edges of the bed, speedily forming autiful turf, and contributing to the beauty of whole. A stone curb or border has certainly ny advantages, affording no protection to snails noxious insects, as well as economising time in formation of the beds, but the cost is great."

We agree with the writer that the first outlay is siderable in having beds edged with stone or with which latter description of curbing we should prefer; still we think the expense would soon be saved in the labour, &c., which Grass borders must necessarily require to keep them neat and trim, independently of the cleanliness and durability of slate, &c. We find, however, that the system adopted by the most extensive Tulip-growers, of surrounding the bed with Oak or red deal planks, about 12 inches in depth, appears to give satisfaction; and when these are surmounted with a slight rail about 18 inches high, and the whole painted white (contrasting with the foliage, &c.), it has a very good effect. And as a preservative, and at the same time contributing to the *finish* of the Tulip bed, we would always recommend a neat latticework, about 4 feet high, fastened to the upright pillars of the shed, and completely surrounding it. The protection afforded by it is invaluable at that trying of all seasons. March, in breaking those fearful blasts which sweep over undefended beds with untiring energy, and often with serious consequences to the ensuing bloom.

"Exposed to sudden changes of weather, Tulips are liable to injuries which it is necessary to prevent. From the 15th of February to the 15th of April they are generally exposed to snow, frost, and heavy rain, at which time the leaves, just rising from the ground, form a kind of funnel, at the bottom of which is the flower-bud; these retain the water, which filters down, either destroying the root, or so far affecting it as to seriously injure the advancing bloom; the extent of the injury depending on the time more or less that the bud has been enveloped in water. Hailstones often cause great damage, wounding the petals, and defacing their beauty. Many other accidents to which Tulips are exposed might be enumerated, but the limits of this article would be too far extended, were I to enter into further details in this respect."

We are sorry that our Author does not enter more largely into the diseases, &c., with the precautions necessary to be observed, as great attention ought to be directed towards the Tulip. As soon as it makes its appearance above ground; those who would successfully exhibit will hoop their beds, and defend them from frost with mats; but a most excellent precaution, and one which we would strongly recommend, is to put fine sand on them, as soon as the plants appear above ground, and before the leaves have advanced so far as to separate, enveloping the rising plant in a complete cone; this is preferable to covering with soil, as it excludes frost better, does not retain wet so long, and is a preventive against canker.

Should the latter disease, however, attack the foliage, we immediately remove the soil below the affected part, and with a sharp knife cut it away altogether. Exposure to the air soon heals the wound, and the bulb is saved. We imagine that the most serious injury which the bloom sustains is when the hollow formed by the rising leaves gets filled with water (as noticed above), which, when it becomes frozen, imbeds the bud in a solid mass of ice, proving highly detrimental. To prevent this, the water must be removed, either by blowing it out, or drawing it up with a syringe. Should the buds escape injury in this manner, they must be carefully defended from hailstorms, which come on so suddenly as sometimes to preclude the chance of protecting them; small-meshed net, or damaged lace, spread over the hoops, will prove an efficient preventive.—*W.*

WE doubt not that a LETTER, in another column, from NEW ZEALAND, written by a gardener there to the late Mr. LOUDON, and received since that gentleman's death, will prove highly interesting to our readers, who have to thank Mrs. LOUDON for the kindness she has shown in allowing it to be made public. It is so difficult to judge correctly of the condition of a distant colony from the representations made by interested parties, that documents of this sort are invaluable. To us, the letter in question is the more acceptable, because it completely confirms all that we have constantly asserted regarding the climate and capabilities of that colony, which has nothing to dread except the mismanagement of the British Government.

ENTOMOLOGY.

AMMOPHILA SABULOSA (*the Grave-digging Sand-wasp*).—The economy of insects is so marvellous and interesting, that the introduction of the histories of those which may not be directly concerned in the destruction of our crops, needs, we hope, no apology; and as it is absolutely necessary that the gardener and farmer should be as well acquainted with their friends as with their enemies, we shall from time to time treat of the parasitic insects—most extraordinary agents which are employed by the Ruler of the Universe to subdue those plagues which without His interposition would despoil this fair earth of its beautiful vegetation, in spite of the best efforts of man.

I have therefore much pleasure in recording the history of a Sand-wasp, which labours incessantly and with incredible perseverance in the destruction of caterpillars and spiders, which it buries underground to support its offspring; and as one egg only is laid in each victim, and the Sand-wasps are very numerous, the amount destroyed by them must be very great.* About the 10th of June my friend Dr. Maclean pointed out to me a female Ammophila busily engaged in removing the earth from a hole in a south border, in order to bury a caterpillar, previous to laying an egg upon it. She kept entering the hole, vibrating her wings with apparent delight, which caused a distinct buzzing, like a large blue-bottle fly in a spider's web; every second she brought out a morsel of earth or a little pebble, which she threw down several inches from the hole, whilst on the wing; having at last excavated so far that we lost sight of her, we left the place, and found it so admirably closed the following day, that it would have been utterly impossible to discover the spot, if previous observations had not been made; two or three pebbles had been laid near the aperture, one of which, being flat and white, my friend very happily designated the gravestone, for upon digging we found a cell about two inches from the entrance, where a fat green larva, probably of some Noctua, was entombed; and on one side, close to a spiracle, upon the segment preceding the first pair of abdominal legs, was attached by one end a long elliptical egg, looking like a little fish's bladder, without any appearance of segments. In all probability it is not long before the trophi are developed, and the larva perforating the blackened end of the egg, the organs of manducation are inserted, like the seta of Scolia flavifrons, into the caterpillar, after which it rapidly increases in size, the extremity first dilating, the segments becoming visible in a few days, and in a week the spiracles, at which period it was about ⅗ of an inch long, cylindrical, shining, and of a whitish colour (fig. 2); the viscera were constantly in motion, undulating like yellow waves; the head was small, round, and armed with jaws and minute palpi; at this time scarcely anything but the skin of the caterpillar was left, with the exception of the anal legs, which remained of a green tint; but the animal was alive a few days before, and evacuated several pellets of dung after it was buried. The extremity of the maggot is conical, and I could not detect the slightest deposit from it. On the 19th every vestige of the caterpillar, not excepting the horny head, had disappeared; the head and thoracic segments of the maggot became attenuated, the sides exhibited a thickened margin, and a limpid drop exuded from the tail; it now began to spin an oval cocoon of the finest texture, shining, and resembling oil-case or gold-beater's skin, of an ochreous colour, and having a few loose woolly hairs on the outside, adhering to the surrounding particles of earth; within this was a narrower detached case forming the pupa, of a substance resembling the inner bark of a fir-tree, and not unlike it in colour; it was wrinkled longitudinally, but very smooth inside, appearing varnished, and of a rust colour, the exuvia lying at the lower extremity, which was pitchy externally.

On the 30th of July, a *female* Sand-wasp issued from the case, and it proved to be the Ammophila sabulosa of Linnæus (fig. 1). It is dull black, clothed with soft brownish hairs; head and thorax covered with shallow punctures; the former is large and furnished with long, powerful jaws, the maxillæ and labium forming a beak, with four slender palpi:† the eyes are large and lateral, the ocelli placed in triangle on the crown; the antennæ are rather short, curved at the apex, and 12-jointed; the trunk is oval; the scutel and metathorax are finely striated; the extremity of the latter and a spot on each side of the medipectus are of a yellowish satiny hue; abdomen long and clavate, forming a very long, slender pedicel at the base, and a stout oval mass at the extremity; the second joint of the petiole is red, except at the base; the following segment and the basal margin of the fourth are of the same colour; the four wings have a smoky tinge, forming a border at their extremities, and the third submarginal cell is not peduncled; the legs are powerful, the four hinder elongated; the tarsi are spiny, especially the anterior. It is 10 lines long and 12 in expanse. The *male* is much smaller, has 13-jointed antennæ; the face is silvery; the third abdominal segment has an elongated black spot on the disc, and the tarsi are much less spiny than in the female.

I wished to have entered upon a comparison of our larva with that of Scolia flavifrons, of similar habits, and so ably illustrated by Professor Passerini; but I can only observe that the Scolia egg is laid upon the larva of Oryctes nasicornis, and that the head of the maggot is furnished with a long seta. The curiosity of the reader may be gratified by a reference to the two Memoirs lately published at Florence.—*Ruricola.*

---

* Vide Curtis's Brit. Ent. fol. 604, for a similar account.

† Vide Curtis's Brit. Ent., pl. 604.

THE ROSE-GARDEN.—No. XX.

(*Continued from p.* 684.)

The choice of scions is regulated by the same rules as the choice of buds, only that in choosing scions some reference must also be had to the wood, which should have a sufficient thickness to keep it from getting dry easily, and to facilitate the operation of sloping the edges. The best buds are generally nearer the base of the shoot than the summit, but two or three scions may sometimes be obtained from a single shoot. No scion should be used when the buds upon it appear to have shrunk and lost their fulness from having been laid by, and care should be taken, on passing the bast ligament round the stock for the purpose of fixing the scions, that a piece of the bast be brought between the scions in such a manner as to protect the cleft in the centre of the stock from the clay, and to leave the vacuum to be filled up with sap.

V

Should any graft fail, which will be seen in a longer or shorter space of time, according to the weather (viz. in moist, dull, growing weather it will soon show, in that which is dry, windy, or cold there will be delay), the resource is still left of knocking off the clay and reserving for use the fresh buds which start from the stock; in which case the stock should be cut off immediately above them, and budded in the following autumn as usual. Grafting the Rose, however, leaves a worse wound to heal over than budding, unless the scion be nearly the same size as the stock, or two or three scions of free-growing sorts be entered in the same graft; there are also these disadvantages, that the portion of the scion which is entered in the stock is smooth, and consequently does not from time to time furnish new wood (whereas in budded stocks shoots occasionally spring from the inserted eye, and that sometimes years after it has taken, thus renewing the tree by preventing it from straggling, as well as giving it a more perfect and handsome appearance), and also that grafted Roses, without great care, are liable to lose their heads occasionally in very exposed situations; hence it is desirable to leave a long tongue to the scion that it may take a strong hold of the stock, and to take care that all parts of the wound are well covered over, in order to let the sap insert itself in the cleft, and with the temporary assistance of the ligature, fix the scion firmly in its place. After the first year, Roses budded with a dormant eye should be quite safe from the effects of the wind: grafted ones cannot be considered to be so.

The advantages of grafting are that it clears the garden of wild growing stocks, promises fair for instant success, especially when the scions are from hardy sorts, such as the Du Roi, Maiden's Blush, &c. and the work is complete, and tree formed, and in some cases flowers, in a single season. In the event of neglect in procuring stocks, the operation of grafting may be performed equally well with budding upon plants in a neighbouring hedge, and those which succeed can be transferred to the garden at leisure.

Home Correspondence.

The Polmaise Heating.—Your correspondent, Mr. Glendinning, appears to have profited a little from my last communication, for in his letter of the 26th October there is no mention of "dirty smoky flues or any modification of them;" yet he finds something wrong about "heated air," and "cold air," or anything else to find fault with; and after all, he appears to be as much in the dark as ever respecting the mode in which the Vinery at Polmaise is heated; but there is a proverb we have in Scotland that says—"There are nane sae blind as those that winna see." Only look at the predictions of Mr. G. The notions he has formed respecting the Polmaise system made him exclaim that "such an arrangement would be fatal to any system;" but what has the decree of fate been in regard to the Grapes at Polmaise? Bunches of Black Hamburgh weighing 5½ lbs., with a flavour declared to be excellent at the Edinburgh Horticultural dinner. Can Mr. Glendinning do better with any other system? If he can, the Vine-growing Bacchus would take him for an apprentice any day. "Why," says Mr. G., "anybody can do that without any heating apparatus at all." Indeed! I did not before know that it was so easy to produce clusters of Grapes weighing 5½ lbs. "without any heating apparatus at all," in the latitude of Stirling Castle.—*Peter Mackenzie.* [We have been obliged to omit some part of this communication, for the discussion is becoming personal and unprofitable. We have stated what the Polmaise system is, and what the results have been. Correspondents have given their opinions upon the subject, and have placed lookers-on in a condition to form their own conclusions. Until new evidence arises, or arguments take a new direction, it will be better to let the subject drop. Our own opinion is not unfavourable to the Polmaise apparatus—or rather contrivance—for apparatus there is hardly any].

Whitney's Composition.—This has been to me a very expensive failure. All my frames, made purposely for its application, are quite useless. A piece of the calico in its undressed state, which has been wet and dry, and lying about, is perfectly tough and sound: that upon the frames is as rotten as tinder—in fact, a mass of rags. I am not inclined to call it an imposition. All enthusiasts (and I hear Mr. W. is one in horticulture) are liable to arrive at too hasty conclusions, and in obtaining something desirable, to forget the other somethings that must be combined with it. Dipping in the sea was once considered an infallible cure for the bite of a mad dog: and so it was—if the patient was drowned. So Mr. Whitney's fluid makes the calico impervious to wet, provided you give it enough to destroy its texture.—*E.N.B.*

Tree-pruning.—Avoiding personalities, and leaving Dr. T. and Mr. B. to fight out their own battle, I would say a few words on the tree-pruning system. Boughs left altogether will shorten the stem, and so spoil timber. Cut off clean at once, they make a large wound, and are long in being healed over, by reason that the part of the stem whence the bough issued stands out to support it. Shortened according to the size and health of each patient, they grow at their bole or base but little, if at all, till the weight of the new foliage, again acting at a long arm, calls for more support. If we now, or after another pruning back, cut clean away, the tree has been making great advance above, and scarce feels the loss of the bough; the stem has grown upon and nipped up the bole of the branch, as may be illustrated by drawing up the forefinger and thumb of one hand (first placed in the contrary direction round the bole of the other thumb) towards the nail; the wound is now both less and sooner healed. Indeed we have been following Nature, who thus nips up and at last throws clean out the stump of a bough which has done growing and is dead; and this process has been performed by Nature upon every timber tree that ever grew. The bough thus left on some years longer adds to the strength and vigour of the roots and system, and returns, no doubt, some elaborated sap to the stem. Healthy subjects, as Mr. Punch wittily says of himself and the Whigs, "are for small change," and grow best with a regular but trifling excitement; unhealthy ones require stronger measures; but to shorten or cut away much foliage at one time from a healthy tree, prevents the due growth of the stem, and brings on disease.—*G. U.*——I see by the *Chronicle* that the controversy respecting the Nerquis plantation is going on still, and that Mr. Billington—if I understand rightly—has made "Quercus" a convert to his views. I am glad that the latter rejects the physiological question, and I think he is quite right. The question appears to me to be simply this:—After 40 years' evidence of plantations, as to their state of health and growth, is the system that has been pursued in 800 acres of mountain land that which others should pursue, or not? The statement made by Dr. Thackeray's planter and pruner, &c., who appears to be a plain matter-of-fact person, demands attention; and as plantations are connected with after-generations, and therefore should not be commenced without due consideration, I would suggest, that persons disposed to enter upon such operations (a *bonâ fide* national benefit), should proceed to Nerquis, and judge for themselves, before they commence planting. Allow me to suggest farther, that individuals visiting Nerquis, or sending others to do so for them, should ascertain these points as essentials to forming a correct judgment:—1st. Ascertain the elevation of the Nerquis mountains above the sea; 2d, the nature of the soil; and 3d, the original value of the land per acre on which these plantations have been planted, reared, and trained. Without these data, a right judgment cannot be formed on the subject. In addition to this, I would suggest that the quality of the timber itself be examined, as well as the extent of its growth in height and thickness, and the number of years it has taken in these mountains to arrive at its present state. This being done, ascertain where plantations can be visited, similarly circumstanced by position and age; and if these are found to be more improved than the plantations on the Nerquis mountains, endeavour to ascertain the system there pursued, and then determine on the course to be followed in a work, the profits of which must be more those of our grandchildren and great-grandchildren than our own. "Quercus" differs from Mr. Billington in this—that Dr. Thackeray's system is not Pontey's, but Pontey's outdone; and yet he says, in the line before, "I desire no better authority than that of Mr. Billington." Dr. Thackeray's planter, in his letter, mentions that visitors from various parts of England expressed their full confidence in the course that had adorned the Flintshire mountains with beautiful—and every year increasingly profitable—woods; and Dr. Thackeray himself invites all planters to come and judge for themselves; and I hope that in so important a matter as forming plantations, the invitation will be accepted by those who intend to plant. We are, I trust, in various parts of Ireland, in earnest in our hopes of improving our country, and employing our poor by covering its mountains with trees that shall on some future day be a national benefit.—*C. C. L. D., Wicklow Mountains.*——The subject of the pruning of timber-trees is one of so much importance, that, notwithstanding the numerous communications on that subject lately inserted in the *Chronicle*, I am induced to add one more short one to the number, more especially as I think the main point has been generally either overlooked, or not duly dwelt on by your correspondents. The true point for decision is, not simply what system of management will produce the greatest bulk of timber—but what system will produce the greatest bulk of serviceable shape, and freest from knots. Every one must be aware how much numerous knots impair the value of timber, but every one is not aware, or does not bear in mind, that each side-branch causes a knot, and that the only way to avoid numerous knots, is to get rid of numerous side-branches. Now there are two ways in which this may be done, viz., either by allowing trees to grow so thick together that most of the side branches perish for want of light, or by pruning them away. The first process, that which takes place in natural woods, but the result is, that the ends of the stumps, left where the side branches have dropped off, rot before the new wood has time to cover them over, so that wherever a side-branch has fallen off, there is found a ragged rotten end, large or smaller according to circumstances,* and if the boughs have been large, so that water can lodge in the hollow, the rottenness infallibly eats into the heart of the tree, and in time totally destroys the timber. When the second method, that of pruning, is adopted, and the side-branches are cut off clean and close to the bole of the tree, the new wood grows over the wound before the stump has time to rot, and sound timber is the result. The timber-merchant is, after all, the most proper judge to decide upon this point, and I think no timber-merchant, on seeing the annexed engravings, would hesitate in forming an opinion as to which represents the more valuable stick of timber. A represents the section of a fir-tree, where the side branches have been left on and have had room to grow to a considerable size. B represents one where the side-branches have been pruned off while young. A contains a greater bulk of timber, yet I presume it cannot be denied that such a stick as B is decidedly the more valuable of the two. C represents the appearance which timber assumes when grown in a close wood, so that the branches decay and drop off, containing numerous small knots more or less decayed at the ends.—*Beobachter.*

A. B. C.

Amateurs' Forcing-pit.—In hopes that some of your readers will take the matter up, I send my idea of the best forcing-pit for amateur gardeners of no great means, *i. e.*, a pit sufficiently warm, at the least expense and working. It would take too much room, I find, if I were to describe the common brick-flued pit, with a muck trench all round it; so I must suppose that some one who can throw any light on the question understand what pit I allude to, and will be able therefore to understand what alteration it is I would make in it in search of the best pit for an amateur. Having succeeded in producing a temperature at first too great, and afterwards sustained by a muck trench at top and bottom only, and having beat those around in Melons, although only filling in on three several occasions during the summer with fresh lining such holes as had been made in the linings used in the garden, I would now, if I were to build another pit—unless made wiser—make a muck trench at the back only, a little broader than usual; and on the other three sides—or, indeed, all round—build a dry air-flue, about 4½ inches wide, in the place of the muck trench. The steam or inner flue would, of course, be cut off from all communication with this latter, and run round the bed as before. I am not quite sure whether a good lining of Furze, placed all round the turf upon it, would not answer as well. My reason for this: far the greater part of the caloric of each, and therefore all the four narrow linings, is stolen by the cold wet soil around and below it, and the air above, rising into it with the steam; comparatively speaking, but little of it enters the bed to be consumed by the lost in passing through it. One broad trench requires half the muck of the four narrow ones, were it not that the bed would draw from only half the muck, would not longer than each, and therefore all, of the four narrow linings; for, by means of the non-conducting air-flue, half the caloric would be lost in the soil around; only half as much superficies being exposed to the below or the air above, only half as much caloric would be lost here. What I expect—and this is the point to be argued—is, that the temperature would be in the first stance as well and as long kept up by one broad trench as by four narrow ones. Now, suppose the temperature to fall together in the two cases, and an equal quantity of fresh lining to be added to each, the waste being only half as much in the proposed bed, and the consumption in the bed only the same, the new lining would last longer in it than the other; and I conceive that a cool bed

* Instances of these rotten knots may be seen in any common deal-floor made of foreign wood.

uld draw far more heat from the bed (that is, ultitely from the hot lining) than none at all would: t is, it would facilitate its escape into the cold soil ound the pit; and small gardeners will leave three cool ings, even when they put one fresh one. I must add w words about the position of a pit:—Muck must be own together twice for most garden purposes, and st be wheeled into the garden. Muck once thrown gether is fit for the pit, so that the mere supplying e hot muck to the pit entails no expense, where it is required for the garden, and has not to be wheeled t again; but where there is a farm-yard, I would ild the pit about 4 or 5 feet from the wall on the south le of it; and for the brickwork by the wall have a pair large doors folding inwards, opposite the middle of the t or pits. The common farm-labourer would through e gateway throw the muck at once to heat against the it, and when it cooled, would give it its regular turning heat again. On again cooling, the muck-carts would, rough the opening, cart away the old muck, or part of , for Grass, Turnips, Wheat, as the case might be, and esh be thrown up as before. If thought necessary, o pits could be placed side by side, with an additional nch between them; there would be no expense at all re, and only the slight inconvenience of carting a few ads for Turnips from a distance instead of from a heap n the field, at a time when horse labour is in demand. Even this would not be the case when mucking Grass or or Wheat; also, it is clear that any gentleman having a ouple of horses, or even one, might work a pit close to is stable in the same way, although not quite so free om trouble—that is, expense.—*G. U.*

Cabul Melons.—If Messrs. White and Co. had read ttentively my remarks at p. 684, on Mr. Cuthill's advertisement, they would have seen that it was the Cabul Melon which I denied having distributed seeds of. I ertainly had no intention of saying I had not supplied Messrs. White and Co. with the seeds of the Hoosainee 1843. As many people seem to confound the above wo Melons, perhaps a short explanation here may be of se. The Hoosainee Melon, of which Messrs. White nd Co. had seeds (or, as Mr. Cuthill would call it, the rentham Hoosainee), was raised here from the striped Hoosainee impregnated with the Ispahan. It is a large Melon, a free bearer, exquisite in flavour, and I beeve inferior to scarcely any Melon in cultivation; and feel not a little proud of its having been raised here. he Cabul Melon is one of recent introduction. The eeds were brought to England by the officers engaged in he Affghan war. It was first grown in this country, I elieve, in 1843. With regard to its properties, it tains about the same size as the Hoosainee, is a very e grower, and bears abundantly. It is a handsome ickly netted Melon, with a very sweet melting flesh.—. *Fleming, Trentham Hall.*

Strawberry-plants.—In the Calendar, p. 703, under he head Pineries and Vineries, directions are given for otecting from rain during the winter Strawberry-plants pots or boxes, intended for forcing. "G. F." seems think that rain is detrimental to the plants in pots. nder some circumstances I do not doubt its evil effects; t plants that have been properly prepared, and own as they ought to have been previous to the arrival the rains of autumn, require no such injurious treatent as boarding them in, which dries both leaves and ots. The best system that ever came under my obsertion, and which is adopted in many places where large antities are forced, and that to the greatest perfection, to keep them, from the time of being finally potted, nged down to the rims of the pots in beds of sand—a uth aspect is preferable; and where the ground will low, the beds should have a fall of eighteen inches or o feet, but this must be regulated according to the gth of the beds. By this method I have seen thousands plants kept through the winter in fine health, and not lf a dozen pots or plants damaged, either by rain or ost. If fine Strawberries are wanted, the potting off e plants should be completed early in August, so that e pots may be filled with roots before winter, as on at the success of forcing solely depends.—*Memet.*

Strawberries.—I herewith send you a sketch (full e), of a Keen's Seedling Strawberry, that was ked this morning with some others in an open bed in father's garden in this town. Its being of an unal size, viz. 7½ inches in circumference, and 1¼ oz. in ght, of a handsome heart-shape, full coloured and oured, has induced me to thus notice it. I also beg emark, that myself and a younger brother have had the ire management of the garden for some 10 or 12 years , and we have succeeded in obtaining finer crops of wberries than most of our neighbours, which I attriprincipally to not cutting off the leaves in the er.—*J. W., Asbridge, near Wells, Somerset.* [The ing represented a very fine specimen.]

Gardening in Italy.—A friend who is on a tour in north of Italy writes to me that since his last visit, e years since, he has found considerable improvein the care taken by Italians of their gardens, in construction of plant-houses, and especially in the y of the specimens cultivated. The great gardens e Borromean Islands, of Moriza, and of Padua, are better kept and richer in species. The gardener e Borromean Islands has succeeded in ripening the of the Hydrangea hortensis by artificial impregna, and by carefully cutting away all the large sterile rs. The 9th vol. of De Candolle's "Prodromus" ost ready, and the printing the 10th is to com in January.—*

Pelargoniums.—The nurserymen's catalogues are now with abundance of flowers at a guinea and guineas apiece. The descriptions abound as usual with splendid, matchless, indispensable, novel, magnificent, and words of similar import without end. Amateurs believed it all once, and with reason, for every season's advance was a stride. But now we wait a bit to see them in their true colours, and if we neither find them in letter A at Chiswick, nor in the seedling tent among the two-years-old, we shall put them down as good for nothing—unfit to exhibit—in fact, all that our note-books remind us too many of them are. Let nurserymen, therefore, do what they ought; respond to the liberality of the Society offering such liberal prizes, and serve the public and themselves by exhibiting the objects of their advertising praises at the Shows of the ensuing season. There is abundance of time, and nothing but want of merit can excuse their absence.—*A Purchaser.*

Morphology.—It is not a little amusing to notice the very awkward predicament in which a person places himself, by speaking in disparagement of a theory merely for the purpose of insulting those who have propounded it; but when we find that such an individual knows nothing about the theory itself, and is determined to learn nothing respecting it, then his remarks are too ridiculous to be either amusing or insulting to any excepting those who are as ignorant as himself. A striking exemplification of this came under my observation at the last meeting of the Regent's Park Gardeners' Society, in a discussion on Morphology. After much had been said, and several specimens exhibited in support of the claims of that science to the regard of horticulturists, and nothing intelligible proved against it, the last speaker, whose speech applied about as much to Morphology as it did to the planet Mercury, held up a well-formed Dahlia bloom, and asked if Morphology could produce that! It being understood that no one else was to speak on the subject, of course Morphologists had no opportunity of answering the question, which to me was cause of regret, because the same speaker on another occasion remarked that "The Dahlia was, in the recollection of many persons, a single flower; a row of five or six petals was all that could be seen. A large yellow eye, which delighted botanists, and the five, six, or seven single flat petals, possessing no other novelty than colour, were all that there was to admire." Now that the Dahlia has at least ten times as many petals as formerly, quilled instead of flat, and the "large yellow eye" has disappeared, a proof is given that a change of organs has taken place in it; to what cause, then, may we attribute the production of a double Dahlia? The same authority remarked that "The Dutch florists outran us in the production of double Dahlias; and while we were trying hard in this country to improve the flower, or, as botanists call it, spoil it, our Dutch brethren produced them fairly double." No doubt they did. But did our Dutch brethren set themselves to work in the first place to create a principle in the plant, that would admit of being wrought upon by artificial appliances, so as to change the structural formation and habit of its progeny to a wondrous, but as yet unknown extent? Or did they find that such a principle was inherent to the plant, ready to yield obedience to the skilful operations of man, for the gratification of his wishes, as in a thousand other instances? To assert the former is to make man a creator, to admit the latter is to admit the truth of that which harmonises with every known process through which matter passes from the simple elements to the highest compounds in organic nature, namely, the doctrine of Morphology. Whose opinion, then, savours the most of atheism—that of the Morphologist, who believes that the various organs of plants are convertible from one to another, and that they were made by nature susceptible of receiving modifications from external influences; or the anti-Morphologist, who ascribes every transformation in the vegetable kingdom to either chance or the art of man? Common sense will answer the question. I should not have made these remarks had I not been informed that four or five out of the 18 persons who voted against Mr. T. Moore's excellent motion for farther inquiry into the principles of Morphology were respectable gardeners. I trust that those persons will, for the sake of their own credit, and that of their Society, look a little more closely into the subject before they allow a blind scepticism again to associate them with parties whose object has always been to degrade the character of gardeners.—*W. Sherwood.* [If we had any influence with those persons in the Regent's Park Society who have shown themselves on this occasion men of intelligence, as many of them have, and very much to their credit, we should recommend them to separate from the blockheads with whom they are now associated. It is a pity that gardeners should waste their time in discussions with gardenasses; for thus we translate the terms *Eucepurus* and *Asinocepurus*, which distinguish the two great divisions admitted by Dr. James Bradley, in his amusing and instructive *Cepurologia;* a monograph which we may possibly republish some of these days, when we have collected a sufficient number of portraits to illustrate the numerous species distinguished by Bradley under each head. In the meanwhile, the following extract from one of the admirable articles in "Chambers's New Edinburgh Journal," should be committed to memory by all the parties concerned. "There is, on the other hand, a scepticism which does not strictly follow reason, but depends in a great measure upon ignorance, prejudice, self-conceit, and other unworthy feelings. We are apt to pronounce an unfavourable opinion of a new hypothesis without any examination, merely because it does not agree with ideas already established in our minds, when, if these ideas were rigidly tested, they might be found either erroneous, or far short of the full measure of the truth. It has been remarked by Adam Smith, as the cause of the feeling of wonder, that we lack something to connect our ordinary ideas with the new one presented to us: not seeing the whole chain of natural causes, we marvel. Now, marvelling is so agreeable to some minds as to form an inducement to their believing in novelties; while with others, of a more rigorous or cautious character, it presents only a ground of suspicion. Thus to treat novel doctrines may be well so far; but if it be allowed to operate beyond the extent of a salutary caution, if we invariably shut our ears against new hypotheses, and persist in refusing them all opportunity of showing evidence in their own favour, merely because some weaker, wonder-loving persons receive them too readily, we obviously incur the risk of repressing the advance of truth. And it cannot be doubted that if those who receive all without discrimination are reprehensible, so also are those who reject all without discrimination. When their doing so is partly, as often happens, a result of mean personal feelings, it is certainly worthy of the strongest reprobation. It is impossible to imagine a sincere lover of truth acting in such a manner."

Seedling Cereus.—I herewith send a bloom of a seedling Cereus, raised in all probability from longissimus crossed by truncatus; the habit is decidedly pendulous, and it makes shoots of about a yard in length or more in one season, presenting a very handsome appearance. It is edged round the petals, and has a faint stripe down the middle of each petal. I may add that this flower was produced by severe ringing, by which mode I am inducing a number of seedlings to flower.—*Robert Errington.* [The bloom sent was very double, and measured fully 3 inches across. The colour was a delicate pink, with a slight tinge of purple, and having a darker stripe of pink up the centre of each petal. It is a very pretty and desirable variety.]

Foreign Correspondence.

Wellington, Port Nicholson, New Zealand, May 13th, 1844.—After a very fine passage I am happy to inform you that I and my family are all quite safe and well in New Zealand. You know that we originally intended to go to Nelson, to Captain Wakefield; but owing to his death, of which you will have heard by the time that this reaches you, we stopped at Wellington, where we all got good employment. I have been all day moving fruit-trees in Mr. Stokes's garden, which, although they were very badly arranged, and had only been planted eighteen months, had thrown out such roots, shoots, and fruit-buds, fully equal to those that had been planted five years in England. The climate beats all I ever heard of, and I have no doubt that it will in a short time be one of the finest countries in the whole world. The Wheat, even on the tops of the mountains, of which there are plenty round Port Nicholson, yields from 45 to 50 bushels per acre. The flour for the consumption of the settlers has been mostly supplied from Sydney and Valparaiso; but from the continual motion of a windmill which has lately been put up very close to some gardens which I have been working in, I consider in a very short time we shall be obliged to send some of our own New Zealand flour to the above-mentioned places to get rid of it. I was up at the valley of the Hutt, which is eight miles from Wellington, last week, to prune some fruit trees for Mr. Molesworth, one of the principal settlers here, and I slept at Burcham's, who has a very fine public house up there, and is doing extremely well; both he and his wife send their best respects to you. I am happy to inform you that they are both good friends to me and mine. My eldest daughter is stopping with them at the present time. I have taken a few acres in the valley of the Hutt, a short way above Burcham's, where I intend to establish a fruit garden and nursery; it is one of the sweetest spots that ever was beheld by the eyes of man. The beautiful River Hutt incloses one part of it, and the other is belted by a range of mountains, which are crowned with the most splendid trees from 50 to 150 feet high; and out of respect to you, my dear sir, I have called it "Loudon's Vale." I am afraid the Wellington gentlemen won't much fancy me leaving them; but I shall be obliged now and then to come and prune their trees for them. I have had capital success with Snow's Cucumber and Green-fleshed Melon. They seem to beat anything of the sort that was ever in this part of the world. We have had two Horticultural Shows since I have been here, at which I was one of the judges both times, and it would surprise you to see what the place produces, although as it were only four years old. I am glad to say that your friend Mr. Stokes, who desires to be kindly remembered to you, has carried away all the head prizes. I am collecting seeds of all the best New Zealand plants to send you, and by the next ship that sails from this port you may expect a small box of them. I have got on the table now before me a parcel of berries of the New Zealand Yew, which I am drying for you. You will please to write to Mr. Brooks, and remember me kindly to him, and tell him that I will send him a few things for his Arboretum, and also in course of time some New Zealand curiosities for his Museum. My family are all well satisfied with the country, and never express the least wish to return to England again. My eldest son is employed in a large store, and my youngest is in the Medical Hall with Dr. Dorset, the gentleman off whom I have taken the land, and who has been very kind to all my family, and indeed, I have met with nothing but kindness since our arrival here. My two daughters have been working at plaiting straws for bonnets, the first that has been done in the colony; it was exhibited at the Horticultural Show, and is greatly in demand by every one as

much superior to the manufacture imported here. There is a beautiful native Ribes here which grows 40 or 50 feet high, on which I have budded both the Gooseberry and the Currant, both of which have taken well and are growing amazingly. I have budded also the Pear upon the White Thorn, which is also doing well. In fact, budding and grafting may be carried on here all the year round. All sorts of provisions are cheaper here than in England, and wages above double; but I am sorry to inform you that high wages have caused a great deal of drunkenness and idleness in the colony. I am keeping a journal of the weather, which I will send to you by-and-by. We have had several earthquakes lately; one of them was a tremendous shock. There is a great deal of rain here in the winter season; but often we have as fine days as in the middle of summer. Our winter is just beginning now; but vegetables grow better in some instances in the winter time than in summer. I shall embrace every opportunity of writing to you, and if a regular correspondence will be agreeable to you, I shall be most happy to keep it up. Owing to the unsettled state of first coming into a strange place, I have not been able to gather much information worth putting in your Magazine; but I hope that when fully established in a place of my own, I shall be able to send you some good botanical subjects worthy of inserting. I have sent upwards of 100 native plants to a gentleman in Van Diemen's Land, who has promised to send me fruit trees in return. Give my best respects to Mrs. Loudon and Mr. Wakefield, to whom I shall write soon. I hope you will write me soon, and if you can inclose a little of the best Calceolaria seed from Mr. Snow in it, I should feel greatly obliged to you, as there is not one single plant of it in the colony; also a few Rose seeds, or in fact anything that you think is worth sending. Wishing you all health and happiness, I am, Sir, your obedient servant, *Wm. Trotter.* [*Verbatim copy of a letter addressed to the late J. C. Loudon, Esq., and kindly communicated by Mrs. Loudon.*

Societies.

MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

(*Continued from page 719.*)

The President stated, that notice had been given of a Paper by Mr. Fox Strangways, on the Phosphorescence of Mosses, but the Paper had been lost, and he would merely refer to it as a subject of discussion.— Mr. Babington stated, that in company with Mr. Borrer, he had witnessed the peculiar luminosity of the Moss Schistostega pennata. — Dr. Lankester then gave a short account of the present state of our knowledge with regard to the various kinds of luminosity in plants, being the substance of some communications he had made to the *Gardeners' Chronicle* shortly after the subject was discussed at the meeting of the British Association at Cork.—Mr. Schomburgk had often observed luminosity in plants in the forests of Guiana, more particularly of the Fungi. He had also seen phosphorescence given out from the decomposing roots of Cassava. —Professor Balfour did not think that Meyen's theory of a slow combustion being the cause of the light could be admitted, because if it were, the light would be greatest where combustion was most active; and this was known to be greatest in the Araceæ, where there had been observed no light.—Professor Allman repeated the statement he had made last year, that the light observed on highly-coloured flowers was an optical illusion. If it were a real light from combustion or phosphorescence, it would be seen best in the dark; but the luminosity referred to was best seen at twilight.

Mr. Robert Patterson, having observed that all the churchyards which he had seen in York were profusely covered with Marigolds, inquired if there was any superstition connected with this practice.—Mr. Schomburgk observed, that it was much more customary in Germany to deck the tombs of the dead with flowers than in this country, and there they planted the Marigold because it bloomed later than most plants.

A Paper was then read by Mr. T. Allis, on some of the rarer forms of Ferns in his own collection, and on their mode of cultivation, &c. The collection of Ferns which had been brought from Mr. Allis's house, and placed in a tent in the Museum grounds, contained several rare species of Ferns, and amongst others, Danæa chrysophylla, Pteris rotundifolia, Cibotium Billardiasi, Gymnosphæra chærophylla, and a species of Didymochlæna.

"In the cultivation of Ferns, I find many that are of constant character; they may be more or less vigorous, but the characters remain unaltered, and the eye at once recognises them. Others, again, are subject to considerable alteration, as in some of the Adianta. Affine has usually only three digits, but I have plants in a vigorous state of growth with the number of digits increased, and quite undistinguishable from the allied species pubescens. In Newman's "British Ferns," Polypodium Dryopteris and calcareum are considered as one; with me they retain their distinct characters under all circumstances of growth. I have grown them in peat beds within a few feet of each other; there calcareum retains its peculiar hue from the first appearance of the frond above ground; its greener and more chaffy stem, and its more rigid appearance; and I always find that it sends up fewer fronds than Dryopteris, which are almost always fertile. These distinctions have been retained growing in a peat bed, in common garden soil, in pits in the house, and when raised from seed. As a general rule, though liable to exceptions, I find that plants which have other means of propagation than from seed, fructify less freely than those which grow by an extension of the rhizoma, or which propagate themselves by sending out young plants at the extremity of the frond, as is the case with Asplenium flabellifolium, Danæa, and Asplenium rhizophyllum, which generate a young plant near the under extremity of the frond, as Woodwardia radicans, or which have young plants sprouting from the upper surface of the frond, as is the case with Aspienium viviparum. On the other hand, Aspidium bulbiferum is an exception to this rule; this plant bears an ample crop of little bulbs, which fall off and germinate freely, like the little black tubers from the Tiger Lily; while, at the same time, the frond is covered on the under side with sporules. Asplenium viviparum and Woodwardia radicans have never fructified in my possession. Another instance occurs in Aspidium thelypteris: we have one locality in this neighbourhood where it grows under wood, in an open peaty soil, and where we may find it scattered over acres, and scarcely find a single fertile frond. In another locality, where the rhizoma has not so free a range, it fructifies freely; and in my own garden, in a stiff soil, almost every frond is fertile; while in a peat bed, about three yards off, almost every frond is sterile. I know not whether botanists (a name to which I have no pretension, though offering a Paper in the Botanical Section) would expect to find crosses or new varieties spring up from seed in a class of plants which have no recognisable organs of generation; but we find it so in practice. I possess a species of Gymnogramma, which was obtained from seed by Jas. Henderson, gardener to Earl Fitzwilliam, at Milton; it is different from any previously cultivated species. I also have a plant of my own which appears to be—and I have no doubt it is—a Pteris, unlike any plant I before possessed, or that I recollect to have seen. From its appearance, I should take it to be a cross between Pteris hirta and flexuosa, but unfortunately the latter beautiful plant has never fructified with me. I find a great difference in the frequency with which the Ferns propagate themselves spontaneously from seed; the genus Pteris is among the most frequent, and springs up of various species in all directions. Blechnum, Doodia, and Gymnogramma also spring up freely, and some species of Diplazium, Cheilanthes, and Dicksonia frequently occur. Of Polypodiums I have had very fine seedlings; the same may be said of exotic Aspidiums; and only a few Aspleniums. I have this year adopted what I believe to be a new method in raising Ferns from seed, and, as far as I can at present judge, with complete success. The plan I have adopted is to obtain a block of peat turf, such as is sold in York for the purpose of lighting fires; that I thoroughly soak in water, and then place in a Cucumber-frame. On these turfs I sow the seed, and, keeping them shaded from the sun, I have a good crop of plants; but I am yet unable to determine whether they will prove to be the species sown, three of which have not before been, as I believe, cultivated in England; the species are Polypodium membranæfolium, Asplenium variæfolium, and Alsophila excelsa, all from Norfolk Island. The seed of Ferns is so volatile, and so fills the air, that though I have used a good deal of care to prevent seed from my pinery finding its way to my seed-beds, I am as yet unable to assure myself of possessing the new species. In the work on Australia, from the pen of my friend and relative James Backhouse, there is notice of the occurrence of many species of Ferns; and from his observations on the native habits and habitats of several species, I have derived great advantage, especially so by planting a considerable number on decayed trunks of trees, where they grow with a vigour such as I never before experienced: a particular instance is the beautiful Asplenium nidus, a plant I have had for years, but which was always in so feeble and rickety a state, that it was scarcely able to maintain existence, and I had sent it out to nurse, under the care of our experienced curator, in the Orchidaceous stove in these premises; still it never put on a healthy appearance till I planted it in part of the stump of an old Willow, where it now flourishes in the greatest vigour, and is putting forth its fertile fronds."

After the reading of this Paper, the President and members of the Section repaired to the tent in which Mr. Allis's collection was placed, where he gave a further account of some of the more remarkable species.—*L. E.*

(*To be continued.*)

COUNTRY SHOW.

Staines Celery Show, Oct. 22.—At this Exhibition some excellent samples of Celery were produced, and several prizes were awarded; but we have only been furnished with a list of awards, without the sorts of Celery being specified for which these awards were given.

Reviews.

Elements of Agricultural Chemistry. By Sir H. Davy, Bart. A New Edition, with Instructions for the Analysis of Soils, and Copious Notes. By John Shier. 8vo. Glasgow. 1844.

This book is a reprint of Davy's well-known Lectures, delivered before the Board of Agriculture, with a commentary of notes by Mr. Shier. The Editor has evidently taken great pains to collect as much useful information as he could, and the notes are for the most part clear and intelligible. It is, however, not very evident for what class of readers the book is intended. For chemical students, the details are frequently very meagre and incomplete; if, on the other hand, it is intended for farmers, we fear that a great deal of it will be quite unintelligible. All use of chemical symbols must be avoided in books intended for farmers, if it is desired that they should understand what they read.

Garden Memoranda.

Chatsworth.—The works at this seat of magnificence are proceeding with unabated activity. During the summer two new fountains have been set in action, of which one, called the Emperor, from a single jet throws a column of water nearly 300 feet high. The force of this fountain may be imagined when we state, that in an hour it lowers an acre of water to the depth of a foot. The other, quite unique in design, consists of several jets, whose copious streams rise and fall alternately, producing the appearance of dancing water, and an effect perfectly enchanting. In addition to these, huge masses of rock are collecting and forming into a rockwork, the like of which has never before been seen. Some of these masses weigh upwards of 370 tons. In one place they are put together in exact imitation of the Strid—a rocky stream at Bolton Abbey—and when completed will form a wild mountain torrent some 300 feet long, with banks full 13 feet high. Such gigantic works are necessary at Chatsworth, where smaller things would be lost amidst the grandeur of the place. The great Conservatory now contains some most beautiful specimens of Zamias, which find themselves in better quarters than if they were at home, and Ficus repens has almost covered a mass of rockwork with a tropical screen; Bougainvillea spectabilis was in flower too upon the roof, the first time we believe that its beautiful heads of rose-coloured blossoms have been produced in England. Those who would know what Fuchsia corymbiflora may be, should visit the gardens near Mr. Paxton's residence. They will there find it with a strong stem, 10 feet high, from the top of which spreads an umbrella of branches, each of which is terminated by long clusters of its beautiful crimson flowers. In the same part of the grounds will be found the Orchidaceous house, crowded with plants in rude health, and tastefully arranged with trunks of trees, so as to resemble an old grove; and near them a most singular unknown succulent coral-like leafless plant, covered with beautiful specimens of a golden Lichen, which appears to be Dufourea flammea. This curious specimen, which has not been recognised as yet by any botanist, was sent to his Grace the Duke of Devonshire, from one of the most arid parts on the west of Tropical Africa.

Glasnevin Gardens.—The splendid Grass, Gynerium argenteum, which, if at all known, is extremely rare in British collections, is now in full flower in these gardens, where it has stood, without any protection, during the last three winters. Mr. Tweedie, who sent the seeds from Buenos Ayres, after stating the dimensions to which it attains on the extensive pampas of that country, further adds, that "it is the most showy plant of any class." This is no doubt saying rather much for it, though it is certainly a splendid object as it occurs here at present, with the culms rising to a height of nearly 10 feet. The flowering panicles are 18 inches long, compact and well-formed; both in shape and apparent texture resembling the white feathers worn in military caps.—*D. M.*

Miscellaneous.

Transplanting Trees.—When all was clear and the tree ready for transplanting, it was raised out of the hole in which it grew, by bringing the head down on one side by means of ropes and throwing earth under the bottom of the ball and roots, then doing the same on the opposite side, again filling in with earth and repeating this on alternate sides until the bottom of the ball was level with the surface of the ground. In the next place, care was taken to choose the flat or hollow side of the tree to rest upon the bolster when lowered; for if the tree shifts or turns during its carriage, the bark will be injured and the head and roots broken; the wheels were then put in such a position that the top of the bolster was close to the ball of earth at the foot of the tree, the pole or beam raised, and the ring and top fastened with flat rope to the body of the tree, the latter having been previously wrapped with matting to keep the ring from bruising the bark. The bottom of the tree was well secured to the bolster by ropes and chains passing under the ball, the bark being again protected by means of matting, and the tree then forced down upon the machine with ropes and pulleys, and so made ready for removal. The horses were now yoked by chains to the axle of the machine, and the tree drawn out roots foremost; but as the fresh earth was of course too soft to bear the pressure of the wheels cordwood was placed under them until they came on firm ground. It is absolutely necessary that the roots of the tree should be a little heavier than the head, and this will always be the case if the above plan is carried out, except in very light sandy soils. Equilibrium was maintained by one of more men who acted as balancers in the top of the tree so that by shifting their situation as occasion required the whole weight was thrown upon the wheels, and the roots and branches both preserved from injury. The tree was guided by the director, who had two lines fastened to the bole of the tree, a few feet above the top of the pole of the machine, and carried between and to the extremity of the branches where he took his station, and thus was enabled to guide the machine with the greatest accuracy. On arriving at the side of the pit, which had been previously prepared for the reception of the tree (the best side of the tree being placed to front the coach road), the wheels of the machine were gradually lowered down the inclined plane, cut for the purpose from the surface of the ground to the level of the pit; the tree was then placed in the centre of the pit, set upright, the machine removed, and the roots carefully adjusted while the soil was thrown in, watered and rammed around them until the tree was well fixed, the long roots being so placed and worked up and down that they acted as a stay in keeping the tree upright. To the roots of each large tree two cubic yards of good earth and lime compost, and one of sifted coal ashes were added, and the same mixture for the smaller trees in proportion. In every case care was taken not to plant the tree deeper than it grew before. The situation allowing water from a brook to be turned over the ground around the trees, it was well soaked once a week during the first spring and summer, every nine days the second year, and every fortnight the third year; it was also covered with moss straw, &c., for the same period to protect the young roots from frost in winter and drought in summer. No a sprig was intentionally taken off the heads of any of the trees, nor was any one of them propped or secured with ropes when first transplanted, although the situation is much exposed to the south-west. Every tree removed upon Sir H. Steuart's plan has lived, and this, no doubt, has been partly owing to the manure and regular watering; in fact, the method has succeeded so well that it will be seen by a comparison made with two Oak trees now growing in the field from which the first four were removed in 1832, that No. 1 removed has exceeded No. 2 not removed, and No. 3, which was 70 years old at the time of its removal, has increased in girth within a quarter of an inch of No. 2 not removed: these trees are very similar in appearance. This result is the more extraordinary, as no large tree increases in size for the first two years after its removal; therefore these trees have increased as much in nine years as those not removed in eleven years. It is generally supposed that the cost of removing large trees must be great, but this is also

not to be the case by the fact that the first four Oaks were removed in 1832 (my first attempt), at an expense of 8*l.*; the remaining 16 Oak and Elm with six soft wood and large Apple trees, for 23*l.* 2*s.*, being about 21*s.* per tree. The best and cheapest plan is to prepare the trees during the winter, three or at least two years before transplanting, by cutting off all the roots (except two or three of the largest on the south-west side, to be left for stays when the tree is removed) at 4 to 5 feet from the bole of the tree, making a trench 2½ feet wide and to the depth of the roots, at that distance from the stem, all round the tree. The trench is then to be filled with the best obtainable mould, mixed with a little lime, and covered over with moss, straw, &c. If the tree be healthy, in two or three years the whole of the trench will be filled with fine fibrous roots, and care being taken not to injure these, the tree may then be removed with the almost certainty of growing if regularly soaked with water, the roots defended, &c., as above described. **The following are the particulars of the great Risca Oak, near Newport, Monmouthshire, purchased by Thomas** Harrison, in 1814, at 100 guineas, converted and sold by him for more than 400*l.* :—The body or bole of the tree was only 10 feet long, and measured 450 feet; there were in the limbs twelve navy pieces, one of which made a rudder for a 98-gun ship, and the whole of the sound timber in the tree was 48 loads and 11 feet, of 50 feet to the load. The bark was only about 4 tons.—*R. W. Purchas, Pilstone, near Chepstow; March*, 1844.

TREES TRANSPLANTED, MARCH, 1832.

No.	Sort of Tree.	REMARKS WHEN TRANSPLANTED.	Age.	Girth at 4 ft. from ground. 1832.	Girth at 4 ft. from ground. 1843.	Increase in 9 years.	Height to top of Spray. 1832.	Height to top of Spray. 1843.	Increase.
				inches	inches	inches.	feet.	feet.	ft.
1	Oak.	Good head, well rooted, handsome tree	48	33¼	45⅝	12½	29	34	5
2	Ditto	Rather small head and roots. The top shoots were so much injured by frost in May, 1834, that 2 feet were cut away	60	44	54	10	40	45	5
3	Ditto	Large spreading head, no roots on one side. This tree grew close upon the side of a deep hollow lane	70	47	62¾	15¾	28	44	6
4	Ditto	Good head, well rooted, handsome tree	50	35¾	44¾	9¼	28	34	6
		N.B.—It is singular that Nos. 1 and 4 bore acorns in 1834, which were planted but did not vegetate.							
		TRANSPLANTED, MARCH, 1834.				Increase in 7 years.			
5	Ditto	Kind large head, very difficult to get out; nearly all the roots broken off	55	43½	46½	3	35	39	4
6	Ditto	Middling kind head, well rooted	50	33½	39½	6	32	37	5
7	Ditto	Kind, large upright head, very difficult to get out; loaded thrice; nearly all the roots broken off, and scarcely any soil left on the ball	65	50⅜	55⅜	5	42	45	3
8	Ditto	Prepared 1832: middling head, good bark, very good roots, from 1 to 2 feet long, since prepared	45	36	42½	6½	28	35	7
9	Ditto	Prepared 1832; middling head, good bark, very good roots, from 1 to 2 feet long, since prepared	30	29	36	7	31	38	7
10	Ditto	Fast growing, bark white, slender head, roots small and few; grew in a very sheltered situation with No. 15. The bark would have stripped when removed	40	31	37¼	6¼	26	32	6
11	Ditto	Bark very rough, kind head, all the roots cut round at 2½ feet from the stem when transplanted	35	25	34	9	24	32	8
12	Ditto	Rough bark, good head and roots, but a slow-growing tree	50	36½	44¼	7¾	24	31	7
13	Ditto	Bark thin, handsome sugar-loaf head, very badly rooted	55	38	43	5	38	40	2
14	Ditto	Bark middling, very kind head, well rooted on one side	52	36½	46¼	9¾	43	46	3
15	Ditto	White bark, middling head, middling rooted, fellow to No. 10	30	22⅜	28½	6	25	32	7
16	Ditto	Rough bark, well rooted, middling head	45	26	31¼	5¼	28	37	9
17	Ditto	Bark good, very good roots, large, kind, round head	20	20½	29	8½	15	19	4
18	Ditto	White bark, middling roots, kind head	20	18½	28¼	9¾	19	27	8
19	Ditto	Bark good, unkind ivy tree (grew under 7), roots cut round as 11 (died the second year)	40	22	—	—	—	—	—
20	Elm	Kind tree, very badly rooted, nearly in leaf when moved	25	26	40	14	25	33	8
21	Wytch Elm	Kind, large head, very good roots, not forward in leaf	25	34	43½	9½	24	31	7
		The greater part of the Oaks transplanted in 1834 were growing in Coppice Woods and Plantations, upon very sidelong ground, which made it difficult to load them, and would not have been transplanted if better subjects could have been found.							

TREES GROWING UPON BIGSWEAR ESTATE NOT TRANSPLANTED. (HEIGHTS NOT TAKEN.)

No.	Sort of Tree.	REMARKS.	Age.	Girth at 4 feet from ground. 1832.	Girth at 4 feet from ground. 1843.	Increase in 11 years.
				inches	inches	inches
1	Oak	Good bark, small head	60	44½	55	10½
2	Ditto	Good bark, very large handsome head	65	55½	71	15½
		These Trees are growing in the same field from whence the first four transplanted Trees were taken.				
3	Ditto	This tree grew from a stake put in the hedge, large handsome head	40	54½	65¼	10¾
4	Ditto	Grows upon the high bank of a brook, handsome head; some roots were cut off in 1832	70	56¾	62	5¼
5	Ditto	Tall, upright, fast-growing tree	50	40	52	12
6	Ditto	Tall, fast-growing, kind tree	40	26	38	12
7	Ditto	Pollard, cropped about 20 years	100	70⅜	75	4¾
8	Ditto	Fine, handsome, large headed tree	90	100	105	5
9	Ditto	Remarkably handsome, large headed tree	90	107½	116	8½
10	Ditto	Transplanted about twenty years ago; was then ten years old	20	5¼	17½	12¼
		The first five Trees are growing in the same meadow as the transplanted trees, and the others in the meadow adjoining.				
1	Poplar	Black Italian. These Trees were transplanted in 1823, then five years old, by the side of a brook in the meadow adjoining to the transplanted Trees.	15	30	57½	27½
2	Ditto		—	28	54¼	26¼
3	Ditto		—	21½	43	21⅜
4	Ditto		—	23¼	47¼	24
				1836.	1843.	Increase in 7 yrs.
1	Oak	These Trees are growing in the Coppice Wood along the side of the carriage-road leading from Bigswear House to Saint Briavels, and are generally healthy and kind.	50	31½	37½	6
2	Ditto		50	36	44	8
3	Ditto		21	15¼	23	7¾

9	Ditto		38	28¾	34¼	5½
10	Ditto		55	42⅝	46¼	3⅝

MEASURE OF ELM-TREES GROWING UPON BIGSWEAR ESTATE, AT PILSTONE, NOT REMOVED.

No.	Sort of Tree.	REMARKS.	Age.	Girth at 5 ft. from ground. 1835.	Girth at 5 ft. from ground. 1843.	Increase in 8 years.
				inches	inches	inches.
1	Wytch	In the Meadow above Bigswear Bridge.	70	112⅜	118	5¼
2	Ditto		—	101	107⅛	6⅛
3	English		—	100¼	109¼	9
4	Ditto		—	95⅛	105⅛	10
5	Ditto	Near to Pilstone	60	90	103	13
6	Ditto	20 yards from ditto. This tree was prepared for removal Feb., 1836; but circumstances prevented its being done. It did not recover its foliage for two years, and it will be seen by comparing it with No. 5 that its growth was much retarded.	—	74	80¼	6¼

—*From "Transactions of the Monmouth Farmers' Club."*

Large Potatoes.—There is at present to be seen in the shop of Mr. J. Ramsay, High-street, Forfar, five Potatoes of the Blucher red kind, weighing fully 8 lbs. (one of them weighs 2 lbs. 3 oz.), all grown on one stem, in the garden of A. Donald, Muir of Lownie, parish of Dunnichen.—*Montrose, Arbroath, and Brechin Review.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

By the end of October stove plants, not winter growers, should be thoroughly ripe, and therefore require less heat than they had for the last six weeks. 60° is now high enough at night, and that should be about the standard heat for the next six weeks; after that 55° will be high enough till the return of fine weather early in spring. If the air in this house could be kept as pure as that in the conservatory through the winter, the plants would require very little ventilation when at rest, but with strong fires this cannot be done, and the air must be changed as often as the weather will permit. Currents of cold air, however, are injurious to stove plants, and it is better to open all the ventilators, doors, &c. for one hour on a fine day, than to give three or four hours' ventilation on a small scale. One of the most graceful winter-flowering stove plants is Acacia kermesina. It is a plant of the easiest culture, and flowers on the top of the shoots, and, like all plants with this habit, it should be often stopped when young, to induce a quantity of side-shoots, as the more shoots the more flower-heads. Grafted standard high on Acacia affinis, its near relative, it would form a splendid object in a short time.

Conservatory.—Lyonœa tyrianthina and Tacsonia pinnatistipula are two beautiful climbers for this house, requiring exactly the same treatment, but rather difficult to manage in modern structures, as they are impatient of confinement and do not like bright sunshine. The best way to treat them is to plant them in the front border, and to have the tops taken out to the open air through the summer; but this style is inadmissible where a conservatory forms part of an architectural assemblage; in that case they should be planted near the doors, or source of ventilation, or against the back wall; in either case they should be trained low and kept partially shaded, and never allowed to get to the top of the house. They are good subjects for old fashioned dark houses, where they may ramble at ease. Because Chrysanthemums are thirsty plants, and apt to draw in confinement while they are growing, some people think they must have large doses of water and a free circulation of air while they are in bloom. Try them, however, in a close, cool, dry house, and you will find that half the usual quantity of water is enough for them; they will keep in bloom longer, and do not become drawn: the reason for this is well explained in the Leading Article of last week.

Pits and Frames.—It would occupy too much room to name a third of the plants that are fit for winter forcing, so much having been already said about them. I always look at the report of Covent Garden Market for the cut flowers that are on sale in winter, which is a good index to what is done in this way round London. I am puzzled about how they manage the Bignonia venusta, so as to have it in succession so long and so much out of its season. Will any kind reader supply the information?—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

The business of this department is now in a great measure confined to the clearing up of leaves, wormcasts, and other extraneous matters, and making the lawns, &c., look as tidy as the season will admit of. If the bulbs are planted—and if they are not, no time should be lost in getting them into the ground—those beds which are unoccupied may receive their winter digging, or, where necessary, winter trenching, taking care, if the soil is strong, to expose it as much as possible to the action of the atmosphere. While, however, you dig the beds, avoid touching the shrubbery borders; for though custom, which too frequently makes us commit sad blunders, may say they look much better after being dug, depend upon it plants do not grow any faster for being annually root-pruned, and such is the effect of annual digging. Worms are now very troublesome, especially in wet weather, when it is difficult to clear their casts away; but their ranks may be materially thinned by watering the ground with fresh lime-water, or with water containing corrosive sublimate; though in the latter case they are merely driven out of the ground, and require to be gathered up by hand, and afterwards destroyed. Corrosive sublimate is very quickly brought into a liquid state by mixing it with spirits of salts.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas—If in their winter-quarters, should be protected from damp, and especially from rain finding its way through the glass of the frame, and dripping into their hearts. In order to prevent this, the laps of the glass ought to be puttied. If pots get soddened with rain, and neglected but for a few days, the destruction of the plant is almost inevitable. *Polyanthuses.*—We have these in full flower; it is not, however, advisable to permit this, or to allow the plant to weaken itself by blooming at unseasonable periods. Newly-planted offsets, when small, are apt to be dragged out of the ground by the earth-worm; the borders should therefore be looked over till the plants have taken fresh root. *Dahlias*—In many parts of the country have been cut off by the late frosts; where that is the case they should be taken up (else they will start again at the crown), and after being tallied with zinc labels, which have been numbered and attached to the roots with strong metallic wire, they may be hung up for a few days in a dry airy shed, preparatory to cutting off the stems and storing for winter; where they have escaped, which is the case in high situations, every precaution should be taken (by drawing the soil round the root) to prevent injury, in the event of a sudden change of weather. *Tulips.*—We have taken advantage of the late fine dry weather, and planted our Tulips; and, certainly, the sooner they are in now the better. Reference may be made to Articles, in late Nos. of the *Chronicle*, on the Formation of Beds, Planting, &c.; the information there given may be safely acted on. *Carnations.*—Get in your stock as quickly as possible. We must enter our protest against obtaining fresh varieties from a distance, after the first week in November, unless the layers are extremely healthy and well rooted.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Where plants are swelling their fruit the temperature need not now exceed 65° at night. It should not, however, be allowed to fall below 60°, and it should be raised to 72° by fire-heat by 8 o'clock in the morning. Syringe on fine clear days, and whenever a small portion of air can be given, it will be advantageous to open the top ventilators a little, if but for 20 minutes or so, about mid-day. Now that oak and other tree leaves can be had, it will be well to use half leaves and half dung for lining the pits heated by fermenting materials. The leaves will serve to make the heat more uniform and more lasting. Give no water to the succession plants during dull weather, excepting to such plants as are near the flues or pipes, and that get over-dry in consequence.

Vineries.—Remove all fading leaves from the Vines on which fruit is hanging, and keep the house free from everything likely to create mould or damp. When there is any appearance of frost in the evenings, let sufficient fire be made to keep the temperature up to about 40° during the night.

Peach Houses.—If the lights are still off the Peach-houses it is time to put them on again, giving them all the air possible. If the trees in the late-house have not yet ripened their wood sufficiently, continue to assist them by making slight fires during the *day*, giving at the same time plenty of air.

Fig House.—The pruning of Fig trees, like that of Peaches, is best performed in the summer and autumn. Let whatever winter pruning required be done as soon as the leaves fade. Wash the whole of the trees over afterwards with soap and water till they are perfectly clean, and then mix soft soap and sulphur with warm water, in the proportions of half an ounce of soft soap and half an ounce of sulphur to a pint of water, and let the whole of the trees be well rubbed with the mixture. Put the house into a state of thorough repair and cleanliness, and then tie up the trees.

Strawberries.—If these have not been put into their winter quarters no time should be lost in getting them in, as the roots will suffer from too much wet.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Peaches and Apricots.—Remove all green laterals, that the growth of the trees may be checked, and with a new birch broom gently switch off the matured leaves, taking care not to injure the buds, repeating the operation at short intervals, so that the young wood may be ripened by exposure. To effect this still farther, cut out any small twigs that will not be wanted, and loosen from the wall those shoots intended for bearing next season as soon as convenient. Where unfortunately the leaves are still green and adhesive, no time should be lost in going over the trees, and cutting all the stronger leaves in two. As no great nicety is required, a man will soon go over a wall, by catching the leaves between his knife and thumb. This will tend to check luxuriance, and hasten the maturation of the buds, without rendering the shoots either shrivelled, or the

receptacles of unelaborated sap liable to break out in gum or canker, which in such cases is often the result, when recourse is had either to indiscriminate root-cutting, or a wholesale deprivation of leaves.

Cucumbers.—There is no difficulty in growing these at this season, or during the winter, in pits heated by hot water, or even a good flue, that will not allow the escape of smoke or deleterious gases, as it is easy to change a dry to a moist heat at pleasure. They may also be grown in pits with solid walls, or pigeon-holed and flued, heated with fermenting material alone; but without having abundance of dung, &c., it would be folly to attempt it. Less dung would be required for common frames, but much more caution in the management, to prevent the ingress of steam, and to keep the atmosphere in a healthy state. Those who still have good healthy plants in frames, will find them much benefited by surfacing the bed with rough chopped peat, and then covering the surface with tiles, which may be painted over with sulphur if there is any danger from red-spider. Those who are particular about Cucumbers at this season, will obtain them most economically, however, by building a narrow house on purpose, as all the work of attendance can then be done from the inside. The simplest system of heating by hot water will be the best, provided it secures a sufficiency of bottom and atmospheric heat. *Asparagus, Sea-kale, and Rhubarb.*—Preparations must now be made for forcing these where they are wanted for use early. For the first nothing is better than a late Melon-bed that still retains a moderate heat; or a slight hot-bed may be made so as to moderate the heat at pleasure, if it should prove too strong. Place the plants as thickly as possible, and so near the glass as just to allow the shoots to grow the requisite length, and then it may be had green or blanched at pleasure, unless the weather should be very severe. The best method to adopt for the two latter is to form a small hotbed in any convenient place; take up a number of roots, place them on it, with a little soil of any sort amongst them, and defend from the weather and light, by any old boards that can be obtained. Where a Mushroom house is at work, a better place could not be found. *Routine.*—Examine stored fruits and roots; plant Lettuce and Endive in frames—young ones out of doors to stand the winter; defend large Cauliflower from frost, and young plants from heavy rains. Mulch and dig about Globe Artichokes; cut down and dress Asparagus for the winter, though summer dressing is the chief thing to be attended to; remove all decaying vegetables, but take nothing to the rot-heap that any of the men can use for food; and so far as the falling leaves will permit, give every place a neat appearance.—*R. F.*

VII.—COTTAGERS' GARDENS.

The leaves being now for the most part off fruit trees, and the ground sufficiently moistened by the late rains, the Cottager, with every prospect of success, may transplant any trees he may wish to have removed. In rather light, dry soils, this is the best season for planting all kinds of fruit trees, if the weather is open and tolerably dry; and moreover, if any new kinds are wanted from the nurseries, there is now a better chance of having them good than in spring, when the nurseries have been picked many times over. The following list may be useful to those who are about to plant a new garden, or add to their present collection. Of Apples, I would recommend as dessert varieties, suitable for a Cottage Garden, the following, viz. Early Harvest, ripe in August; Kerry Pippin and Wormsley Pippin, September; Court of Wick, from October to March; Old Nonpareil, from January to May; Ribston Pippin, November to March; and Dutch Mignonne, from December to April. Sorts for Kitchen use may consist of Dumelow's Seedling, Bedfordshire Foundling, from November to March; Royal Russet, from November to May; Tower of Glammis, from November to February; and Waltham Abbey Seedling, from September to January. Of Pears for table, the following are good: Aston Town, from Oct. to Nov.; Marie Louise, Oct.; Beurré Diel, Nov.; Bacon's Incomparable, Nov.; Glout Morceau, from Nov. to Jan.; Beurré Rance, from March to May. For baking, the Catillac is most suitable. Those who are desirous of having a few Plums, may plant the following for dessert; viz. Green Gage, Coe's Golden Drop, Washington, and Royal Hative; and for kitchen use, the Orleans, Coe's Fine Late Red, Vine Sour, and Shropshire Damson: the last two are excellent for preserving. The ground intended to be planted with fruit-trees should be well trenched and manured, taking care that the latter is thoroughly mixed with the soil. Look over Cauliflower and Lettuce plants for slugs. If they are troublesome, sprinkle some hot lime among the plants; it will benefit the ground and destroy the slugs. Tie up Endive to blanch when dry, as, if done when wet, it is apt to rot. Attend to plants in pots; they should be kept rather on the dry side during winter; never water them except when they absolutely require it, and then give them a good soaking.—*J. McH.*

State of the Weather near London for the week ending Oct. 31, 1844, as observed at the Horticultural Garden, Chiswick.

Average			30.019	29.921	51.3	36.5	43.9		.33

Oct. 25 Rain; densely clouded; clear and fine.
— 26 Uniformly overcast; clear at night.
— 27 Overcast and fine throughout; frost at night.
— 28 Foggy; fine; overcast; foggy at night.
— 29 Overcast; dry cold haze; uniformly overcast; hazy; rain.
— 30 Drizzly; cold easterly haze; overcast; rain.
— 31 Foggy; fine; very clear in the evening; boisterous at night.
Mean temperature of the week 2 deg. below the average.

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending Nov. 9, 1844.

Nov.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat.	9	50.3	36.2	43.3	8	0.28	1	1	2	1	3	6	2	2

The highest temperature during the above period occurred on the 3d and 6th, 1834—therm. 63°; and the lowest on the 8th, 1837—therm. 22°.

Notices to Correspondents.

Bignonia jasminoides.—*Z.*—There are two varieties of this plant under the same name, one of which is the peerless beauty referred to; the other flowers sparingly if cramped in a small pot. But why grow this poor variety at all, when the other is all that can be wished?—*B.*

Cucumbers.—*A Beginner.*—Soil composed of three-fourths light rich mould from an old pasture, one-eighth vegetable mould, and one-eighth rotten dung, will produce Cucumbers in abundance. Keep the temperature of the beds about 65° at night, allowing about 10° of a rise in sunshine. Cover at night with mats, but they should always be removed by sunrise, in order to admit all the light possible to the plants. This is very essential to their welfare.‡

Grapes.—*Dido.*—The flame-coloured Tokay is the same as the Lombardy; bunches very large. The Red Tokay is different, the bunches being small.‖

Heating.—*F. R.*—An Arnott stove, *well managed*, will heat sufficiently a small greenhouse; but it must be furnished with an evaporating pan on the top, and it should also be a very well manufactured article.

Insects.—*D. L.*—We are much obliged for the twig of the Spruce-fir, which was, however, so injured by the carriage, that we could not make out whether the disease is a Coccus or an Eriosoma, and we beg that you will send us some of the winged specimens in a quill, which will enable us to determine the species; but we despair of suggesting a remedy.—*R.*—*F. D.*—Your Hollyhock capsules are infested by the Caterpillar of a Moth, which we found in them last August. We hope you will endeavour to rear them, in order that we may identify the species.—*R.*—*J. F. V.'s* curious larva is the offspring of an Hemerobius, and is eminently serviceable in destroying the aphides on Turnips, &c. Its history has been published in the 3d vol. of the "Royal Agricultural Journal," page 64.—*R.*—*Ingram.*—Your Strawberry-bed grubs are the larvæ of a fly, apparently allied to Bibio.—*R.*—*J. Wighton.*—The slug-like larvæ on the Pear-trees you will find described and figured in this Journal, vol. ii. p. 692, under the name of Selandria Cerasi.—*R.*—*Donna Ken.*—I am unable to tell you the names of the small larvæ, but I expect they are carnivorous, and, if so, useful. The others were so crushed it is impossible to say what they are. Quills and small pill-boxes cut down are far more secure than green stalks for transmitting subjects per post.—*R.*—*C. M'Gregor.*—I am much obliged for the minute animals, which are Acari; but I cannot tell you the species at present, neither am I aware that they injure the crops *R.*

Ivy.—*G.*—Very little is known upon the rate of growth in timber. An Ivy stem 45 years old has measured 7½ inches in circumference; therefore yours 8 inches in diameter may be assumed to be 135 years; but it is probably very much older. There is a formula for calculating such things, and if we can lay our hand upon it we will publish it.

Leycesteria formosa.—*H. S.*—This may be increased either from seeds or by cuttings. As you have saved seeds you had better keep them till spring, when you may sow them in the open border, where they will vegetate; but the better way is to sow them in shallow pans in light soil, and to keep them in a cool frame until the plants are ready for transplanting where you intend them to remain.‡

Madeira Fruits.—*C. W.*—"When I was in Madeira, now eight years since, I remember the following plants to have been cultivated, in addition to those mentioned in your letter: Eriobotrya japonica; Annona cherimolia, squamosa, &c.; Persea gratissima (Avocado Pear), Mango (but very stringy fruit), Coffee (excellent), Guayava (Psidium pomiferum and some other species in private gardens). Olives are no longer cultivated, owing to a nearly prohibitive law made in favour of the mother country, I have heard. The same may be said of sugar, which was formerly manufactured here, but was found to interfere with the South American colonies; it still exists, however. Almonds, Peaches, Nectarines, and Apricots can hardly be said to be in cultivation, according to our notions; that is, they are nearly in a wild state, and produce scarcely eatable fruits. Apples, Pears, Gooseberries, Currants, and other northern fruits, are only cultivated up the mountain, at about 1500 feet, in the merchants' country seats, and are seldom seen. Oranges are of an inferior description. Besides the above, I may mention that the Tamarind grows well in Mr. Veitch's garden, who also cultivates Tea, the Persea gratissima, and other exotics. There are other Musas beside paradisiaca in private gardens, but I never heard of their fruit being brought to table. No Palms but Phœnix dactylifera and Chamærops humilis are known to me. There are several vegetables which it may be as well to add, *e. g.*—Caladium nymphæifolium, whose roots are eaten by the peasants; Tamus edulis Lowe (a Yam), cultivated in the western corner of the island; Sweet Potato (Batatas edulis); Sechium edule (Chocho), a capital Gourd; Physalis pubescens (Cape Gooseberry) is wild (?), and is made into a very good and beautiful preserve. The Stone Pine is cultivated, but the seeds are not brought to table as in the south of Europe. Arachis hypogæa was introduced when I was in the island, but afterwards neglected. Many ornamental trees, &c. were in cultivation in private gardens, *e. g.*—The Silk Cotton-tree (Bombax), Screw Pine (Pandanus), Aloe vulgaris, Dracæna draco (?), Schinus Molle, Elæagnus angustifolius, Arbutus Unedo, Acacias (various), Liriodendron tulipifera, Magnolias (various), Caryophyllus aromaticus, Jambosa vulgaris, Eucalyptus sp. (one large tree in Dr. Renton's garden), Melaleuca leucadendron, &c. &c. There is also a Myrtus (?) from South America, with small pleasant fruit, whose name I just now forget, spoken of somewhere lately by Gardner. The Castor-oil plant is abundant, but turned to little account." *C. L.—n.*

Manures.—*A. B.*—Gas-water has been found to produce excellent effects on Grass land and many crops. Innumerable accounts of it have been made public in our columns formerly. We advise you to consult them. To gas-tar, however, we have nothing favourable to say, of our own knowledge.

Melon and Cucumber Seeds.—*Revertens.*—If these have been perfectly matured, they will keep good for several years. Two or three years old seed is reckoned better than that of the preceding season.‖

Names of Fruits.—*T. S.*—1, Marmalade Pippin; 2, Beachamwell; 3, Herefordshire Pearmain; 4, Nonpareil; 6, King of the Pippins; 7, Franklin's Golden Pippin; 8, Beauty of Kent; 9, Devonshire Buckland; 10, Dumelow's Seedling; 11, Beauty of Kent; 12, Scarlet Nonpareil; 13, Court-pendu Plat; 15, Wormsley Pippin; 16, King of the Pippins; 18, Royal Russet; 19, Syke House Russet; 20, Dutch Mignonne. 1, Chaumontel; 2, Glout Morceau; 3, Seckel; 4, Winter Nelis; 5, Marie Louise; 6, Easter Beurré.‖—*A. M. F.*—3, Catillac; 4, Uvedale's St. Germain; 5, Beurré de Capianmont; 6, 7, 9, Glout Morceau; 8, Winter Nelis; 10, Court of Wick; 11, King of the Pippins; 15, Norfolk Paradise.‖—*A. M.*—1, Spanish Bon Chrétien; 2, Uvedale's St. Germain; 3, Beurré Diel; 4, 5, 9, Easter Beurré; 6, Glout Morceau; 7, St. Germain; 8, Vicar of Winkfield; 10, Crassane. 1, 6, King of the Pippins; 2, Kirke's Lord Nelson; 4, Hanwell Souring; 5, Hollandbury; 7, Downton; 8, Stagg's Nonpareil; 10, Marmalade Pippin; 11, Baxter's Pearmain; 13, Golden Reinette; 14, Scarlet Nonpareil; 15, Beachamwell.‖—*T. A. B.*—No. 2, Autumn Bergamot. Your Apples appear to be local varieties; they are not known.‖—*Poire.*—1, Beauty of Kent; 2, 4, 6, Dumelow's Seedling; 8, Easter Pippin; 9, New Rock Pippin; 10, Norfolk Beaufin; 11, Blenheim Pippin; 12, Royal Russet. 1, Passe Colmar; 2, Glout Morceau.‖—*A. B.*—1, Moor-fowl Egg; 2, 3, Chaumontel; 4, Swan's Egg; 3, Margil; 4, Dumelow's Seedling; 6, Norfolk Beaufin; 7, Golden Reinette; 8, Scarlet Nonpareil; 9, Easter Pippin.‖—*G. B.*—Flemish Beauty; Blue Frontignan.‖—*W. D.*—1, Seckel; 2, Winter Nelis; 3, Passe Colmar; 4, Glout Morceau; 5, Marie Louise; No Nos., Crassane; Black Worcester. 1, Dutch Mignonne; 2, Hollandbury; 7, Golden Harvey; Waltham Abbey Seedling; Scarlet Nonpareil.‖—*W. M.*—Uvedale's St. Germain, only fit for culinary purposes.‖—*Lanelay.*—1, Stone Pippin; 2, appears to be Salopian; 3, Kerry Pippin; 4, Scarlet Crofton; 5, Downton; 6, Sops of Wine; 9, Carlisle Codlin; 10, D'Amande; 11, Bishop's Thumb; 12, White Doyenné.‖—*An Old Subscriber.*—1, Beurré Rance; 2, Beurré Diel; 3, Urbaniste; 4, Beurré d'Aremberg; 5, White Doyenné; 6, Marie Louise; 7, Yorkshire Greening.‖ *M. W. K.*—Worthless.‖—*A Constant Subscriber, Parsonstown.*—Chaumontel.‖—*J. M.*—Blenheim Pippin.‖—*T. W. O.*—Your seedling Apple cannot be distinguished from the Gravenstein.‖

Names of Plants.—*F. H. S.*—1, Pinus taurica; 2, P. hispanica.¶—*S. W.*—Alsine stricta is described in Wahlenberg's "Flora Lapponica," p. 27; it is the Spergula stricta of Swartz, and the Arenaria uliginosa of Gaudin. Alsine is now made up of Arenarias and other things, in addition to some of the old Alsines. By Carduus setosus is probably meant Cirsium setosum of Bieberstein, also called Cnicus setosus and Cirsium dioicum. Mr. Babington has given the locality correctly.—*Col. H.*—Fuchsia cordifolia, and *apparently* Justicia carnea.—*F. J. X.*—The tree Violet: it will grow six or nine inches high with a woody stem; we agree with you that it is a very nice winter thing. Cuscuta yerrucosa; would you give us a plant, addressed to 21, Regent-street.—*C. C.*—There is a difference of opinion as to whether Brugmansia candida or Datura arborea is the more correct name. The latter is good enough for us. We cannot undertake to name plants without flowers.—*A Subscriber.*—New plants *cannot* be named without flowers. 1 is *perhaps* a Mathewsia; 2 and 3 are alike, and *perhaps* a Cynanchum.—*R. Clair.*—It is impossible to name plants from single leaves, and especially seedlings, which are apt to vary. Send flowers and leaves both, and then we may be able to answer you.‖

Pansies.—*H. B.*—We have marked the following 50 varieties from your list: King's Sulphurea elegans, Brown's Countess of Orkney, Curion, Maid of the Mill, Pearson's Black Prince, Cook's Mulberry Superb, Triumph, St. Paul's, Thompson's Nymph, Raphael, Cyclops, Attila, Regulator, Eclipse, Miss Stainforth, Corona, Jehu, Ultraflora, Desirable, Queen Dowager, Olympia, Grand Duke, Rufus, Launcelot, Duchess of Richmond, Beauty of Bucks, Azurea, Chevalier, King of Beauties, Vivid, Warrior, Prince Albert, Delicata, Kitley's Bathonia, Major's Bridegroom, King's Exquisite, Princess Royal, Champion, Sovereign, and Alert; Lane's Sir J. Seabright, Lidyard's Jewess, Maule's Prince of Wales, Gaines's Tippoo Saib, Lady Flora Hastings, Davies's Miss Nugent, Foster's Man of Kent, Hooper's Rival Yellow, May's Imogene.*

Pelargoniums.—*J. G. R.*—Retain Nos. 1, 2, 3, 8, 11, 20, 21, 22, 23, 24, 26, 27, 31, 34, 35, 43, 45, 48, 49. Add to your collection the following sorts: Sultana, Matilda, Luna, Pulchellum, Oberon, Sir R. Peel, Symmetry, Hodge's Commodore, Nestor, Priory Queen, Arminta, Cleopatra.*

Pine-apples.—*A Constant Reader's* remarks on Mr. Mills's mode of growing them are premature. It will be better to wait till he has published his own account of his method, which is announced. Carping at cultivators more successful than yourself is not to be approved of.

Planting.—*Anon.*—Trench deep, give a little manure if you can, and plant now, making use of Oaks from 1½ to 2 feet in height. They will soon beat larger plants. The sessile-fruited Oak will grow faster than the common Oak by one-third, and is at least as valuable as timber, besides being much handsomer.—*J. W.*—The Highland Pine has the reputation of being superior to the Scotch Fir, and, as we believe, justly. It is a variety of Pinus sylvestris. We should use it if we had any planting in hand. We do not know Smith's book on forest trees. The best is Mr. Selby's work on that subject.—*A. B. C.*—We cannot advise you to attempt to transplant your old Yew-hedge suddenly. The chances are too much against you. If you will, this autumn, dig a trench 18 inches deep along each side of it, 2 feet from the stems, and fill the earth in again, you will compel the plants to form new roots, and you may then transplant them safely next November. In the mean while cut away the Laurels, and take out the dead wood, exposing the naked part to the light, and you will probably get some green shoots to form during the ensuing summer.

Roses.—*Clericus.*—The following are 12 good standard Roses, viz, Triomphe de Plantier, Queen of Bourbons, Acidalie, Proserpine, Archduke Charles, Comte de Paris, Duchess of Sutherland, Bouquet de Flore, Crimson Madame Desprez, Madame Hardy, Beauty of Billiard, and Charles Duval.—*A Subscriber.*—The following are good sorts for growing in pots, and have been shown at the Chiswick and other Exhibitions near London this year, viz., Elise Sauvage, Fabvier, Mirabile, Duc d'Aumale, Princess de Mecklenberg, Cramoisie supérieure, Diana Vernon, Proserpine, General Allard, Devoniensis, Celimene, Charles Duval, Napoleon, and Triomphe de Luxembourg.‡

Tobacco.—*A. S.*—Porter's "Tropical Agriculturist." You will find some useful remarks in the *Gardeners' Chronicle*, p. 624.]

Vineries.—*A Two Years' Subscriber* should in the first place pull down his flues. Now, as the mischief has happened, nothing can be done except to keep the house quite dry, and to prune well back, when the proper season arrives.

Vines.—*Revertens.*—Vines may be pruned when their leaves turn yellow, although they have not dropped. Whilst the leaves are green they will return elaborated juices to the stem, although they may not be exposed to the direct rays of the sun; light, however, is necessary. You had best root a layer, then plant at some distance from the wall, layering the shoot towards the latter. It is proper to pave Vine-borders 2½ feet below the surface. For a greenhouse, add the Royal Muscadine to those you mention.‖

Welch Onion.—*Z.*—Those intended for seed should be transplanted early in spring.‖

Whitney's Composition.—*J. H. J.*—We have no personal experience; but everybody complains of its rotting the linen—an objection that has not been answered. Under these circumstances you had better pause before you take it as a substitute for glass in permanent buildings.

Miscellaneous.—*J. L.*—Cuttings of Pelargoniums, if put thickly into pots or pans, and kept in any sort of cold pit or frame that is quite secure from frost and damp, will root between this and spring. Tan, if old, will be of little use, and if new, it will raise too much heat and moisture for Pelargoniums. Tan, even ever so old and rotten, is very injurious to ground, and mixed with lime or hot dung, it causes Fungi to grow for years afterwards in the place where it was applied; the only way to use old tan with safety is to convert it into charcoal. Apply salt to Asparagus in spring.¶—*A Stirlingshire Subscriber.*—There is nothing uncommon in the way in which you prepare your Cucumber-beds; and your success is no doubt owing to good management.‡—*R. H. C.*—Mr. Glendinning, Nurseryman, Turnham Green.—*Flora.*—Calico will not do as a substitute for glass; it is very nice and transparent, but it rots in a season. See a letter in another column.—*Frutex.*—Steeps for seeds appear to be useless. New Holland seeds should be sown in February on a gentle hot-bed, and afterwards treated as greenhouse plants. They are very easily raised. If any of them are Acacias soak them in boiling water for *one* minute, just before sowing them.—*Rusticus.*—We will attend to your suggestion.—*A Beginner.*—The fur you complain of is some saline efflorescence, and is either caused by something in the pot itself or the mould; it is not in our power to say which. Let your seedling Geraniums winter where they are, and shift them as soon as they seem about to grow in the ensuing spring.—*John o'Groat.*—Much obliged; but we cannot insert statements made by persons whose names are not given us confidentially.—*H. G.*—In the treatment of your Gladioli follow the directions given by Mr. Paxton at p. 231 of this year.‡

SEEDLING FLOWERS.

Fuchsias.—*J. L.*—3 blooms of a large, stout, and showy Fuchsia; this is one of the largest of the light varieties we have seen; the tube and sepals are rather coarse, and contain a little too much colour, as the corolla is light, though of a beautiful crimson.*

*** As usual many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

Erratum.—In Mr. Miller's Advertisement of last week, for "Common Firs in pots," read "Common Furze."

FARM.—Wanted to Purchase, A FARM of 200*l.* to 400*l.* a year rental: it must be south of the river Thames.—Address, by letter, stating size, situation, rental, and price, to E., *Gardeners' Chronicle* Office, 5, Upper Wellington-street, Covent-garden, London.

TO COLONISTS, EMIGRANTS, &c. — Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil cake Crushers	Threshing Machines for the
Double action Turnip cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps.

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch-street, London.

The Agricultural Gazette.

SATURDAY, NOVEMBER 2, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Nov. 6—Agricultural Society of England.
THURSDAY, Nov. 7—Agricultural Imp. Soc. of Ireland.

WEDNESDAY, Nov. 13—Agricultural Society of England.
THURSDAY, Nov. 14—Agricultural Imp. Soc. of Ireland.

MUCH as England owes of her prosperity to her mineral wealth, the value of her SUBTERRANEAN AGRICULTURAL RESOURCES far exceeds it. The means which these afford of increasing the fertility of the surface, and of furnishing profitable employment for the agricultural labourer, have hitherto been too much neglected. Widely as the geologist knows these to be distributed, and highly as he appreciates them, he sees agricultural practice availing itself of them only here and there. Wherever this is done, the result is such as to confirm his conviction of the advantages to be derived from their more extensive development; but in these operations the same want of system and of guidance by general principles is observable, which pervades everything connected with agricultural practice.

Perhaps few parts of the geological series furnish a better illustration of their value than the rocks of the cretaceous system. Our geological maps afford a very inadequate notion of the extent to which these rocks are applicable to the improvement of the surface. They exhibit only the stratified or unstratified rock which in each locality is nearest to the surface, disregarding, and supposing to be wholly removed, that loose covering (the detrital deposits of the northern drift) which is of the greatest importance to the agriculturist, and often of great thickness. We see laid down on these maps a main ridge of chalk hills, extending in a north-east direction from the southern part of Dorsetshire to the coast of Yorkshire, and sending off two branches, which, under the name of the North and South Downs, stretch eastward to the Isle of Thanet and Beachy Head. But the agricultural influence of the chalk, or the influence which it is capable of exercising, extends far beyond these limits. Through all that triangular space bounded on the west by the curved line extending from Beaminster to Flamborough Head, and on the east and south by the German Ocean and the English Channel, the chalk, where it does not rise to the surface, constitutes (with an exception which will be noticed presently) the substratum, and is covered by sands, gravels, and clays of later formation. From the rise of the strata towards the west, the beds of the gault and greensand, which constitute the lower members of the cretaceous series, emerge from beneath the chalk on the western side of the main line of chalk hills, and form a narrow parallel band of argillaceous and arenaceous strata at their base. The excepted area within which the chalk does not form the substratum is the district of the Weald of Kent, Sussex, and Surrey. There, a movement of elevation, having an east and west direction, has broken up the cretaceous rocks, and brought to the surface the beds of clay and sand below them. The latter occupy the centre of the Weald of Kent denudation; the former flanks this central ridge in two parallel bands, between which and the North and South Downs the gault and the greensand occupy the same relative position at the base of those hills which they occupy at the base of the western line of chalk hills. These ranges of chalk hills are anything but fertile. Large portions of them are in the state of sheep-walk—the calcareous rock being covered by only a few inches of light vegetable mould, which supports a short though sweet herbage; and the crops produced on the arable portions are raised at the expense of these downs, by means of the sheep fed on them in the day and folded on the fallows at night. The purer sand and clay strata of the lower greensand, Hastings' sand, and Weald clay, afford likewise unproductive soils, little prized by the farmer. The gault consists of a mixture of clay and calcareous matter, highly productive, but, from its tenacity, difficult to work; while in portions of the upper greensand the addition of a large admixture of siliceous matter to these two earths produces a deep rich friable loam, capable of growing every description of crop. We are thus taught by Nature how a fertile soil is produced by the mixture of earths which, in their separate state, are sterile: and we learn how all the unproductive portions of the sand, clay, and gravel within the great triangular area before mentioned are capable of improvement by the application of chalk and clay. Within this area the chalk is much used, and we may add abused, as a manure in the form of lime. In its unburned state it has long been employed with great success in a few districts of limited extent. To the sands, gravels, and light loams of Norfolk, under the name of "marl" and "clay," it imparts tenacity and calcareous matter. The "marl" is the solid chalk, the "clay" is the transported fragmentary chalk mixed with a variable proportion of clay or loam. Both are generally found at moderate depths beneath the surface of the land to which they are applied. To those parts of the district where the covering is too deep to enable the farmer to avail himself of them, they are conveyed by water from pits on the banks of the navigable rivers. A cubic yard of *rincallon*, as the overlying sand and gravel is called, is frequently removed in order to obtain a cubic yard of chalk or chalk rubble. In the "marl" pit of a farmer we have seen the chalk covered by sand and gravel 13 feet deep, and worked to no greater depth, though it was stated by him that the quality improved with the depth. In the lime-works near Norwich, the covering is 40 to 60 feet deep, the depth to which the chalk is worked not more than 60 feet. From the numerous pipes which penetrate the chalk, a very large proportion of it is too much weathered, and too much mixed with the sand and clay which fill these pipes, to be burned for lime, and is put into barges for the use of farmers at a distance. The chalk of Kent is applied to the London clay of the Isle of Sheppy, which it improves mechanically, by rendering the soil more friable, and chemically, by imparting calcareous matter with probably a small portion of phosphoric acid, and by neutralising, with formation of sulphate of lime, the injurious salts of iron which that clay contains, and which results from the decomposition of the iron pyrites so abundant in it. On other portions of the London clay, constituting the surface of parts of Essex and Suffolk, the farmers have long and extensively used for the same purpose the chalk of Kent, conveyed to them by water. All this shows over how extensive a tract of country chalk is usefully employed in improving clay soils.

We shall next week inquire into the practical details of the process.—*E. W.*

DURING the past week we have been busily engaged in HARVESTING OUR CARROT AND MANGOLD-WURZEL CROPS. The plan we have adopted is that which was shortly described in a late Number of this Paper. It fulfils the three conditions of success in the preservation of root crops through the winter—it furnishes security from the frost and the wet, and at the same time provides for a sufficient ventilation of the heaps.

The harvesting of root-crops is best done by piece-work. The harvesting of a good crop of Carrots has hitherto cost us from 17*s.* to 25*s.* per acre—that of Swedes and Mangold-Wurzel, from 6*s.* to 10*s.* For this sum the contractor pulls the roots, cuts off the leaves, fills the roots into carts, and gathers and loads the leaves also.

In the operation of harvesting Carrots the spade is required—it is pressed into the ground, and used as a lever by the right hand, while, by the left, the root is pulled up. Each man lifts two rows as he proceeds, and four men forming a company, eight rows are thus pulled and laid regularly on the ground in two lines. Two women can top the roots—*i. e.* cut the leaves off them—as fast as this number of men can pull them; and, leaving the roots in a central row, they throw the leaves into two lateral ones as they proceed. The carts, the number of which, varying according to the distance from the heaps, must be such as will convey the roots off the land as fast as they are ready, follow close upon the cutters; a man and a boy will be able, under ordinary circumstances, to fill both roots and leaves into them as fast as those already mentioned can prepare them; and another man and boy will be able to pile the roots up in the heaps, and thatch and finish them off as they proceed. We mention all these details, because it is all-important to the speed and economy of the operation that the forces employed in the different parts of it should be rightly proportioned to each other.

The leaves, if, as in ordinary seasons would now be the case, they be already withered, may either be left on the ground and ploughed under, or, as on land already rich enough for grain crops, they may be carried away to the fold-yard and trod down by the cattle. When, as in the present late season, they are still green, they may be used as fodder. As long as leaves are green they remain useful in the growth of the plant. The only reason why we are now harvesting our Carrot crop, before the roots have stopped growing, is their extreme sensitiveness to frost. This is so great, that it is of the greatest importance to secure before night all the roots pulled during each day—if they get frozen, though it be merely on the surface, it will be almost impossible to preserve them through the winter.

We have but one more remark to make, and that is on the fact that rottenness, when it is owing to any external cause, always commences at any cut or bruised portion of the surface. It thus becomes of importance that the surface of the roots should be cut or abraded as little as possible. The root fibres should not be cut off at all, and the leaves should be cut off so far from the crown of the root, as that they may fall separated from one another. So far as our experience has hitherto gone, if these points be carefully attended to, and if such a plan of harvesting be adopted as fulfils the three requisites of success before alluded to, there is but little risk of the farmer losing much of his crop by heating or putrefaction before the spring.

THE ANOMALIES OF AGRICULTURE.

CHAPTER II.

COULD the life of an individual, retaining his full powers of perception and reflection, be extended very considerably beyond its ordinary span, so that he might have an opportunity of beholding the phases and revolutions of human advancement, apart from those personal interests and connections with the world around us, which make its moral growth and progress too co-ordinate with our own, to strike the optic nerve of the mind with their full vividness, it may well be conceived, judging only from the history of the last century, that one of his most striking observations would be this strange paradox—that most of the fundamental and wholesale improvements in the various arts of life, are suggested, produced, perfected, *from without*; resisted, deprecated, obstructed, *from within*. It is a fact not very complimentary to the human mind; but it is not the less true for that. Whether it be that in each profession there is a sense of self-interest (and *that* will resist even mathematical demonstration) mistakenly imagined to be indissolubly bound up with the perpetuation of existing practice—or whether from the mere *vis inertiæ* of early habit, the mind shrinks from the contemplation of a change, and detests the propounder of it—or whether it be partly from both of these, and perhaps other motives combined; yet certain it is that the inventors and improvers in each art have in almost every instance met with the most virulent opposition to their theories, at the hands of its existing professors. An almost ludicrous instance of this occurred only a few years ago, in the remembrance of all, when first it was proposed, in defiance of the thunder of an army of coach-proprietors, and a navy of canal shareholders, to carry on the traffic of the "human form divine," and other perishable goods, by means of railroads instead of stage-coaches; and scientific writers, with singular simplicity, undertook to comfort the alarmed professors of the art of conveyance, by the assurance that it would prove a national benefit, and that the same outcry had been heard and adjudicated upon before, in *their* favour, when *their* speed eclipsed the previous rate of locomotion. Upon the same principle the ingenious Lord Stanhope moved the smiles and jeers of his cotemporaries in general—but the then naval officers and Lords of the Admiralty in particular—by the insane proposition that a steam-boiler and apparatus might be stowed on board ship, to propel it by means of paddles, even against wind and tide! And the remarkable feature in the case of that item in the modern "army of martyrs" was, that in the general derision, the most solemn and deliberate verdict which assailed him was that of these "experienced naval officers"—men of advanced practice and professional education—men who, in delivering their opinion, would preliminarise with a deprecation that mere attachment to habit and usage should be thought to warp or influence *their* decision—but that really his Lordship's idea and proposition was one of that class that they were bound, after the most patient professional investigation, to pronounce impracticable and preposterous! But Science, like all Truth, is Eternal; and eventually, in that slow but certain defeat which Prejudice, with "sentence of death written upon its brow," * suffers at the hand of Time, is forced—by a sort of popular clamour siding at last with reformations obvious to all but the self-interested; yes, forced upon the profession whose real interest it is, and whose subject-matter it mainly concerns. Yet, not in one generation is the Victory often accomplished; for Prejudice will sooner die than yield; and it does die: and thus the laconic writer, who blurted out the queer exclamation, "Thank God, old men must die," was not far off the enunciation of a great truth; namely, that it is by the mortality, rather than the candour or conviction of generations, that improvements and revolutions in practice are accomplished.

It is difficult to resist this train of reflection, when one reads, and oftener hears, the contemptuous language of some of those who call themselves Farmers of the "good old fashioned school," in reference to those whom they are pleased to class as "march-of-intellect gentlemen," advocates of Guano and Gypsum, fixers of Ammonia, constructors of Liquid-Manure Tanks, who want to turn a jolly Farmer into a "Chemist and Druggist!" This latter expression, in particular, which wound up a

* T. Carlyle's Hist. of the French Revolution.

perfect *tour-de-force* of after-dinner oratory at a recent farmers' meeting, is worth preserving as a relic, indicating the sort of idea entertained by speakers and thinkers of that calibre, of the use of Chemistry to Agriculture. That they have been applying, and do apply its powers and results, in some of their most miraculous and complicated forms, almost every day of their lives, upon their fields and upon their stock, would probably be as startling a piece of information to them as the announcement that he had been "talking prose" all his life was to the Squire of Barton, or the news of the Waterloo Victory to the Warwickshire man who, when the bells rang the merry tidings that peace was proclaimed, asked, "What! have we *been a-warring* then?"

Nothing indeed, to speak but too generally, can be conceived more absurd than the ordinary estimation in which, respectively with its actual rank and importance, Chemistry has been held among the sciences. To this hour a vast and respectable portion of the community are only aware of its existence, so to speak, as a sort of Apothecary's lore—the "Doctor's Assistant"—a kind of subservient pestle-and-mortar affair, over which the magi of the sickroom and hospital wield a cabalistic power, by the aid of certain hieroglyphic signs and symbols scratched with the stump of an execrable pen upon a magic quarter-sheet of paper; a thing of bottles and pill-boxes, hiding their conscious hideousness behind pharisaic rows of enormous glass globes of many-coloured liquids glistening in the blaze of shop gas-lamps! There is a story told of a tribe of American Indians in days long past, who had treated with incredulity and contempt the representations of some English wanderers who had settled amongst them, of the national importance and naval skill of their countrymen. All assurance and explanation were vain, until by chance a British seventy-four happened to anchor off the coast. The natives came from far and near to see it, and some of the chiefs were permitted to go on deck: the stupendous mass of masts and rigging, deck upon deck bristling with guns, mountains of cordage, hundreds of men—through all that there is to see of that

"Sight to dream of, not to tell!"

they were led, speechless with awe. They returned in silence, overwhelmed and downcast, to their homes, and never were heard again to speak upon the subject.

Now, if by some miraculous process of intuition, the great body of those who call themselves Farmers could be gifted with an instantaneous and complete perception of the whole powers of Nature comprehended under that word Chemistry—the natural history of all created substances—of everything cognisable by the physical senses of man, and the laws which govern their infinite unions and variety, co-extensive with matter, *perhaps with space itself!*—could they be shown at one comprehensive glance, what it has done for the other arts of life, and its too long neglected importance and specific applicability to theirs—good Heavens! what would they think of their former—their now-existing pretensions and aptitude, as Professors of the art of Cultivation! Would they wonder much at the startling paradox which has lately been quoted from mouth to mouth—"That of all members of the community the Farmers, taken as a class, are the least acquainted with the true meaning of the word *Agriculture*." And why? Because, of all pursuits, Agriculture is the one which calls into use the most extensive acquaintance with Nature, and consequently the widest range of physical Science: and of all members of the community Farmers have hitherto had, generally speaking, the least advantage of an education comprising such studies, and therefore adapted to the true exigencies of their future occupation. It is said that a person applying to the late Lord Leicester for a vacant Farm, said in answer to a question put to him, that he had "followed the Plough ever since he was a boy, so he ought to know something about farming." "About *ploughing* you mean!" replied the veteran Agriculturist; "the best Farmer I ever knew was a retired Tallow Chandler!" The philosophy of this answer seems borne out by Middleton in his "View of the Agriculture of Middlesex," where he says, alluding to the renegades from other professions to that of the Farmer: "This class forms the most intelligent and accurate of husbandmen. Like converts in religion, they have more zeal, give more application, in short, have fewer prejudices to surmount, and more enthusiasm for their new profession, than those who have been brought up in it from their infancy. They are at the first outset liable to error and mistake from want of practice, but their indefatigable attention makes more than amends for their ignorance of minutiæ; and as they have been at some pains to acquire a knowledge in the Theory of Agriculture, and hence established their ideas on rational principles, they most commonly in the end make a distinguished appearance, as their labours, if judiciously performed, though often in a new and experimental channel, seldom fail of being crowned with success." A remarkable instance of the truth of this occurred in the recent remembrance of a few of our readers in the West of England. A gentleman whose early life had been devoted to a very general flirtation with the Sciences took to Farming. On an inquiry being made, about a year afterwards, of a neighbouring land-steward (himself a well-known judge of stock), how this gentleman got on with his farm, the answer was—"Oh! dear—all the Farmers round laugh at him: he *goes into a field, and digging up a bit of the under soil, pours something upon it, out of a phial he carries in his pocket*—if it phizzes he says to his Bailiff, 'You need not put any lime to it this turn;' and if it doesn't, he gives some other order about it!" Four years had passed away before another opportunity occurred to the same party, of asking after him. "By the way, how does Mr. —— get on with his farm?" "Why, bless you, Sir!" was the answer, "he's the best Farmer in the whole county! his crops beat anything that ever was seen or heard of, upon that land." Now, here was a man, the better half of whose life had been spent in mere theoretical study and amusements; a good geologist, it is true, and an excellent chemist; indeed, of a mind as acute, as it was devoted to science in general; and what was perhaps better than all, of a singularly persevering temperament; he takes the plough in hand between the age of 30 and 40, and in four or five years is "the best farmer in the county." Can anything prove more strongly than this—not that a man is necessarily the better farmer for beginning late in life, *but* that an education is at least as essential for attaining anything like perfection in Agriculture, as in any other of the laboriously pre-studied pursuits of human industry? and that the mind must be early directed to the investigation of the great truths of Nature, and to a course of experimental acquaintance with them when practically applied, "equally at home," in fact, "in the closet and the field" (as they say of another sort of generalship), if ever it would attain to that rapid and almost innate-seeming perception of effects, and adaptation of causes, without which, every operation of mind upon matter must be mere empirical drudgery and chance-work.—*C. W. H.*

(To be continued.)

THE PLOUGH.

There are, I conceive, but two questions of any moment connected with the construction of the plough. One of them is, What form of the plough will insure the attainment of those effects which are or should be the object of ploughing? and the other is, What form of the plough will insure the accomplishment of these effects with least exertion of force? These questions about the plough refer, one of them, to the nature and the other to the expense of its operation.

There is no difficulty in determining which of these comes first to be considered. We must, in considering a machine, evidently first ascertain whether it answers the purpose for which it was intended, and then as a subordinate consideration, inquire into the expense of its working; and this view of the subject has, I think, been too much neglected with regard to the plough. True economy most certainly advises the farmer to have his work well done though it be attended by additional expense.

Before attempting to answer the question which thus comes first for our consideration, we must ascertain what those effects are which it should be the object of ploughing to accomplish. The farmer ploughs his land before winter, in order that the frost may exert its influence to advantage in mellowing the soil, and in leaving it when spring arrives in a loose and friable state. He ploughs it also repeatedly before seed-time, either in spring or autumn, in order to loosen and pulverise it, and thus form a good seed-bed. He also ploughs it repeatedly during a lengthened fallow—his object being in all these cases the same, viz. to expose a fresh surface, and leave the land loose in order to be acted on by the weather. Land is also sometimes ploughed to assist the extirpation of weeds, either by burying them or by loosening the soil, and so letting them be more easily dragged to the surface; and it is also sometimes ploughed in order to cover manure or other matters spread upon its surface.

I need not state here the condition in which land ought to be left by the plough, either when it is intended for a seed-bed, or that it may be most rapidly prepared for one. Both the farmer and the philosopher agree on this point; the latter having the advantage only of knowing *why* such a condition is a good one.

Whether the question be looked at by the eye of the practical, or that of the scientific man, the answer given by each is the same in fact, however different the phraseology may be in which it is expressed. The one says that land should be in sound heart and healthy condition, and the other means the very same when he says that it should be in such a state that free access be given to air and moisture, by which the manure in the soil may be rapidly decomposed, or the germination of the seed rapidly effected.—*M. S.*

ON MINERAL AND INORGANIC MANURES.

No. XXVIII.

By Professor Charles Sprengel.

If peat-ashes contain very little gypsum, common salt, phosphate of lime, and, generally speaking, little of those substances which are amongst the chief nutriments of plants, they have (as a matter of course) little value as manures, which is still less the case the more phosphate of iron they contain. I have analysed several sorts of peat-ashes, which were almost useless, and will state a few of the results, for the sake of proving my assertion.

1. *Peat-ashes from Lünebury* (reddish). 100,000 parts consisted of—

43,300	parts	of silica.
9,700	,,	alumina.
19,300	,,	oxide of iron, and a little protoxide of iron, partly combined with phosphoric acid.
3,500	,,	oxide of manganese.
7,100	,,	lime.
4,600	,,	magnesia.
0,160	,,	phosphate of lime.
0,100	,,	common salt.
0,200	,,	gypsum.
12,040	,,	carbonic acid, combined with lime and magnesia.
100,000	parts.	

If even 3000 lbs. of these ashes are brought on one acre, the soil will only receive 6 lbs. of gypsum, 3 lbs. of common salt, and 4½ lbs. phosphate of lime, so that only the lime and magnesia (350 lbs.) may expect to produce some effect. The great amount of phosphate of iron (580 lbs.) might, on the contrary, prove hurtful to the plants.

2. *Peat-ashes from Brunswick* (blood-red). 100,000 parts consist of—

48,300	parts	of silica.
4,160	,,	alumina.
29,090	,,	oxide and protoxide of iron, partly combined with phosphoric acid.
0,480	,,	oxide of manganese.
16,100	,,	gypsum.
1,810	,,	sulphate of magnesia.
0,060	,,	common salt.
100,000	parts.	

Although these ashes contain much gypsum, and might thus be expected to be useful, this is by no means the case, because what is effected in one way by the gypsum, is spoiled on the other hand by the phosphate of iron, and perhaps also the sulphate of magnesia. Large quantities can never be used, and if 500 lbs. were to be put on the Magdeburg acre, the soil would receive thereby as much gypsum as is ever used of this substance by itself.

Very often peat-ashes are mixed with burnt lime previous to being used, the effects of which have always been beneficial. With 1000 lbs. of ashes, an equal amount of lime is mixed, and conveyed on one acre of land. There is no doubt that the lime decomposes (in lying in a wet state with the ashes in a heap) the phosphate of iron, and thereby essentially improves the ashes. It might therefore be possible that even the worst ashes, viz., such as possess much phosphate of iron, could be improved by being mixed with lime; which deserves to be experimented upon. Even if it were to contain much sulphate of iron, it would be improved by the adding of lime, as this substance, although it is a good manure, still easily injures the plants.

In Belgium, peat-ashes, previous to being used, are often mixed with cloacine, whereby the latter are always improved. There it is also asserted that peat-ashes will improve by lying some time in the air, protected from rain. Such ashes most probably contain much sulphuret of calcium, which, as it is more easily soluble in water than gypsum, might supply the plants with too much sulphur; but exposed to air, it changes gradually into gypsum, which is less soluble. In small quantities, however, this substance is not hurtful; on the contrary, it is then a useful vegetable food.

In some places (for instance, the county of Diepholz, in Hanover), sandy loams are improved by peat ashes in the following way:—The offal of peat, but especially the black soil, which lies above the peat of the high moors, and which has been generated by the decomposition of the peats there growing, is strewed 1½ inch thick over the fields, and then worked in dry weather with harrows, till it is dry, when it is burnt with straw, proceeding against the wind. The fire will soon extend over the whole surface, and the peat be converted into ashes; these are now ploughed under shallow as soon as possible, the field is harrowed and sown (after being once more ploughed somewhat deeper) with Rye, which will grow exceedingly well after this operation. This is easily to be explained, by considering that the ashes will not only manure the soil, but the heat also kills all seeds of weeds, and the insects and worms; acting, moreover, beneficially upon the humus, and the protoxide of iron of the soil decomposing the former, and disposing the latter to be converted into an oxide. If, on the other hand, the peat-ashes contain protoxide of iron, ammonia will be generated by the decomposition of water, and the result will be still greater. It has been just stated, that for this operation the black soil lying above the mossy peats of the high moor is used, as we have seen that it will greatly improve the growth of crops. This again proves what important parts certain mineral substances perform in the nourishing of plants, as the chemical analysis of the black soil has shown to me, that it is rich in phosphate of lime, gypsum, common salt, magnesia, carbonate of lime, and potash; whilst the ashes of the Moss-peat lying under the former, contains but very little of these substances, and no potash at all. It is also to be observed that the substances of peat must be entirely converted into ashes; because if they are ploughed under in a state of imperfect combustion the field will be impaired. For the sake of making sure that the whole has been converted into ashes, the burning must not be resorted to until it is perfectly dry, which will be best done in the hot season (July, August). It is also good, for the sake of the surer communication of the fire, to mix the earth with a little Moss-peat, as the latter is very inflammable. The best result of this operation will be found on calcareous soils; in fact, it is followed by results so extraordinary, that it ought to be resorted to wherever practicable.

The most general use of manuring with peat-ashes is made in the cultivation of high moors; nay, it is here indispensable to burn a great part of the peaty substance, in order that the soil may be planted, as by the burning not only the superfluous amount of humus is destroyed, which (as we have seen before), injures vegetation by depriving it of the necessary oxygen, but the plants are supplied with the required mineral substances. At present not only arable fields but also meadows are manured most advantageously with peat ashes. It is in Holland where they are most employed for that purpose,

and many meadows not subjected to inundations, are strewed over twice a year with a good quantity of peat ashes; the first time in March or April, the second time after the first cutting of the Grass. Every time 3000 or 4000 lbs. per acre are used, which is continued for three years, and the harvest of Grass is afterwards twice what it has been before. Afterwards the meadows are at times broken up, and planted the first year with Flax, which is followed by Oats, amongst which Clover and Grasses are sown; and the field then rests as a pasture.

If peat-ashes are used in manuring fields, they are harrowed in with the seed or ploughed in shallow. Clover and Lucerne fields are strewed over with them in the spring. The duration of their action cannot be stated with accuracy, as it depends both on their quantity and their chemical constituents.

He who has much peat may burn it, for the sake of obtaining large masses of ashes, in high cylindrical ovens built on purpose and furnished with a grate. This has the advantage that the fresh wet peat can be thrown on that already burning. It would be very advantageous to deprive the newly dug out peat, by a press, of most of its water. The burning of peat is also done in large heaps; in which case, however, it must be already dry. Care is always to be taken that the heat be not too great, else the ashes will lose much of their value; silicates will be formed, which (as we know already) are of no use to the plants. It is obvious that only such peat is to be burnt as experience or chemical analysis has proved to yield a useful sort of ashes.

ON DIBBLING WHEAT.

I HAVE read with much pleasure the remarks of your correspondents, "T. B. Pearson," "A Constant Reader," and the Report from Stow-in-the-Wold, of the superiority of *dibbling* over *drilling* Wheat.

In the autumn of 1836 I dibbled 3½ lbs. of chevalier ten-rowed white Wheat, one corn in each hole only, in rows 6 inches by 12, which covered 64 perches of land; the produce was 16 bushels. I lost a great many ears, in consequence of the field being bordered by the public road: persons passing took the liberty of gathering them, out of curiosity, such sort of Wheat not having been cultivated in the neighbourhood; but still every ounce of seed produced 13 lbs. 3 oz. This was made public through the pages of the *Reading Mercury*, and recently by Mr. J. Brown, in his Address to Wheat-growers and Agricultural Societies.* In February, 1842, I sent the inclosed letter to the editor of the *Mark Lane Express*, the republication of which might be productive of good. I have had much better crops since I have dibbled 4 inches by 9. As your "Constant Reader" calls upon some of your mechanical readers to invent a dibble, I send you an outline of one which I have used for the last six years: it is a very simple instrument, and the dibbles being of cast iron screwed into the cross-piece, after a little use they clean themselves well, unless the land is wet and adhesive. I think it would be complicated, if the dibbles were made to turn half round.

Handle, 1 foot long; stem, 2 feet 6 inches, morticed through the cross-piece, as well as the handle; cross piece, 20 in. long, 3 in. wide, and 1½ in. thick; dibbles, 1½ in. diam. at the shoulder of the screw, and 3¾ in. long from the shoulder. The hole made is hardly ever more than 3 in. deep, on account of the soil tumbling in when the dibble is removed.

However, I beg to call the attention of your "Constant Reader" to the advertisement in your columns, of "Smith's Field and Garden Seed Dibble, or Hand Machine," made by and to be had of Messrs. Cottam and Hallen, No. 2, Winsley-street, Oxford-street. I have not yet seen the machine, but have read a book descriptive of it. I have such an opinion of its usefulness and simplicity of arrangement, that I have no doubt but it will be in general use when known. It is a tube of copper or tin, somewhat of this shape; the hole for the seed is made by pressing down the cross handles, and the seed deposited at the same time, in any number the operator wishes; it can be adapted to Turnip and Mangold Wurzel-seeds, Wheat, Barley, Peas, and all kinds of garden seeds. It is now in great request.—*W. Bartlett, Surgeon, Marlborough.*

The following is Mr. Bartlett's letter, alluded to above:—"Having seen in a number of the 'Farmers' Magazine' for June, 1841, some remarks on the subject of dibbling Wheat, by Mr. W. Lucas, wherein it is stated that the greater the number of Corns dropped into each hole, the less was the produce; that one grain invariably produced more than two; two more than three; three more than four, up to eight, which number seldom produced more than one stalk or ear, and that of an inferior quality; and having had some experience in dibbling one Corn in a hole, I can vouch for the truth of this statement; the average from one grain is from 12 to 15 ears. I have specimens by me of 84 stalks of Barley, and 55 of Wheat, each from one grain—each stalk producing a perfect ear. As I occupy but a small quantity of land, I am anxious to make the most of it; and the system I have hitherto pursued is spade husbandry and artificial manures. In 1840 I dibbled 108 poles of land with 7 gallons of Beans, making the holes 4 inches apart and the rows 18 inches asunder, dropping one Bean in each hole; immediately the Beans were planted and covered in, the land was manured with one sack of good salt; the produce when threshed was ten sacks, one and half a bushel of Berkshire Ticks, of a superior quality, not having any refuse whatever; each Bean produced three stalks nearly 7 feet high; whilst growing they were declared to be the finest sample ever seen in the neighbourhood.

"After a good crop of Potatoes in 1840, which were manured with gypsum when the stalks were about 6 inches high—a manure not beneficial to cereal crops, consequently not likely to influence the quantity produced by the process adopted for the next crop—early in March 1841, 2 roods, 21 poles of this Potato land were dibbled with 14½ lbs. of Barley, (to which my neighbours have given the name of 'Bartlett's American' from its superior quality) at 4 inches by 9, and deposited at least 3 inches deep and covered in with the feet after the manner adopted with Beans, and the land sown with ashes (made by burning the weeds dug out in cleaning the land, and others growing round the borders of my little field, with fresh lime from the kiln; by placing the weeds and lime in alternate layers and suffering them to remain till combustion was complete) in the proportion of 200 bushels to the acre. The crop was particularly fine, more than 4 feet high, and the number of corns in the ear varying from 27 to 37—some had 39; the whole produce was 31 bushels besides 1½ bushel of Tail-corn; the weight per sack 212 lbs., giving an increase of 117 lbs. for every pound dibbled without the tailing. I employ men to make the holes with the dibble, which makes five holes at once, and children to drop the corn; they work by a line and change their places every time, filling up the holes with their feet as they pass each other; the expense varies from 9 to 10 shillings per acre, according to the fitness of the land for the work.

"Besides the great saving of seed, the greater produce per acre, and its superior quality, considerable advantage would arise to the public at large, by giving employment to a greater number of persons, (who are, through want of work, in absolute want of food,) if dibbling was more generally adopted, as well as spade husbandry. —*W. B., Feb.* 7, 1842."

* With one error, *quarter* for *quart*.

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Beans.—Since the extension of thorough draining, and the consequent melioration of the soil, and its better adaptation to Turnip-culture, the extent of land devoted to this crop has been annually decreasing. Beans are, however, regarded as peculiarly well suited for the preparation of clay lands for Wheat; and it is owing chiefly to this circumstance that they are cultivated to so considerable an extent in East Lothian.

Beans are always sown after Oats or Wheat. The land intended for this crop is ploughed with a deep furrow in autumn, or early in winter, in order that any new soil which may be brought to the surface may receive the full benefit of the winter's frost. The manure to be applied to the crop is, in many instances, spread upon the stubble, and ploughed in with the winter-furrow; and this practice is much approved of where the land is sufficiently dry to admit of it, as it greatly expedites the work when the period of sowing arrives. The mode of preparing the soil for Beans varies very much in different localities, and under different circumstances, the preparatory tillage being regulated, in a great measure, by the nature and condition of the land and the state of the weather. In the case of dry and light soils, it is usual to give one or more ploughings, and a sufficient number of harrowings, to pulverise the soil, and disengage all root-weeds, which are carefully gathered off before forming the drills; but at the early period of the spring, in which Beans are sown, these operations are but seldom perfectly executed, even upon dry friable soils; whilst upon those of a strong tenacious character, such a course of preparatory tillage would, except in very favourable weather, be altogether impracticable. On the latter class of soils, therefore, the general practice is to form the drills on the winter furrow, without any previous tillage; but whatever preparation the land may undergo, the drills in which the seeds are deposited are formed precisely in the same manner by the common plough. They are commonly 27 inches apart.

When the dung has not been ploughed in with the first furrow, it is stored up in the field during the winter, and turned over to accelerate the fermentative process a short time before being required for use. The manner of applying it is as follows:—A sufficient number of drills being formed the dung is carried from the heap in single-horse carts, the horse walking in the interval of every third drill, and it is dragged out into small heaps, proportionate to the quantity to be applied per acre. Three or four women follow each cart to distribute the dung equally along the intervals of the drills, and the seeds are then sown by a machine which sows three drills together. According to the method pursued here of drilling with the common plough, a drill is formed by a single furrow, and the dung and seed are covered in by the plough in returning, so that the opening or formation of the drills, the carting and spreading of the dung, the sowing of the seeds, and the final covering of the dung and seed by reversing the first-made drills, are carried on in close succession and with much regularity.

The first culture bestowed upon the crop after sowing is a good harrowing, just before the young plants reach the surface, for the purpose of destroying the annual and other weeds that may be springing up. The subsequent culture given during the growth of the plants consists in horse-hoeing, hand-hoeing, and hand-weeding; the implements employed as horse-hoes are a common plough of small dimensions, drawn by one horse, and a drill-harrow or grubber, with coulters for cutting and tearing up weeds and pulverising the soil in the intervals between the rows. The small plough is used for paring away a portion of the earth from each side of the drills as close to the plants as the plough can go without injuring them, and the drill-harrow soon follows to pulverise and level the soil turned up by the plough, and to cut and drag up all kinds of weeds to the surfaces. The hand-hoers, women and boys, are then set to work, each takes a drill and cuts up any weeds which may have escaped or had been out of the reach of the previous instruments: weeds growing up amongst the plants in the rows are pulled by the hand. The horse-hoeing and hand-hoeing are repeated until the weeds are completely cleared off or destroyed, or until the crop has arrived at such a stage that further tillage would be injurious rather than beneficial. Where the soil is very wet, the plants are generally earthed up in the same manner as is done in the culture of Potatoes, but as the drills by being thus raised up occasion some inconvenience in ploughing the land for Wheat after the Beans are removed, this last operation is usually dispensed with, except the land is very flat and liable to injury from the retention of surface water.

When cutting this crop, which is always done by the sickle, two rows are taken together by each reaper, and the Beans are laid down in handfuls across the drills, in which state they remain a week or thereabouts, in order to allow the stems to dry and wither, when they are tied up in sheaves with short straw ropes, previously manufactured for the purpose, and distributed over the field. The sheaves, on being tied, are made up in stooks, in which they remain till ready for stacking. Bean-stacks are made of a small size, with a funnel or wind-kiln, as it is called, through the centre of each, to which there is a free access of air from without, by means of a low tress placed at the bottom.

The period of sowing Beans is usually from the latter end of February to the middle of March. The quantity of seed depends in some measure upon the quality of the land, and the size of the Bean; four bushels per acre is the general allowance. It is a common practice to mix a small quantity of Peas or Vetches with the Beans before sowing. The best quality of Vetch-seed is obtained by this means.

The produce per acre varies from 25 to 40 bushels per acre, but 30 bushels are reckoned a fair average crop. The usual weight of Beans is 62 to 68 lbs. a bushel.

Beans are used to a considerable extent in feeding horses and cattle; for the former they are generally boiled with Barley or mixed with Oats, and for the latter they are always made into a kind of coarse meal. It has been already stated that the bread of the farm-servants here consists of a mixture of Beans and Barley ground together. The straw is much valued as fodder for farm-horses.—*T. Sullivan.*

Home Correspondence.

Seaware.—About mid-winter last, some seaware having come on the shore attached to my farm, I had it carted and spread, in the proportion of about 45 one-horse carts per Scotch acre, on poor sandy land, in Oat stubble, intended for green crop this season, and ploughed in without loss of time. In spring the land was again ploughed, harrowed, and otherwise prepared for a crop of Potatoes. When the drills were drawn, African guano—about 5 cwt. to the Scotch acre—was spread in a part of them, and a very little loose earth drawn over it, after which the Potato-seed was planted and the drills covered up in the usual manner, both where there was no manure but the seaware, and where there were both seaware and guano, as above described. The Potatoes were planted on the same day. Those where the guano had been put were much earlier, and abundant in foliage, than those planted on the seaware by itself; indeed, the drills were covered long before any other Potatoes in the field—for I may observe that there was also a considerable quantity of that root planted on good stable manure there. That which attracted my particular attention was the very marked superiority of the crop where the seaware and guano were applied, over that where seaware only had been used. I now regret that a comparative trial of the weight or bulk of the Potatoes thus planted was not made. The fact is, those planted on seaware and guano being earlier at maturity than where seaware only, or stable manure had been applied, they were dug and used in the house and by the pigs immediately after the early Potatoes were done. The man who lifted them, however, states that he believes there was nearly a half—at all events a third—more Potatoes on the land manured with seaware and guano than on that with seaware alone, and they were a very large crop, and of excellent quality. Covering the seaware by the plough, as soon as it is laid on the land, is

a good way of using that manure—perhaps about the best—as its substance is preserved in the soil, which it helps to meliorate, during the process of decomposition. I have been induced to send you the above simple statement in regard to planting Potatoes on seaware and guano, not because I suppose there is any new discovery involved, but from a wish to draw the attention of those agriculturists who have the benefit of seaware for manure, to a mode by which they may raise excellent crops of Potatoes at a moderate expense. I am well aware that abundant crops of Potatoes are often grown, especially on mossy or soft land, manured with a large quantity of seaware alone; but the quality is rarely good, and the crop is generally late in ripening—in fact, scarcely fit for anything but seed. On good dry land there is no doubt that fair crops of Potatoes are raised with seaware for manure, but even here large quantities of this manure must be used. I propose next season to try Turnips manured in the same manner, viz., with seaware ploughed down in winter, and guano applied at sowing time, and have sanguine hopes that the experiment will be a successful one.—*J. Paterson, Whitehouse, Arran, Oct.* 17.

Allotments.—There appears to be a project on foot to regulate allotments by legislative interference—a scheme pregnant with many evils, and contrary to the principles on which this plan for the relief of the poor man should be based. There are objections to any measure compelling a parish to provide garden plots for labourers:—An extra expense is entailed upon rate-payers, a considerable part of which must necessarily fall upon a numerous class of men, who are hardly able to bear their present burthens; the number of parish officers, already more than sufficient for the management of parochial affairs, would be increased. It may be said, an Act of Parliament to compel parishes to provide land for the cultivation of the labourers and artisans, will improve their condition, and decrease the pauper lists. But a difficulty will naturally arise, as to who are the proper objects to benefit by the proposed law. Now, keeping in mind that the small rate-payers are part tenants in renting the land, and will have to pay their proportion in the event of there being any defaulters, they will expect, and with some justice, a portion of it as gardens for themselves. These applications will lead to constant bickerings and confusion. Again, the wardens to be elected as managers will be placed in no enviable position, and will find obstacles thrown in the way of an equitable adjustment of claims, which will prevent competent men from undertaking such harassing duties as they will have to perform. Let us suppose Parliament to have passed the Allotment Bill, and a half-rural parish is desirous to act upon it. Officers are appointed, and instructed to hire 20 acres of land, and apportion them into equal parts, amongst 60 heads of houses, according to the number of persons capable of working in their respective families. This is all very good, provided you have only the above number; but if there are 300, instead of 60, who assert their right to the indulgence, being themselves charged with a share of the expenses, in the event of a failure in the receipts for rent, what is now to be done? How are you to discriminate between the various parties? You cannot say to the hard-working man, who has never yet troubled the parish, and who has been struggling through all times to preserve his independence, "You can live without an increased income—we must pass you over, to relieve the parish rates and get rid of an idle man." Take your idle man, and what is the result?—no rent, and an additional charge to the industrious individual who was refused the land. The Allotment System can only be applied with success, either by individuals or a society, apart from parish officers or Acts of Parliament. The subdivision of land into small holdings is a dangerous precedent, and can never answer any good purpose. No man who is dependent upon his daily labour should have more ground than himself and his family can look after during their leisure hours—and in few instances more than half an acre. Spade husbandry having been proved to be so much superior to ploughing, how comes it that farmers do not more generally use the surplus strength of their parish in this lucrative manner? Dibbling is done by contract; and why should not digging a field be executed in the same manner as navigating—by gangs? Here is at once a fruitful source of occupation, which would obviate the necessity of parliamentary allotments, and render sufficiently effective the common practice of letting garden plots. Prejudice exists against the spade as a chief agricultural implement, on account of the expense. However, an increased produce and lowering the rates will amply repay the experiment, which I have no doubt practical men will acknowledge; and I hope soon to see it more commonly in vogue. I am fully convinced that a number of individuals may almost always be found, resident in a parish, who will be ready to superintend any plan which may be brought forward as a means of alleviating the distress of their poorer neighbours, without the assistance of legislative enactments. Persons anxious to promote the welfare of working men, should, before they advocate any plan which may increase the rates, attend regularly all parish vestries in their neighbourhood, which would convince them of the impossibility of squeezing more out of the small rate-payers than is at present annually obtained from them.—*Falcon.*

Roots of Wheat.—I gratefully acknowledge the reply of "J. C. C." to my query on this subject. I was not aware that attention had ever been publicly directed to the subject, and having this summer traced the roots of Wheat to a depth of upwards of five feet, I was anxious to know whether agriculturists were aware of the fact. In forming a kitchen garden I had occasion to trench a Wheat-field, and found that the soil was matted with fibres to the depth of about 4 feet 6, but stronger roots extended below that depth and were traced from 5 feet to 5 feet 6. The Wheat was a dwarfish variety, Red: so that the roots were, as "J. C. C." remarks, considerably longer than the stems. In the last two months I have asked many not unscientific farmers how deep Wheat roots? I have not found one who could answer the question, and I suspect if the Council of the Agricultural Society were catechised, few, if any, would know anything about it. Such being the case, I think you would confer a benefit on farmers generally, if you would embody the contents of "J. C. C.'s" information in your Leading Article and make it known that the average depth to which Wheat roots is 5 feet; which would, I suspect, be a stronger argument in favour of draining and subsoil-ploughing, and other novel operations of agriculture, than any other which can be urged; and will, in all probability, astonish, even to incredulity, 19 out of 20 of your readers; not to say 99 out of a 100.—*J. R.*

Salt as Manure.—My neighbours are crying out lustily against the depredations of the slugs amongst their Potato crops, scarcely one being free from severe marks. I have escaped this visitation; I attribute it entirely to having used salt last year. After my ground was cleared of the produce, I had it turned up rough and sowed salt broadcast over it; I also used a considerable quantity on my refuse heap, which accumulates during seven or eight months, and is composed of anything and everything I can collect on the premises, which there is a chance of converting into manure.—*Falcon.*

Chidham Wheat.—In answer to your Correspondent "Kirklington," I beg to inform you that Chidham Wheat is derived from a single stem of Wheat found in a hedge at Chidham in Sussex, on the farm now held by Mr. E. Wyatt, and is called so after the place. In Hants some call it Hedge Wheat.—*R. Gibbs, Guildford.*

On Harnessing Draught Animals.—On seeing the print of a portion of a horse and draught-chains in your columns, I was induced to read the paragraph relating to it, and not approving of the plan of harnessing there recommended, I was glad to see "A. J.'s" objections to it in No. 39. I agree with him to a considerable extent, and yet am willing to give due weight to your argument in favour of the plan to which he objects, even if it would do so, to strengthen it by relating a nearly similar anecdote. A fellow pupil called to me, "Try if you are stronger than I am, and pull out this roller." I attempted and failed. Our tutor looking on said, "I can tell you what will enable either of you to accomplish the task. Let one get on the other's back." We severally did so, and could perform it with ease. I am confident no means of adjusting the rope to our bodies would have enabled either of us to have pulled the roller from whence it was, without some additional weight to have given us firmer footing. Now, in the plan of harnessing recommended, the object being to relieve the shoulder at the expense of the back, there can be no additional weight.(!) My principal objection to your plan appears to have been hitherto overlooked. I think it must be apparent that in this method of harnessing, the greater the tension, the more the back-band is drawn down, the more will the neck-collar be raised against the animal's windpipe, thereby tending to choke him. As a proof of such tendency I may perhaps be allowed another anecdote. Three or four years ago, whilst riding, I met my carter half way up a Devonshire-hill, with a load of coal. I stopped him to give some directions for the morrow, and remarked that the back-chain was too tight—the horse would choke. He replied, "Oh no, sir, I was obliged to load forward to get from the vessel's side." The drag-staff was down, but the shaft-horse, a remarkably staunch yet nervous animal, refusing to yield, within two minutes fell on his side. I consider the usual method adopted in this country of attaching the trace to the collar, cramps and confines the shoulders more than necessary, and that it would do so much less if attached higher up the collar, and thus render the carriage-horse less unfit for riding. It is the tension or draught on the lower part of the shoulder I consider that makes the harness-horse so stilty in his action. This I have in great measure prevented in my carriage-horses, by using the swing instead of the fixed splinter-bar, and believe I shall entirely do so, by using Bencraft's patent hames. This invention is a boon to the coach-horse. I would recommend a somewhat similar contrivance for the use of the cart-horse also.—*B. Chilo.*

Scotch Farming.—It may be interesting to some English brother farmers who read this *Gazette*, to hear from one who has just crossed the border for the first time, an account of a few variations which meet the eye in Scotland, from the farming practised in our "ain dear land," as most of us consider Scotland the mother of improved agriculture. It was chiefly a bird's-eye view I could take of the country as travelling by coach, with the exception of having a talk with one or two farmers. The first thing which must attract attention on entering Scotland is the intelligent physiognomies of the children. This remark may appear rather inappropriate, but I believe that education is the foundation of all good farming. Another thing which struck me was the curious appearance of perhaps from twenty to forty stacks, and sometimes more than eighty, near the farm steadings, about half the size of our round ones, but most of them not thatched nearly so well as those in England. The part I first went through was East Lothian from Berwick, and then nearly through the heart of Mid-Lothian to Edinburgh, from there across the Firth of Forth to St. Andrews, through the fertile county of Fife; and in that distance I am glad to be able to say I only saw two slovenly fields (which were between Cupar and St. Andrews), out of which the Potatoes had not been taken. The reason of the excessive quantity of weeds in these was, I suppose, because the land had been allowed to get foul with previous crops. I noticed also that they ploughed the farmyard manure into the ground in a very green state, which no doubt, where the land is stiff, has the beneficial tendency of keeping it open. Another novelty was that every plough I saw was made of iron, and in some few fields they were working one-horse ploughs, I suppose to open a seed furrow for Wheat. The land I saw varied nearly as much as in England, although none of it required more than a pair of horses to work the plough, which cannot be said of many parts of England. By inquiry I found the Scotch do nearly all their weeding at the summer fallow, and at that time employ large numbers of women. What surprised me exceedingly was not to see one Corn-drill, but quantities of Wheat being sown broadcast. If I had seen pressing in vogue, or any other mode more adapted for light land, I should not have been surprised at the absence of the drill. I may as well add, that at a large farm where I was, they only had the old kind of Turnip cutter, and not any chaff-cutting machine for the horses. You will agree with me that this looks something like the son going a-head of his mother—comparing the best farming of England with that of Scotland. The Turnip crops are much better here than in most parts of England; and I believe they have an average crop of Potatoes, which they pit in the fields, where you may sometimes see heaps a hundred yards long. I was disappointed in not seeing many of our improved implements introduced into this far-famed country. The land certainly does immense credit to the farmers, taking into consideration the climate they have to contend with.—*Titus Oats.*

Societies.

EAST CUMBERLAND AGRICULTURAL SOCIETY.

At the late Annual Meeting and Show of this Society, Mr. Ellison, one of the Judges of Stock, gave the result of his experience in using bones and guano with respect to the Turnip crop. He had used four tons of guano this year, African and Peruvian, and from the appearances of the Turnip crop the African had answered as well as the Peruvian, although there was a wonderful difference in their price. He also had some Turnips sown with bones, which were likely to yield about 23 per cent. less than those which had been sown with the guano. Now this was singular, after what he had heard a very respectable farmer state, that on his farm the only effect on Grass was to make it a greener colour, and that though it made Corn greener for a while at first, it had no material effect upon the quantity produced. This soil was on a thin limestone bed, but he had tried it upon peat moss, and it acted equally well. With respect to the permanency of its effects, he could not yet ascertain it so well, and it was a known fact that bones were permanent in their effect. Corn from land which had been bone-manured would be stronger than from that produced by farmyard manure. But if they might believe a gentleman who had spoken at a meeting of the Royal Agricultural Society, the effect of guano was permanent, and therefore great benefit might be expected from its introduction. He would now say a few words with respect to Potatoes. He held an agency in Lancashire in 14 townships, and had therefore had ample opportunities of observation, and he might say that Potatoes there were a very failing crop indeed; and in his opinion it could be attributed to nothing but cutting the Potatoes before planting them as seed. It was a common saying with many people whose Potato crops had failed, that they had been carried off by the dry rot. But it was no such thing.(?) He was satisfied that it was an insect which penetrated through the Potato when it was cut, and ate up all its juices, so that it was impossible the stem could flourish. He had examined Potatoes in this way, and on taking them up, after being a fortnight or three weeks in the ground, the inside of the Potato was found like a sponge, and perforated with small holes. He had this year six acres of Potatoes, and they were all planted whole. He had also an acre in which the seed was cut, by way of satisfying his neighbours, and enabling them to judge of the difference of produce between the two modes. The six acres were as good as heart could wish for, while the acre in which the seed was cut was not half a crop. There was a tenant whom three years ago he threatened to turn off his farm if he continued to cut his Potato seed. He had seen him the other day, and he told him that it would have been 90*l.* in his pocket, if he had followed his advice, as he had lost 30*l.* a year by the old practice. A very effectual mode to prevent the worm amongst Potatoes was to wash them. Experiments of this kind had been made, and those Potatoes which had been washed when laid up for seed were found to be entirely exempt from this disease, which arose from the egg of an insect being deposited in the eye of the Potato. By washing the Potatoes in the autumn, the ova were of course washed out, and all danger obviated.

FARMERS' CLUBS.

Monmouth.—At the late Annual Meeting of this Club, Mr. Crawfurd made the following remarks:—The first consideration in Agriculture is climate; this is more of a grazing than a corn country; our green fields are unequalled, but our corn-growing is surpassed in many countries. An English meadow will fat a large ox, while many other countries have not pasture to feed a rabbit. That shows our prodigious advantage over other countries as a grazing country. Our country

is capable of producing green crops, while in the South of Europe they are unable to grow a Turnip or Mangold Wurzel. South Australia is not capable of growing a third of the turnips we are able to produce. The subject of draining is in this country most important; in other countries there is a lack of water, while in ours there is a superfluity. Arthur Young, when he went to Spain, said he saw at a glance that land there was nothing—water everything. The subject of irrigation deserves every attention; for himself, he proposed to make 15 or 16 acres of water meadow; and he would tell them the result of what he had already done. On a piece of 7 acres he had mown on an average of 3 tons per acre for his first crop, and 2½ tons for the second, which under ordinary circumstances would not have produced half as much. But there was another kind of irrigation. He had constructed a tank for the reception of the liquid from this dung heap, by the use of which a piece of land not an acre, is now worth five acres of common meadow. It had been fed by sheep for a month, after which he cut away 2 tons, and afterwards 2½ tons, being at the rate of more than 4 tons of hay from two crops; and there was another crop on the ground which he hoped to mow in eight or ten days. Suppose hay to be worth 4*l.* a ton, that would be at the rate of 24*l.* an acre; and he would defy them to produce anything else of that value on the same quantity of land.

Ottery St. Mary's.—Hedges.—I send you a copy of a resolution unanimously agreed to at the last meeting of this Club—16 members present. The subject of discussion for the evening was, The most suitable Size for Inclosures on Devonshire Farms, and the best Mode of keeping the Hedges. It was resolved unanimously, That on a farm, containing 100 acres of arable land, with an average proportion of pasture, the tillage land may be best cultivated by being divided into inclosures of not less than 10 acres each. A majority of the meeting were prepared to say not less than 15 acres; but the number 10 was inserted for the sake of unanimity. With regard to the hedges it was agreed that they ought to be pared down to the narrowest practical limits, consistent with the keeping of a sufficient fence, and annually shorn. As the above are the opinions of practical men, they may be interesting to some of your readers.—*Western Times.*

North Cornwall.—At the late meeting of this Club, the subject of Pickling Wheat for Seed was introduced for discussion. Mr. Bray recommended the application of sulphate of copper (blue stone) dissolved in water, poured on the grain at the rate of 1 lb. of sulphate of copper per 16 gallons of Wheat—to draw off the liquid not imbibed by the grain, and add half a pound of blue stone and a sufficient quantity of water to each following bag.—Mr. Rowe stated that a paper was read by Professor Henslow at the meeting of the British Association at Plymouth, on the Diseases of Wheat, and that after reviewing the several methods adopted in preparing the grain for seed, Professor Henslow gave the preference to the sulphate of copper.—The Rev. Mr. Wright stated, that he had applied during the season some manure of the finest description as top-dressing, and in the same field he had also applied the straw covering. The result was, that where he applied the straw his Grasses were improved in quality; while the parts of the field to which he had applied the manure, omitting the straw covering, produced only the Eaver and Daisy. He also mentioned that his dairy immediately improved when his cows were put on his strawed field; that the quantity as well as the quality of the milk was improved.—Mr. Williams, of Launcells Barton, had applied the fibrous covering. From the portion of a field which had been under the operation of the straw for seven weeks (during which time he had lifted it twice) he cut 3 tons 2 cwt. and 96 lb. of green Grass per acre, which weighed when dry exactly a ton. From the portion not strawed, he could not cut an ounce. He applied 58 bundles per acre, and he did not think the straw had much diminished in quality.—Several members expressed their opinion that cattle fed off the Grass produced by the operation of the straw, in preference to that not so operated on.—The Chairman then called on Mr. W. Bray for his paper on the Economy of Labour. Mr. Bray, in introducing the subject, spoke of the difficulty of recommending any change without the risk of creating strong feeling and excitement in the mind of the labourer, notwithstanding that their only object was the improvement of his condition. It had ever been his belief, and all his experience had confirmed it, that good wages get good men. With respect to the subject before the meeting, his opinion was that in order to economy, everything on a farm should be done with regularity as to time; the hours of labour should be fixed, and every labourer should be expected to commence his work at a given hour in the morning; the dinner time should also be settled, and all should cease their labour at a given time, whether at 12 or half-past, and recommence it at the expiration of the period allowed, say an hour through the summer, and half that time in the winter. In fact the labourers' hours should be clearly defined and regularly acted on. Mr. Bray then went on to describe at some length the irregularities now existing in the district, and their injurious results. After strongly urging the propriety of removing these irregularities, on the ground that such a change would tend to a better understanding between master and man, by removing many causes of needless distrust and suspicion, Mr. Bray proceeded to say that he thought it very desirable that what constitutes a fair day's work in the various kinds of agricultural labour should be determined and generally understood. From inquiries, he found that at present there existed not only various but also contradictory opinions on the question; the difference in the statements made to him by different farmers, amounted to 15, 20. 25, and even to 50 per cent. He thought that there should be some fixed rule, that some of the practical men of the neighbourhood should give the subject a careful consideration, and state in a tabular form their conclusions, so that what was deemed a day's work, according to the custom or usage of the neighbourhood, should be generally known. He thought that this would open the way to a much greater quantity of labour being done by piece-work, a mode of labouring every way more desirable for the labourers, and tending in his opinion to improve their condition—especially the industrious and able-bodied among them; a mode, too, which would ultimately tend very much to the advantage of their employers. It might, perhaps, be objected that the great difference found to exist on the same species of work would prevent its general adoption, but he would remind them that it was the same with manufactures, and yet most of that work was done by the piece. Others might say, the men will slight their work; but they had the same resource as they have in manufactories; such men should be discharged, and others taken that will do better. —An interesting discussion followed, concluded by Mr. James moving for a committee to ascertain the quantity of labour of the various kinds usually performed, and to settle the hours of labour, in order that a uniform system might obtain in the district.

Horncastle.—The Annual Meeting of this Society was held at Horncastle, on the 3d instant. The following remarks were made by Mr. Loft, of Trusthorpe:—"The landlords have not done all they might do, in promoting the employment and welfare of the industrious classes. There is one thing in which they can materially assist them—by breaking up of Grass-land. There is a great deal of Grass-land (I should call it waste land) that might be broken up with the greatest advantage. I know very well that it would be utterly profitless to break up the worst descriptions of Grass-land. But the land that I mean should be broken up is not of the worst quality but of a middle description—land full of water, and generally producing nothing but Rushes. You are all practical men, and I know will bear me out in what I am saying. You must break up Grass-land if you would increase the value of your farms, the amount of your produce, and the demand for labour. Which farm is it that does most good to the community? I answer, and you will all answer, that which affords the greatest amount of labour, and yields the greatest quantity of food; and I say by this means you will give employment to more labourers, and greatly increase the produce. I know that great improvements have taken place in this part of the county of late years, by breaking up what is called Grass-land. I can recollect, and my life is not a long one, when you might travel from this very town of Horncastle to Caistor, and see wold land covered with Gorse and Bracken, and now they produce plentiful crops of Wheat, of seeds, and of Turnips. I know that landlords generally entertained a great prejudice against ploughing up Grass-land, but where they have permitted it, it has been attended with the best results. I occupy a farm at Market Stainton, where I have had liberty to break up upwards of 100 acres. It is now only twelve years since I entered upon it, and I will venture to say that I grow three times more corn, and keep more stock by half; and I am sure I have no hesitation in saying that if the property were brought to the hammer, it would make from 15*l.* to 20*l.* per acre more than in its original state. I know there is a great abundance of land in this county which is now almost profitless, which might be made to produce a great deal of corn, employ a large amount of labour, and be greatly improved in value by this process."—Mr. Brothwell stated that he went to visit a large farm, but looked in vain for a piece of Grass-land. He said, "Where is your Grass-land?" "I have none," said his friend, "and I want none; it's only the old-fashioned folks on the other side of the Witham that want Grass-land." Mr. B. stared at him, and began to think that his horse would only be badly off for provender, but he found he need not have feared; his horse was well supplied with corn and seeds, and his friend, who is a most successful and intelligent farmer, had no more Grass-land than his house paddock.—Mr. Stanhope said, "I have thought the matter over a good deal, and have talked with several gentlemen on the subject, and I think nobody would plough up good land, and at the same time nobody would keep bad. I do not wish to do in a hurry what I should afterwards be sorry for. It is easy to say plough up Grass-land. I know it is so much easier to plough up Grass-land than it is to restore it to its pristine condition, that we ought to well consider the matter. Only the other day I rode down into the Fen; I was shown a piece of land, and was asked what it was. It might have been anything for what I could see. I was told it was seeds, but there really was nothing on it. I was afterwards told that that very field had been one of the best Grass-fields in the county. It behoves gentlemen to be very cautious, and know what they are doing, before they disturb such land. We have been told of the benefits that would arise from ploughing up the Grass-land that is covered with Rushes, and of the employment it would afford to the labourer; but, gentlemen, I should first wish to employ the labourers in thoroughly underdraining that land; I would then manure it well, and give it a fair trial, and if it did not then turn out well, and it would be more advantageous to plough it up, so let it be."

Tring.—At the fourth annual meeting of this Association, lately held, the Chairman, Mr. J. A. Gordon, observed that—In Morayshire he had met with a gentleman who informed him that he had recently seen on the farm of Findrassie a plot of land which seemed to bear Barley and Clover as if they were growing on a dunghill, and that that effect was produced by singular means. He wrote to Dr. Forster, who was kind enough to send him an account of the subject, which was the novel and surprising one of the influence of electricity on the growth of plants. Mr. Crosse, of Taunton, had long since proved that the free electricity of the air might be easily collected by wire suspended on poles of wood at many feet from the earth's surface. Dr. Forster placed two poles four feet high in his front lawn, which had been recently laid down with Chevalier Barley and Grass, and over those poles, which were due north and south of each other, he stretched a common piece of iron wire, fixing the two ends of it to stout wooden pins, driven in close to the earth, and on the edge of the plot of eight English poles, and around the edges, which were straight lines, he sunk about two or three inches beneath the earth two wires of equal length, the ends of which were fixed and in contact with the two ends of the suspended wire, which were meant not to be too tight, for its contraction in cold nights would break it in two, or pull away the fixtures, and thus defeat the object. Dr. Forster formed two of these plots for experiment, measuring eight square poles each; and then, proceeding to criticise his work, he sought the aid of Noad's "Popular Lectures on Electricity and Galvanism," and almost the first half-hour's perusal showed him that there was such an error in one part of his plan as would effectually defeat his intention. This was, that the point of a blade of grass or young Corn-plant has the most extraordinary faculty or power of attracting or appropriating to itself all the free electricity present, at four times the distance that the finest point of metal could. So that when the points of the Barley-plants should reach one foot high all the electricity that the suspended wire might collect and convey through the buried wire to the roots of the plants, would be abstracted by the leaves of the Barley, and thus the suspended wire, getting nothing from the air, could not, of course, supply anything, so that all electrical influence would cease. Dr. Forster, therefore, placed poles 11 feet high above the surface, with wires, &c., exactly the same, except that the space surrounded by the buried wire was 24 poles English measure. All the results are yet imperfectly known, but the following were evident:—The Barley plants on the two smaller plots (of eight poles each) soon became darker in colour, and grew faster until they had attained to about a foot in height; the darker green colour then gradually disappeared, and at the end of a fortnight there was no perceptible difference but in the height of the young Barley plants, and even this ceased to be very apparent as the crop advanced. When the Barley of the larger, or 24 poles plot, was six inches high, it assumed the same lively dark green, and grew faster than the surrounding unelectrified Barley plant, and this difference it maintained up to the last, except that the colour, of course, in time became yellow, and it was curious that this change occurred later than in the rest of the crop. The number of stooks or shocks was also greater, and each larger when reaped; the ears from one grain of seed were more numerous and longer, the Corn also was larger and harder.

Miscelianeous.

Hop-growing.—As to the tying of Hops, the buds that do not clasp of themselves to the nearest pole when they are grown to three or four feet high, must be guided to it by the hand turning them to the sun, whose course they always follow. They must be bound with withered rushes, but not so close as to hinder them from climbing up the pole. Continue to do this till all the poles are furnished with bines, of which two or three are enough for a pole, and all the sprouts and bines that you have no occasion for are plucked up; but if the ground be young, then none of these useless bines should be plucked up, but should be wrapped up together in the middle of the hill. When the bines are grown beyond the reach of your hands, if they forsake the poles, you should make use of a stand-ladder in tying them up. Towards the end of May, when you have made an end of tying them, the ground must have the summer dressing: this is done by casting up with the spade some fine earth into every hill. A month after this, hoe the alleys with a Dutch hoe, and make the hills up to a convenient bigness. About the middle of July Hops begin to blossom, and will be ready to gather about the end of August. A judgment may be made of their ripeness by their strong scent, their hardness, and the brownish colour of their seed. When by these tokens they appear to be ripe, they must be picked with all the expedition possible; for if at this time a storm of wind should come, it would do them great damage by breaking the branches, and bruising and discolouring the Hops; and it is very well known, that Hops picked green and bright, will sell for a third more than those which were discoloured and brown. The most convenient way of picking them is into a long square frame of wood, called a bin, with a cloth hanging on tenter-hooks within it, to receive the Hops as they are picked. The frame is composed of four pieces of wood joined together, supported by four legs, with a prop at each end to bear up another long piece of wood, placed at a convenient height over the middle of the bin; this serves to lay the poles upon which are to be picked. This bin is commonly eight feet long, and three feet broad; two poles may be laid on it at a time, and six or eight persons may work at it, three or four on each side. It will be best to begin to pick the Hops on the east or north side of the

ground, if you can do it conveniently; this will prevent the south-west wind from breaking into the garden. Having made choice of a plot of the ground containing eleven hills square, place the bin upon the hill which is in the centre, having five hills on each side; and when these hills are picked, remove the bin into another piece of ground of the same extent, and so proceed till the whole Hop-ground is finished. When the poles are drawn up to be picked, take care not to cut the bines too near the hills, especially when the hops are green, because it will make the sap to flow excessively. The Hops must be picked very clean. *i. e.*, free from leaves and stalks; and, as there shall be occasion, two or three times in a day, the bin must be emptied into a Hop-bag made of coarse linen cloth, and carried immediately to the oast or kiln to be dried; for if they should be long in the bin or bag, they will be apt to heat and be discoloured. If the weather be hot, there should be no more poles drawn than can be picked in an hour, and they should be gathered in fair weather, if possible, and when the Hops are dry; this will save some expense in firing, and preserve their colour better when they are dried. The crop being thus bestowed, take care of the poles for another year, which are best to be laid up in a shed, having first stripped off the haulm from them; but if you have not that conveniency, set up three poles in the form of a triangle, or six poles (as you please), wide at bottom; and having set them into the ground, with an iron picker, and bound them together at the top, set the rest of your poles about them; and being thus disposed, none but those on the outside will be subject to the injuries of the weather, for all the inner poles will be kept dry, unless at the top; whereas, if they were on the ground, they would receive more damage in a fortnight than by standing all the rest of the year. The best method of drying Hops is with charcoal, on an oast or kiln, covered with hair-cloth, of the same form and fashion that is used for drying malt. There is no need of particular directions for making these, as every carpenter and bricklayer in those countries where Hops grow, or malt is made, knows how to build them. The kiln ought to be square, and may be of 10, 12, 14, or 16 feet at the top, where the Hops are laid, as the plantation requires and room will allow. There ought to be a due proportion between the height and breadth of the kiln and the beguels of the steddle where the fire is kept; viz, if the kiln be 12 feet square on the top, it ought to be 9 feet high from the fire, and the steddle ought to be 6½ feet square, and so proportionable in other dimensions. The Hops must be spread even upon the oast, a foot thick or more, if the depth of the curb will allow it; but care must be taken not to overload the oast if the Hops be green or wet. The oast ought to be first warmed with a fire before the Hops are laid on, and then an even steady fire must be kept under them; it must not be too fierce at first, lest it scorch the Hops, nor must it be suffered to sink or slacken, but rather be increased, till the Hops be nearly dried, lest the moisture or sweat which the fire has raised fall back and discolour them. When they have lain about nine hours they must be turned, and in two or three hours more they may be taken off the oast. It may be known when they are well dried by the brittleness of the stalks and the easy falling off of the Hop-leaves. It is found by experience that the turning of Hops, though it be after the most easy and best manner, is not only an injury to them, but also a waste of fuel and time, because they require as much fuel and as long a time to dry a small quantity, by turning them, as a large one. Now this may be prevented by having a cover (to be let down and raised at pleasure) to the upper bed whereon the Hops lie. This cover may be also tinned, by nailing single tin plates over the face of it; so that when the hops begin to dry and are ready to burn, *i. e.*, when the greatest part of their moisture is evaporated, then the cover may be let down within a foot or less of the Hops (like a reverberatory), which will reflect the heat upon them, so that the top will soon be as dry as the lowermost, and every Hop be equally dried. As soon as the Hops are taken off the kiln, lay them in a room for three or four weeks to cool, and toughen; for if they are bagged immediately they will powder, but if they lie a while (and the longer they lie the better, provided they be covered close with blankets to secure them from the air) they may be bagged with more safety, not being liable to be broken to powder in treading; and the harder they are trodden the better they will keep. The common method of bagging is as follows:—Have a hole made in an upper floor, either round or square, large enough to receive a Hop-bag, which consists of four and a half ells of ell-wide cloth, and also contains ordinarily two hundred and a half of Hops; then tie a handful of Hops in each lower corner of the bag to serve as handles to it; and then fasten the mouth of the bag so placed that the hoop may rest upon the edges of the hole. Then he that is to tread the Hops down into the bag, treads the Hops on every side, another person continually putting them in as he treads them, till the bag is full; when being well filled and trodden, they unrip the fastening of the bag to the hoops, let it down, and close up the mouth of the bag, tying up a handful of Hops in each corner, as was done in the lower part. Hops being thus packed, if they have been well dried, and laid up in a dry place, will keep good several years; but care must be taken that they be not spoiled by the mice making their nests in them.—*E. P., in the Scientific and Practical Agriculturist.*

Gypsum, a fixer of Ammonia.—Gypsum is frequently also applied in a state of powder, as a top-dressing to and, and is said not only to afford food to such plants as require sulphuric acid and lime, but that it also operates as a means of fixing and retaining the ammonia, with which the rain is impregnated, which would otherwise evaporate before the plant could seize upon it. In our concern,* where we have a great number of horses, we use gypsum in our stables, strewing it on the floor, which arrests the ammonia as it is formed, and thereby not only helps to preserve a very valuable fertiliser, but also renders the stables much more wholesome for the horses. I have also, as an experiment, hung up in the stables a plate containing diluted sulphuric acid, and have observed small crystals of sulphate of ammonia formed at the edges of the plate, from the acid combining with the ammonia floating in the air in a gaseous state. If, in the hot stables that are sometimes met with at inns, where the air is so charged with ammoniacal vapours, that when you enter your eyes are affected, a little gypsum were strewed on the floor every day, or trays containing sulphuric or muriatic acid were suspended, all that offensive smell would be done away, and the stable be much more healthy for its inhabitants.—*On the Use of Gypsum, &c., by H. Briggs, Wakefield.*

Notices to Correspondents.

AGRICULTURAL REPORT OF NORFOLK.—*S. D. E.*—It is certainly a useful book; and would probably be beneficially employed as you propose.

BONES.—*H. A. S.*—The present is the best time to apply bone-dust to Grass land. Apply 16 to 20 bushels per acre.—We never knew a horse refuse Lucerne.

COWS.—*Chepstow Subscriber.*—In our experience of oil-cake as food *for sheep*, the addition of 1 lb. diminished the consumption of Swedes from 6 to 8 lbs; it is probable that 4 to 6 lbs. given daily to a cow would diminish the quantity of the other food given to it to three-quarters its former amount; at the same time enriching the milk afforded. The amount of cake may be given broken in small pieces by the ordinary cake-crusher, to the cows confined in sheds. There does not exist, in the case of the cow or sheep, the same necessity for finely reducing their food, that there is in the case of the horse and of others which do not chew the cud.

FLAX SEED.—*An Old Grazier.*—Several articles on Flax-seed as food, by Mr. Sproule, which have lately appeared in our columns, will give you a good deal of information. The compound is prepared on the farm.

FOOD FOR SHEEP.—*Subscriber.*—Oil-cake broken in small pieces should be given to them in a trough to the amount of from 12 to 16 ozs. a-piece each day. Oil-cake and hay will fatten sheep; they will need water.

GUANO.—*Dublin.*—This and all other manures, whose value depends partly on soluble ingredients, is best applied in spring—say early in April.

HOPS.—*Humulus. Bradford.*—The male plants are useless. In the hope of eliciting an account of the Hop-cultivation of Kent and Sussex we shall insert your letter next week.

MR. WARNES' BOXES.—*Subscriber.*—Perhaps next week.

PIGS.—*Subscriber.*—The water in which Swedes, &c., have been boiled is not injurious.

POTATO CULTURE.—*J. L.*—You may as well dig in the manure *now*; you may safely take your second crop of Potatoes.

POULTRY.—*Original Subscriber.*—We never noticed the fact to which you allude, and know not how to explain it.

STALL-FEEDING.—*H. S. T.*—The heat and itching of the skin is an almost constant attendant on high feeding, particularly if Bean meal (in which nitrogenised elements abound) forms a large portion of the diet. It may be moderated very much by giving occasionally the following powder in the food:—Super-tartrate of potash, 1 oz.; Nitrate of potash, 6 drs.; Flowers of sulphur, 4 drs. If the itching is excessive, change and moderate the food.—For destroying the vermin of store cattle employ the following:—Sulphur vivum, 4 oz.; Oil of tar, 4 oz.; Whale oil, 1 pint; to be gradually mixed together. Sometimes the two latter ingredients alone will prove effectual.—*W. C. S.*

WHEAT.—*H. Dowling.*—Wheat often, indeed generally, sends out roots from the first joint in the straw, but seldom in so early a stage of its growth as in your specimen.——*T. Paul.*—Sow guano at the rate of 2 cwt. per acre, and nitrate of soda at the rate of 1 cwt. per acre, mixed together, broadcast; sow on a wet day in April over your young Wheat: see above—Guano. Use the *fine* bone dust, not the half-inch kind.

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, Oct. 28.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s	0	Best Downs & Half-breds	3s	10 to 4s 0
Best Short Horns	2	6	3	10	Best Long-wools	3	6 3 10
Second quality Beasts	2	8	3	2	Ewes and second quality	3	0 3 6
Calves	3	4	4	2	Pigs	3	4 4 0

Beasts, 4079; Sheep and Lambs, 29,950; Calves, 114; Pigs, 481.

Our supply of Beasts to day is very large, and much of it of inferior quality. It is difficult to make 4s of anything; yet, the best beef not being very plentiful, that price is obtained in several places. Many middling ones are left unsold. There are a few more Sheep, but the best qualities are still readily sold at about 4s per 8 lbs. Veal-trade is heavy; the best Calves are, with difficulty, disposed of at about 4s 2d per 8 lbs. Pork-trade is steady.

FRIDAY, NOV. 1.

We have more Beasts to-day than are required for the trade; the demand being very limited. A few of the best Beasts made 4s per 8 lbs., but 3s 10d is the more general price. Short Horns about 3s 8d, with some at 3s 10d; second quality 2s 8d to 3s 2d. Sheep trade is very heavy; the demand on Friday, this time of the year, being generally small, we are overdone in quantity. The dead-trade has also been very bad all the week. The best Downs, &c. realise nearly 4s, and Long-wools 3s 10d per 8 lbs. Ewes, &c. 3s to 3s 6d. It is with difficulty the best Calves make 4s per 8 lbs. Pork-trade remains about the same.

Beasts, 837; Sheep, 4630; Calves, 213; Pigs, 390.

41, West Smithfield.

POTATOES.—SOUTHWARK WATERSIDE, Oct. 28

In consequence of the arrivals being large at the time you received our last report, and the supply being also liberal during the past week, these together have been more than equal to the demand, which has caused a great depression in our Markets, and a considerable reduction in the prices. The best samples of York, Scotch, and Devons, moved off at the annexed quotations; but the inferior samples of Reds, also the different samples of Whites, were a complete drug.

* Flockton Colliery, near Wakefield.

COVENT GARDEN, Nov. 2.—The market has been well supplied during the past week, but the demand has been comparatively trifling; trade in general is dull. Amongst Pine-apples there are some good fruit which are offered at last week's prices. Little variation has taken place in the prices of Grapes; good samples of Black Hamburgh bring about 4s. per lb., and the best foreign Grapes are selling at about 1s. 6d. per lb. The principal dessert Pears are the Marie Louise and Louise Bonne; these, as well as other varieties have not varied in prices since our last Report. Apples are also offered at nearly the same prices as quoted last week. A few specimens of Coe's Fine Late Red and other Plums are still in the market, but they are very scarce. Damsons are almost over. Nuts of all kinds are sufficient for the demand; good Walnuts bring about 5s. per bushel. Quinces are plentiful. The prices of most kinds of vegetables remain nearly the same as last week. Broccoli is not quite so plentiful. Cauliflowers are good and sufficient for the demand; as are also Cabbages, Savoys, Brussels Sprouts, and other winter greens. We noticed some fine samples of French Beans, which are selling at nearly the same prices as last week. Abundance of Turnips and Carrots are offered; and Celery of good quality continues to be well supplied. A few Tomatoes may still be obtained; they are a little cheaper. Endive, Lettuces, and other salading are offered at nearly the same prices as last week. Among Cut Flowers we noticed Bignonia venusta, Combretum purpureum, Allamanda cathartica, Rondeletia speciosa, Double Chinese Primrose, Leschenaultia formosa, Epiphyllum truncatum, Gloxinias, Heaths, Amaryllises, Heliotropes, Neapolitan Violets, Cinerarias, Pelargoniums, Verbenas, Camellias, Picotees, and Roses.

HOPS, FRIDAY, NOV. 1.

SINCE our last statement the Hop Market has gradually improved, and to-day our quotations are as follow:—

Choice Mid and East Kents - - -	10l 10s to 12l 12s	Choice Weald of Kents	7l 15s to 8l 8s
		Ditto Sussex -	7 7 7l 18s

The Duty is still estimated at 130,000*l.*

PATTENDEN & SMITH, Hop-Factors.

MARK-LANE, MONDAY, Oct. 28.

THE supply of Wheat from Essex, Kent, and Suffolk was moderate this morning, and sold readily at the prices of last week; in Foreign there was little doing, and its value remains unaltered. Having a small attendance of the Barley buyers, in consequence of the Queen's visit to the City, this article sold slowly at our late quotations. Beans and Peas of all descriptions are fully as dear. Notwithstanding the large arrival of Oats, they met a tolerably active sale, and we observe no alteration in their value.

FRIDAY, NOV. 1.

THE attendance at Market this morning was small, the extent of business limited. In Wheat either English or Foreign we observe no alteration. The best qualities of English Malting Barley support their late value, but having a large arrival of Foreign it met a slow sale, and must with secondary sorts of home growth be written 1s. lower. Beans and Peas maintain Monday's prices. New Irish Oats are a very dull sale, but, notwithstanding a good supply of Foreign, they and all descriptions of old are fully as dear.

KINGSFORD AND LAY.

WOOL.—BRITISH, FRIDAY, NOV. 1.

OUR Market has been very quiet for some time past, but few sales have been effected. In some cases, lower prices have been submitted to, but we do not think this has been generally the case. Notwithstanding the accounts from the manufacturing districts of the lessening production, an opinion pretty generally obtains that prices will rally. The light stock in the hands of the growers, together with moderate rate of provisions, seems to favour such opinion.

JAMES PERRIN, Wool Broker.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.			Patent Door and Frames.	Fire-bars & Dead Plate.		Flue Door.		Damper.		Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£	s.	s.	s.	d.	s.	d.	s.	d.		
10	1	5	20	7	6	6	6	2	6	30 feet.	12 to 20
Ribbed Boiler.											
10	2	2	20	10	6	7	6	2	6	50 to 70 ft. 4 in.	Under 25 to 40
12	2	15	30	12	6	7	6	3	6	80 to 125 feet.	40 to 65
14	3	10	35	17	5	8	6	4	6	150 to 250 feet.	65 to 100
18	5	5	42	25	0	8	6	5	6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
21	8	15	50	35	0	8	6	7	6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower Stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

CONICAL BOILERS.—The Boilers invented by JOHN ROGERS, Esq., are made of several sizes, and may be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple place, Edgware-road Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Nov. 2, 1844.

WHEAT-SOWING.

GUANO; Genuine Peruvian, Bolivian, and Ichaboe, on Sale; also Potter's Guano, Gypsum, Sulphuric Acid, Sulphates of Iron and Copper, and all other manures. Synopsis of prices, and mode of use, on application, &c.—Apply to MARK FOTHERGILL, 40, Upper Thames-street.

MR. LAWES' MANURES.—Mixture for Wheat, 7*l.* per ton; Super-phosphate of Lime, 7*l.* per ton. To be had at the Factory, Deptford Creek, near London.

Super-phosphate of Lime, in a concentrated form, may also be procured at Messrs. WARNER'S, 28, Cornhill, in 7 lb. packets, price 1s.

WHEAT SOWING AND GRASS DRESSING.

BRAIN'S GUANO, superior to any imported, being of uniform strength and composition, see Analysis, "Farmers' Journal," Oct. 21, 1844.

TESTIMONIAL.—Copy of a Letter received from John Hill, Esq., Headstone Farm, near Pinner, Middlesex.—Sir,—Having been induced by your agent, Mr. William Stransom, of Uxbridge, to use some of your Guano manure, together with other sorts, and after careful application and watching, I must say yours has proved the most useful, and far preferable to the Foreign. My land is a strong clay. I should recommend it as a top-dressing for Wheat, Grass, &c, to be used in the state you send it out, without any mixture, and to be harrowed in. The difference in the produce of Wheat where your manure and the others were used may be seen at my farm. I think it a duty to yourself and the public to state that I shall be happy to give any information as to how I applied it.—Yours, &c. JOHN HILL.

Headstone Farm, near Pinner, Middlesex, Oct. 24, 1844.

To Frederick Brain, Esq.

N.B.—I shall try it this year drilled with Wheat.

Price 9*l.* per ton. Sacks free of any charge, delivered free to any Wharf or Rail, in Town.—Works, Thomas-street, Duke-street, Stamford-street, Blackfriars-road.

Brain's Highly concentrated Liquid Guano, 1s. 9*d.* per Bottle, enough for 80 Gallons of Liquid Manure as usual. Of all respectable Florists, Seedsmen and Chemists, in Town and Country.

DR. HALLETT'S DRY SOLUBLE FERTILIZER'S are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried things (see No. 33 of the *Gardeners' Chronicle*, &c.). 5 cwt. of either has been found equal to nearly 30 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10*l.* per ton, or 12s. per cwt.

DR. HALLETT'S CONCENTRATED LIQUID FERTILIZER is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1s. 6*d.*, and in bottles, six times the size, at 7s. 6*d.* Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Warner & Warner, 28, Cornhill; Hurst & M'Mullen, 6, Leadenhall-street; Winstanly, Poultry; Pace & Co., St. Peter's Alley. Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mott and Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seward, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. D. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace & Co. Dundee—Green and Co. Further respectable Agents wanted.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5 A, Hawley-road, Kentish Town.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c. 70, STRAND, LONDON.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill-row, London.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, &c.

McKIBBIN'S PATENT ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY.

The disadvantages attending other materials used in roofing, preventing, to a great extent, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle sheds, Workshops, Ropewalks, &c., and for the sides, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coping, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of carriage is inconsiderable in comparison with slates, tiles, &c., and it is not liable to contraction like zinc.

Sold in sheets 32 inches by 20, at 5*d.* each (being less than 9s. 6*d.* per square of 100 feet), with printed directions for applying them, same as adopted at the Government Dock-yards and various other public buildings.

Orders will meet with prompt attention if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall-street, London, or to the following agents:—Liverpool, Messrs. Grueber & Co., 11, Manesty-lane; Plymouth, Thomas Stevens, Esq.; Birmingham, William R. Loyd, Esq.; Sunderland and Newcastle-on-Tyne, Messrs. John Ritson and Sons; Hull, William Ward, Esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, William Todd, Esq.; Glasgow, Malcolm Carmichael, Esq., St. Enoch-square; Cork, Messrs. Richard Wallis & Co.; Belfast, Messrs. Grueber & Co., Dunbar's Dock; who have also on sale McKIBBIN'S improved SHEATHING, BOILER, RAILWAY, and other FELT.

*** The "IMPROVED ROOFING FELT" will be found much more durable than the Common Felt made in lengths, and not subject, like it or continuous sheets of other material, to be stripped by storm; *it does not require to be either painted or coated*, can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers, for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

H. WALKER'S NEEDLES (by Authority the "Queen's Own") have large eyes, easily threaded, (even by blind persons), and improved points, temper, and finish. Each paper is labelled with a likeness of Her Majesty or His Royal Highness Prince Albert, in relief, on coloured grounds. Every quality of Needles, Fish-hooks, Hooks-and eyes, Steel Pens, &c., for shipping. These Needles or Pens for the home trade are sent free, by post, by any respectable dealer, on receipt of thirteen penny stamps for every shilling value.

H. WALKER, manufacturer to the Queen, No. 1 (late 20), Maiden-lane, Wood-street, London.

THE BEST ENGLISH WATCHES.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank, request the attention of purchasers to their stock of London-made PATENT LEVER WATCHES, which are manufactured by themselves, in their own house. In silver cases, with the detached escapement and jewelled, the prices are four and a half guineas, six, and eight guineas each; or in gold cases, 10, 12, 14, and 16 guineas each. The very large stock offered for selection includes every description, enabling a customer to select that which is more particularly adapted to his own use.

STOOPING of the SHOULDERS and CONTRACTION of the CHEST are entirely prevented, and gently and effectually removed in Youth, and Ladies and Gentlemen, by the occasional use of the PATENT ST. JAMES'S CHEST EXPANDER, which is light, simple, easily employed outwardly or invisibly, without bands beneath the arms, uncomfortable constraint, or impediment to exercise. Sent per post, by Mr. A. BINYON, 40, Tavistock St., Strand, London, or full particulars on receiving a postage stamp.

SUBSCRIPTIONS

FOR THE

NATIONAL TESTIMONIAL

TO

MR. ROWLAND HILL,

AUTHOR OF THE PENNY POSTAGE,

WILL CLOSE ON THE 30TH OF NOVEMBER.

Of all the sources of income stated in the recently published Quarterly Returns of the Public Revenue, none exhibit *so large* a proportionate increase as the *Post Office*. On the year's net Revenue, the Customs have increased at the rate of about 10 per cent., the Excise 1½ per cent., the Property Tax 2 per cent., while the *Post Office Revenue*, under its almost nominal rate of a penny, has increased above 13½ per cent., and the increase on the quarter has been even as much as 25 per cent.

These cheering results show that (though the *plan of Penny Postage* is yet but *imperfectly tried*, the *complete restoration* of the Post Office Revenue to its amount before the Penny Postage was adopted is not an event far distant, if it be fully and honestly carried out; and the *City of London Mercantile Committee on Postage* desire to impress these satisfactory results most emphatically upon the Public, in announcing the *approaching close* of the National Testimonial to Mr. Rowland Hill. *All* parties are unanimous upon the great *moral* and *commercial* advantages of the *Penny Postage*. Its expediency as a *financial* step has been the *sole* ground of question; but now, even this *can scarcely be doubted*; for, let it be remembered, that the Old Postage Revenue had been absolutely *stationary* for twenty years,—retrogressive, in fact, if we consider the increase of population, education, and commerce during the period. The change which Penny Postage has effected, is to make the *Post Office Revenue* the *most buoyant* source of National Income, bidding fair to become more profitable than it has ever been. The Committee, therefore, call upon the Public to reward, with suitable gratitude, the Author of this great and triumphant measure.

The Committee have the satisfaction to announce that the Subscriptions, headed by the chiefs of political parties and of commercial wealth, already reach 10,000*l.*; but 10,000*l.* cannot be held to be a sufficient *national* reward for such *national* services. The Committee therefore urge upon the *nation at least to double* this sum. If every letter-writer, for only a single week, would pay a twopenny instead of a penny rate for his letters, the amount, and more, would be raised. In proportion as the public show their gratitude to Mr. Hill, so they strengthen the chances for the complete adoption of his plan, *now but partially carried out*. Its perfection will bring greatly-increased convenience to themselves, and increased advantage to the Post Office Revenue.

Never have the services of any *Public Benefactor* been *requited* as Mr. Hill's have been. Quitting a *permanent* situation for a *temporary* public engagement to carry out his plan, Mr. Hill's services, whilst his plan was yet not carried out, were dispensed with, and he received the following acknowledgments of his merits, and—*nothing more*:—

"I gladly avail myself," writes the present Chancellor of the Exchequer, "of the opportunity of expressing my sense of the satisfactory manner in which, during my tenure of office, you have discharged the several duties which have been from time to time committed to you." "I entertain," writes Sir Robert Peel (who has also subscribed 10*l.* to the Testimonial), "a due sense of the motives by which your conduct, in respect to Post-Office arrangements, has been actuated, and of the zeal and fidelity with which you have discharged the duties committed to you."—Mr. Trevelyan, on behalf of the Lords of the Treasury, writes thus:—"I am also commanded by their Lordships to take this opportunity of stating, that they consider it due to you, on the termination of your engagement with the Government, to express to you the approbation with which they have regarded your zealous exertions in the execution of the duties which have been intrusted to you; and how materially the efficiency of the Post Office arrangements has been promoted by the care and intelligence evinced by you in the consideration of the various important questions which have been referred to you."

Under these circumstances the Committee call upon the *Public* to come forward with due generosity, and reward Mr. Hill themselves, as the *unrequited Inventor* of the *great measure of Penny Postage*—a measure which has opened the blessings of free correspondence to the Teacher of Religion, the Man of Science and Literature, the Merchant and Trader, and the *whole British Family*, especially the *poorest* and most *defenceless* portion of it;—a measure which is the *greatest boon* conferred in modern times on *all the social interests* of the *civilised world*; for Penny Postage is spreading its influence throughout Europe, and reaching even Russia. The Committee rely on the gratitude of their countrymen, and feel sure that this, their last appeal, will not be made in vain.

(Signed) GEO. LARPENT, Chairman.

Subscription Cards, and every information, &c., may be obtained on application to the Secretary, Mr. GEORGE WANSEY, Solicitor, 3, Moorgate-street, London.

Just published, in demy 12mo, price 6s. cloth, pp. 339.

Societies.—COMPLETION OF THE BRITISH ASSOCIATION REPORT: Section A, Wednesday; Section C, Tuesday and Wednesday; Section D, Tuesday and Wednesday; Sub-Section D (Ethnology), Friday, Saturday, Monday, and Tuesday; Section E, Tuesday; Section F (Statistics), Tuesday and Wednesday; and Section G, Wednesday.

Miscellanea.—Paris Academy of Sciences—Pneumatic Marine Preserver—An Iron Life Boat.

Order The Athenæum of any Bookseller or Newsman.

HOOD'S MAGAZINE for NOVEMBER.—Price 2*s.* 6*d*, contains:—

The DEATH of CLYTEMNESTRA, by SIR E. L. BULWER LYTTON, Bart.; The LAY OF THE LABOURER, by the Author of the "SONG OF THE SHIRT." OUR FAMILY. A DOMESTIC NOVEL. Chapter XVI. A Mystery—Chapter XVII. A Clue, by the Editor.—Verses to the Acorn; by Miss H. Lawrence—Epigram on Her Majesty's Visit to the City—The Streets of Paris—Gideon Shaddoe—Sonnet; by the Editor—The Peace of Birds; by the Rev. J. Hewlett, with an Illustration by T. H.—The Ruined Human Dwelling; by Richard Howitt—The Smugglers; by the Mountaineer—A day at Cambo, &c. &c.

London: HENRY RENSHAW, 356, Strand.

Price SIXPENCE, free by post SEVENPENCE.

The Lancet,

Of Saturday last, OCTOBER 26, contains:—

A COURSE of LECTURES on the OPERATIONS of SURGERY, and on Diseases and Accidents requiring Operations, delivered at University College, London, in the Session of 1844, by ROBERT LISTON, Esq. (Lecture X.):—Tumours of the upper and lower Jaw.
A COURSE of LECTURES on ORGANIC CHEMISTRY, delivered during the Winter Session, 1844, in the University of Giessen, by JUSTUS LIEBIG:—Certain Compounds of Carbon—Carbon and Oxygen—Carbonic Oxide, and its Combinations.
ORIGINAL PAPERS:—On Diseases of the Heart, with Cases. By John W. Tripe, Esq.—Fracture of the Costal Cartilages and Rupture of the Vena Cava. By Richard Pyper, Esq.—On the Successful Treatment of Conical Cornea. By F. B. Gervis, Esq.—The Discovery of Uric Oxide in Guano—Method of obtaining Hippuric Acid from Human Urine. By L. M. Midwives' Midwifery. By T. Litchfield, Esq.—On Albuminuria; its existence during Puerperal Convulsions: its Pathology. By G. Ross, Esq.
The Government Medical Bill.—Birmingham General Hospital.—College of Surgeons of England—By-laws relating to the Professional Education and Examination of Candidates for the Fellowship.
REVIEWS:—Treatise on Inflammation as a Process of Anormal Nutrition. By John Hughes Bennett, M.D.
THE GOVERNMENT MEDICAL BILL:—Meetings of the Medical Profession: Brentford Medical Association; Medical Protection Assembly; Wrexham; Chester; Tower Hamlets; Sheffield.
Medical Society of London: Effects of Medicines.—Causes of Abortion.
Westminster Medical Society: Opening of the Session.—President's Address.—Fatal Case of Poisoning with Carbonate of Lead.—Effect of Lead on the Gums.—Doses of the Acetate of Lead.
MISCELLANEOUS LETTERS:—The Operation at the Jervis-street Hospital, Dublin.—Birmingham General Hospital.—Education of the Sons of the Faculty.—Royal Free Hospital.—News of the Week.—Books received for Review.—Mortality Table.—Apothecaries' Hall.—Correspondents.

London: JOHN CHURCHILL, Princes-street, Soho; and may be had of all Booksellers and Newsmen.

NOW READY FOR DELIVERY,

JOHNSON AND SHAW'S FARMERS' ALMANAC AND CALENDAR, for 1845, 220 pp., and 100 Engravings of the best Agricultural Implements, with their prices and Makers' names, &c., &c. Price only 1*s.*; also,

1. JOHNSON'S TRACTS for Agricultural Schools, Cottage Farmers' Assistant, Farmers' Calendar, and Agricultural Chemistry, 1*s.* each.
2. A New and enlarged edition of JOHNSON ON MANURES, price 16.
3. VON THAN'S PRINCIPLES OF AGRICULTURE. Translated by C. W. JOHNSON, Esq., F.R.S., and W. SHAW, Esq., in 2 vols., price 25*s.*, cloth.
4. MORTON ON SOILS. A New edition, enlarged. price 1*s.*
5. SQUAREY'S AGRICULTURAL CHEMISTRY for the Practical Farmer, 5*s.*
6. SINCLAIR ON GRASSES AND WEEDS OF AGRICULTURE, 45 coloured plates, 30*s.*

JAMES RIDGWAY, Piccadilly, and every Country Bookseller.

OBTAINABLE FOR NOTHING.—The Nervous are respectfully invited to send to Rev. Dr. WILLIS MOSELEY, 9, Charlotte-street, Bloomsbury, London, for the small Pamphlet just published, on his most successful treatment of Nervous or Mind Complaints, by which he cures these Diseases as certainly as water quenches thirst, which Pamphlet he will return, if a stamp is inclosed, free of charge.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London, and published by them at the Office, No 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, November 2, 1844.

The Newspaper.

SATURDAY, NOVEMBER 2, 1844.

LIFE ASSURANCE.—The following are specimens of the low Rates of Premium charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Age	20	30	40	50	60
Annual Premium	£1 10 3	£2 0 7	£2 15 3	£4 1 8	£6 3 9

and of these Premiums one-third may remain unpaid, in the hands of the assured, at interest to be deducted from the sums assured, when they become claims.

Persons assured to the amount of £500 for the whole term of life participate in the profits of the Company. Subscribed Capital £200,000.

For Forms of Proposal and other particulars, apply at the Office, 126, Bishopsgate-street, corner of Cornhill, City.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their Establishments, 22, Regent-street (corner of Jermyn-street), or 45, Moorgate-street, City. New goods Plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the kingdom and abroad free.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS AND DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

NETTING for SHEEP FOLDS, made of Cocoa-nut Fibre, a material known to possess the most extraordinary durability when exposed to alternations of weather. A prize was awarded for this Netting at the meeting of the Royal Agricultural Society at Bristol, in 1842; and it is strongly recommended to the notice of Agriculturists in the Society's Report for that year. It will wear out several sets of tarred hemp Netting, and is so light that a herdsman can with ease carry 200 yards of it.—Sold in nets of 50 and 100 yards long, 42 inches high, by the Manufacturers, WILDEY and CO., 7, HOLLAND-STREET, Blackfriars-road, London.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON and Co., West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co." under a crown. Old articles replated and gilt.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

News of the Week.

THE opening of the new Royal Exchange by the Queen in state, for which such extensive preparations have been making for some time past, took place on Monday with all the ceremonies incidental to such an occasion. On the importance of this event to the city of London, and to the vast commercial interests which it represents, it is unnecessary for us to dwell. Nearly three centuries have passed away since Queen Elizabeth bestowed the name of Royalty upon the foundation of Sir Thomas Gresham, and identified the peaceful triumphs of British commerce with the glory of her Crown. That commerce has now filled the world, and another Queen has held her Court in a new and more magnificent palace of her merchant princes. The details of a ceremony so significant of the power and resources of the country will be read with interest by all classes; and there are few who will not join in the hope expressed by the Address of the Corporation, that the new building may endure for ages, a memorial of the commercial grandeur and prosperity of the empire.

From France we learn that the projected reform of the Spanish Constitution is the leading topic in Paris, and the journals of all parties, with one or two exceptions, anticipate a popular movement in Spain as the result of such extensive changes. The Republican party openly declare that these innovations have been made at the instance of the French Government, with a view to their adoption in France at some future opportunity. The Cabinet of M. Guizot on Tuesday entered the fifth year of its existence, a longer tenure of office than any Cabinet has enjoyed since the Revolution of 1830. Accounts from Algeria state that a serious insurrection has broken out in a part of the country which had not submitted to the authority of Marshal Bugeaud, before he started for Morocco. The movement was quite unexpected, and the French troops were compelled to retreat with considerable loss.—In Spain the projected reform of the Constitution has taken all parties by surprise, but the precautions adopted by the Government to ensure majorities, leave no doubt that the bill will be carried. The opponents of the measure merely make it a question of time, offering no objection to the destruction of privileges which have always been considered the bulwarks of Spanish liberty, but suggesting only whether it shall be done now, or deferred to a more favourable opportunity.—From the United States, we learn that the elections throughout the Union are engrossing public attention, and that, on the whole, the return of Mr. Clay as President is all but certain. In Canada, the elections have led to great excitement, and the junction of the Irish and French parties has caused some embarrassment to the Government of Sir C. Metcalfe. Some disturbances took place at Quebec on the arrival of the news of Mr. O'Connell's acquittal, and great excesses were committed by the Repeal party.—By the Calcutta mail we have news from that presidency to the 18th September, and from China to the 29th July. The accounts from India are not important, and the new Governor-General is taking advantage of the tranquil state of the country to make himself master of the details of his office. Another riot broke out at Canton on the 15th July, the Chinese having forced themselves into the company's Garden, and attacked the English and American factories. The Chinese authorities were either unable or unwilling to check the rioters, and the disturbances were not suppressed without the assistance of the military.

Home News.

COURT.—On Saturday the Queen and Prince Albert took their morning walk in the grounds adjacent to the Castle, and promenaded in the afternoon in the Slopes and Home Park. The Prince went out shooting in the course of the morning. On Sunday morning Her Majesty, Prince Albert, and the suite, attended Divine service in the private chapel of the Castle, and soon after 5 o'clock left the Castle for town by the Great Western Railway, arriving at Buckingham Palace shortly before 7. On Monday the Queen went in state to open the Royal Exchange, accompanied by Prince Albert and the great Officers of State. After the ceremony Her Majesty and His Royal Highness returned to Windsor by the Great Western Railway. On Tuesday the Queen took her usual walks, and on Wednesday took exercise on horseback in the Riding-school. On Thursday the Prince came to town, and after visiting the new Summer Temple in the gardens of Buckingham Palace, transacted business at the office of the Duchy of Cornwall. His Royal Highness returned to the Castle in the afternoon.—The visitors to the Queen this week have been Sir J. Graham, the Earls of Ellenborough and Liverpool, Sir R. Peel, Sir Robert and Lady Sale. The Hon. Harriet Paget and the Hon. Georgiana Liddell have succeeded the Hon. Misses Murray and Kerr as Maids of Honour in Waiting on the Queen. The day fixed for Her Majesty's visit to Burghley House, the seat of the Marquis of Exeter, is said to be the 12th inst. Her Majesty it is stated will stand as sponsor to the infant daughter of the Marquis, the christening having been arranged to take place during Her Majesty's visit. It is reported that Her Majesty intends paying early visits to the ducal seats of Strathfieldsaye, Arundel Castle, and Goodwood.

Ministerial Changes.—It is reported that Lord Haddington is about to retire as First Lord of the Admiralty on account of ill-health, and that Lord Ellenborough will be his successor.

Order of the Garter.—Her Majesty has conferred the Garter, vacant by the death of the late Duke of Grafton, upon the Earl of Powis, who is also mentioned as likely to succeed Lord Heytesbury as Lord-Lieutenant of Ireland.

Order of the Bath.—It is announced in last night's Gazette that the Queen has been pleased to appoint the Earl of Ellenborough to be a Knight Grand Cross of the Bath—Colonel Dennis, of the 3d Foot, with local rank of Major-General in India, and Colonel Valiant, of the 40th Foot, with local rank of Major-General in India, to be Knights Commanders of the Bath.—Lieut.-Colonel E. J. Smith, of the Bengal Engineers, and Lieut.-Colonel J. C. Drummond, of the Bengal Native Infantry, to be Companions of the Order.

Baronetcy.—The *Gazette* of Tuesday announces, with the date of Oct. 28, that the Queen has been pleased to direct letters patent to be passed under the Great Seal, granting the dignity of a Baronet of the United Kingdom of Great Britain and Ireland unto the Right Hon. William Magnay, of Postford House, in the county of Surrey, Lord Mayor of the city of London, and the heirs male of his body lawfully begotten.

Duchy of Lancaster.—Lord Granville Somerset, Chancellor of the Duchy of Lancaster, has appointed Mr. Horace Twiss to the office of Vice-Chancellor of the County Palatine, with a seat in Her Majesty's Council of the Duchy, in the room of the late Mr. Holt. For three years past, in consequence of the law officers of the Crown not happening to practise in the Courts of Equity, Mr. Twiss has been the acting Attorney-General in those Courts.

Sir William Follett.—Dr. Bright, the gentleman whose professional services have been devoted to the Attorney-General since his departure for Italy, returned to this country on Saturday, leaving his patient at Milan in greatly improved health. Sir William does not intend to return to England before February.

Foreign.

FRANCE.—The Paris journals are for the most part taken up with the proposed modification of the Spanish Constitution, and, with one or two exceptions, anticipate from it a popular movement. The Republican prints are of course indignant at the proposed innovations, and their party generally declare openly, that "those changes were made at the instance of the French Government, with a view, if they succeed, to imitate them in France whenever the opportunity presents itself." We must add, however, that even the *Journal des Débats* expresses, though with reserve, disapprobation of the proposed changes, and regrets that the Spanish Government has not occupied itself with practical reforms rather than with general speculations.—On Tuesday last, being the anniversary of the accession of the present Ministry to office, all the Members of the Cabinet dined with the King at St. Cloud. The Ministry has entered its fifth year.—The *Débats* has an article on the refusal of the Court of Aldermen of the city of London to admit Mr. Salomons, that gentleman being unwilling, as a Jew, to make the declaration required by law. In concluding this article it says, "Such anomalies in our age are a disgrace to the legislation of a free country. It is an honour to France to have long ago effaced from her laws these vestiges of intolerance and oppression. Our political bodies, our civil functions, are open to all religions and all classes. France may well console herself at not having, like England, certain liberties which touch even upon licentiousness, in knowing that she has the most sacred of all liberties—the liberty of conscience."—The official papers announce that Commodore Bruat, Governor-General of Oceania, has just received the Legion of Honour from the King. They also state that a serious insurrection has broken out in Algeria, at about 12 leagues from Dellys, in a part of the country which had not submitted to any of the three *agalicks* established by Marshal Bugeaud before he started for Morocco. A letter from Algiers, of the 20th, published in the *Siècle*, says there were 130 of the French killed and wounded, of whom 15 were officers. 35 men and 2 officers were killed. The insurrection was quite unexpected, for General Comman had, during the previous month, sent troops through all the districts in the neighbourhood of Dellys without meeting with the slightest resistance. On the 15th, however, he wished to go among a tribe called the Flessat-el-Baher, where it was suspected that a turbulent chief, of the name of Bel-Kassem, had taken refuge, and organised a resistance to the French. He there found several redoubts built of dry stone, which he determined to attack. The redoubts were taken at the point of the bayonet, but, although he had a considerable body of troops under his command, he found himself ultimately obliged to retreat. The retreat is said to have been made in good order, but the enemy followed so close that 12 men of the rear-guard were killed and 2 officers wounded. At all events, the French army retreated in all haste to Dellys, which they reached without once halting, although the distance is 40 miles. Immediately on hearing of the affair, Marshal Bugeaud left Algiers with four regiments which had just arrived at Algiers from Morocco. The number of the Kabyles is estimated at 7000 men. The number of French engaged in the affair was 1500 men. Marshal Bugeaud has carried with him a reinforcement of 2000. A letter from Algiers of the 14th inst., mentions that a report daily gains credit, that the Duc d'Aumale is to be appointed Viceroy of Algeria, and that Marshal Bugeaud, when he reaches France, will be consulted by the Ministry, who are anxious to ascertain his opinion upon a subject of so much importance. The *Moniteur* publishes three royal ordinances, dated St. Cloud, 25th inst.—the first confirming the adjudication made by the Minister of Public Works to MM. Laffitte, Blount, and Co., of the Amiens and Boulogne Railroad; the second confirms the adjudication of the railroad from Orleans to Vierzon, with branches to Chateauroux and Bourges, to MM. Bartholony, Benoist, & Co.; the third royal ordinance confirms the adjudication of the railroad from Orleans to Bordeaux to MM. Laurent, Luzarche, Mackenzie, and Co.—It is understood that the French Cabinet, after long hesitation, has at length determined upon effecting the loan for 300

million of francs, which has been so long expected. It was expected that the ordonnance to that effect would be published in the official papers of Sunday.—The *Revue de Paris* states that the King, on quitting Windsor, had given orders for a sum of 50,000 f. to be distributed amongst the servants of the household, but on its being observed to him that Queen Victoria had only given 25,000 f. at Eu, His Majesty, from a sense of propriety, ordered that the same amount should be given in his name.—The *National* states that an Envoy of superior rank is about to be dispatched by the Minister of Commerce to London, to conclude the negotiations relative to a treaty of commerce commenced by M. Guizot when at Windsor.—The long-expected promotion in the peerage of France has at length taken place. The number of new peers is 15, of whom none are members of the Chamber of Deputies. The names best known among the promotions are, the celebrated Victor Hugo; M. Martel, formerly a member of the Chamber of Deputies; M. Delessert, the brother of the Prefect of the Seine; and Count Jaubert, a former member of the Thiers Ministry. The complete list of names has not yet been published. It is supposed that soon after the meeting of the Chambers a further promotion will take place, and upon that occasion it will be confined to members of the Chamber of Deputies.—Violent storms have lately produced considerable ravages in the south of France. In Marseilles the inundations were so great, that the water rose above the carriage wheels in the streets. In Toulouse a terrific storm visited the town on the 24th ult. At Avignon and other towns, the Rhone, the Durance, and the Saone had overflowed, and committed considerable ravages. A letter from Cette, near Montpelier, gives an account of a dreadful storm and whirlwind which visited that town on the 22d ult., and did a vast deal of damage. The Government establishment of engineers, a very large building, was utterly destroyed, even the walls not being left standing. The zinc roof of the building was carried into the air, and broken into thousands of pieces, which fell in different parts of the town, where they did a great deal of injury. Several other large buildings were destroyed, and the place is described as resembling a town which had undergone the horrors of a siege. At the same time a storm prevailed in the harbour, which wrecked and sunk six or seven large merchant vessels, besides a great number of fishing and other boats. The number of persons who perished is calculated at about 30, but the exact number was not known, and numbers were still missing whose fate was uncertain. A great number besides are severely wounded from the falling houses, and even at the time when the accounts came away the people were afraid of a renewal of the disasters, as the storm was not yet over. This unlooked-for calamity had created the utmost distress and alarm.—Paris letters express fears that the prediction of M. Arago, that "the impending winter will be the coldest known for many years," is likely to prove correct. The *Constitutionnel* states that the mountains in the neighbourhood of Chambery are covered with snow, and that the same appearance was observed in the neighbourhood of the Pyrenees.—The question as to whether the heart of St. Louis was really contained, as reported, in the box found on the 15th of May, last year, in the Sainte Chapelle, has been finally set at rest. It is decided that the remains in that box are not those of St. Louis, and they have been restored to the place from which they were taken.

Spain.—We have accounts from Madrid to the 26th ult. The Government plan for the reform of the constitution is the sole topic of the day, and its boldness appears to have taken all classes by surprise. The sitting of the Chamber of Deputies of the 18th was invested with much solemnity. The whole building was filled. Among other persons present were the Ambassador of France, the Ministers of England and Naples, and the Chargés d'Affaires of Belgium and Denmark; the Duke of Glucksberg (on his way to Morocco), M. de Broglie, and M. Garnier Pages. The six Ministers were present in costume. Before reading the new Reform Bill General Narvaez uttered a few words, explaining that in consequence of very serious reasons laid before her by her Council of Ministers, the Queen had determined upon presenting the Bill of Reform in the Constitution. After going over the articles of the bill he entered into a lengthy explanation of the motives which had called for it, and of the spirit in which it was conceived. After this speech the Chamber assembled in the different sections in order to nominate the committee for the Address. This preliminary operation produced a better result than was expected. The discussion in the sections was lively, and referred chiefly to the fourth paragraph of the speech of the Throne relative to the electoral system. Of the seven Commissioners, one only, M. Isturitz, was hostile to the proposition, as inopportune. His opposition, it seems, was attributed to the disappointment he experienced in seeing himself unsupported by the Government in his desire to obtain the Presidency of the Cortes. The sections were to meet again on the next day in order to nominate the committee upon the Constitutional Reform Bill. This, it was expected, would give a better idea of the opinions of the members of the Chamber on this important question, although there is little doubt that the Government will succeed. In the seven sections into which the Chamber is divided, all of which have to make a report on the subject, the whole of the reporters are in favour of the Government, and if the decision in the sections could be taken as a true indication, the Government will carry its measure by a majority of 2 to 1. Even the opposers of the project, at the head of whom M. Isturitz has put himself, do not object to the proposed "reforms" as being bad, retrograde, or destructive of liberty, but merely as being inopportune. They all concur in their determination to destroy the constitution of 1837; and the only question is whether it shall be done now or at some more favourable opportunity. M. Isturitz, who wished the reform to be postponed till after the other business of the Legislature was got through, has spoken very warmly in the committee in favour of a postponement, and has determined, it is said, to bring forward a motion on the subject, which, according to the regulations in the Spanish Cortes, must be discussed before the main question. The first important debate in the Chamber will, therefore, be upon this motion. The bill relative to the demand of the Government to legislate freely upon matters connected with the *ayuntamientos*, provincial deputations, political governments, and provincial councils of administration, had been sent to a committee of the Senate nominated for that purpose. The Senate on the 25th concluded the discussion on the Address, and adopted almost unanimously all the paragraphs of the report. In the course of the debate, M. Martinez de la Rosa, in alluding to the case of Don Carlos, declared that nothing could be done until he had submitted to and acknowledged the present Government; but that he could never be allowed to return to Spain with the airs of a conqueror. He said the Government were aware of the conspiracies formed by the Carlist and Exaltado party both at home and abroad, and had taken every measure to prevent the intrigues of both. This speech seems to have excited considerable sensation. The Minister of Finance, it was expected, would present his budget to the Cortes in a few days, with the announcement of several important measures of financial reform. Some of the papers give a most alarming account of the revolutionary projects in various parts of Spain, and especially in Catalonia; but it is represented as the general tactic of the revolutionists to say in the provinces that all is ripe for a movement in Madrid, and in Madrid that all is ripe for a movement in the provinces. It would appear, however, from the correspondence intercepted upon General Ametler, that a revolution menaces the country, for the purpose of re-establishing Espartero, and overthrowing the Queen. A letter from Perpignan of the 19th states that orders were given on that day for the formation of a cordon upon the frontiers. This measure, it was supposed, was connected with the movement and subsequent arrest of several Spanish refugees upon the frontiers of Catalonia. It appears that the news of the arrest which had taken place upon the frontiers of Catalonia of several influential persons attached to the Progresista party, had produced considerable sensation in Madrid, inasmuch as it gave a certain weight to the reports of the expected movement. Letters from Valladolid state that a vast conspiracy has been detected there, the object of which was to proclaim the constitution of 1812, and to protract the Queen's minority four years more. The conspirators, most of them military men, are stated to have been seized and thrown into prison, and General Lemerich, ex-Governor of Madrid, who was in that city under surveillance, has effected his escape.—The jury summoned to try the *Espectador* paper for an article published in it on the 15th August last, have declared, amidst much applause in the court, that there was no reason to proceed against the paper. The palace of Buen Vista, which it appears has been given up to Don Manuel Godoy, Prince of Peace, has been sold by him to Senor Salamanca for four millions of reals, being purchased on account of Queen Christina, who will reside there with M. Munoz, after the acknowledgment of their marriage. It is said that the Government engages to bring in a bill to secure her dotation as Queen Dowager with the title of Majesty. Even in the capital, however, much dissatisfaction is expressed at the marriage of the Queen-Mother, which is also viewed with disapprobation by her daughter, Queen Isabella. It would seem, in fact, from all that has appeared on the subject from Madrid, Paris, and other quarters, that the influence of Queen Christina is at an end.

Germany.—Accounts from Berlin of the 21st ult. state that the Prince of Prussia was then in so satisfactory a state that no more bulletins would be issued. The Berlin journals of the 19th publish a ministerial order abolishing the granting of licences for marriages within any of the degrees of consanguinity forbidden by the law. They say also that during his recent stay at Berlin, Lord Palmerston had openly and forcibly expressed how much the invading tendencies of Prussia were contrary to the English interests, and that the Prussian papers had all combined in accusing him of a want of delicacy in the manner in which he had uttered his opinions. They also mention a report that the King of Prussia is about to emancipate the Jews. A letter of the 21st states that "The King has just granted permission to M. Gneist, one of the professors of the royal university of Berlin, to open a course of lectures on the nature and operation of trial by jury. This measure has given great satisfaction to the public, as it looks like the announcement of an intention to introduce, at no distant period, into western Prussia, the institution of the jury, which exists in the Rhenish provinces." A Frankfort journal announces that M. Pezyluski, Administrator-general of the diocese of Gnesen, has been elected Archbishop of Posen.—The *Revue de Paris* states that the invitation given by the Court of Austria to His Royal Highness the Duc d'Aumale extends also to his brothers.—The papers state that the clergy of Treves, not content with the devotion excited by the holy garment in their possession, are now endeavouring to recover one of the nails which is said to have transfixed the feet and hands of our Saviour. It appears that this nail, which formerly belonged to the Treasury of Treves, has fallen, it is not known how, into the hands of Prince Metternich. The Bishop of Treves consequently is now in negotiation with the Austrian Minister.—A letter from Dresden of the 13th states, that the remains of Carl Maria von Weber, who died at London in 1826, had been interred in the Catholic cemetery of that city.—A royal ordinance in Bavaria has again reduced the price of beer in the Royal breweries, and thus once more contrived to calm the public mind, which was already in a state of considerable excitement.

Holland.—The ordinary Session of the States General was opened on the 21st ult. by the King in person. The speech from the throne alluded with satisfaction to the political relations of the country, and to the sacrifices made by the people for the reduction of the public debt, by which a considerable saving had been effected. Improvements in commercial legislation, and the reform of the monetary system, were mentioned as subjects for the consideration of the States. The King afterwards nominated the President of the first Chamber, and the second Chamber commenced its proceedings by examining the validity of elections.

Belgium.—The German papers state that objections have been made by England to the treaty of Belgium with the Zollverein, and that the British Minister at Brussels had declared to the Belgian Government, that every new concession of the kind would be looked upon by the British Cabinet as a formal act of hostility to England.—The Minister of Finances has just presented to the Chamber of Representatives the budget of receipts and expenditure for 1845. The receipts are estimated at 111,198,170 francs, and the expenditure at 109,961,790 francs, showing a surplus revenue of 1,236,380 francs.—A letter from Frankfort of the 22d mentions a report that the Emperor of Russia is about to recognise the independence of Belgium, and to establish diplomatic relations with that country.

Switzerland.—The Grand Council of Lucerne, on the 24th ult., after a warm debate, which lasted from 8 in the morning till 7 in the evening, resolved to recall the Jesuits, and intrust them with the education of the people, by a majority of 70 votes to 24.

Sweden.—The affairs of Sweden begin to create a sensation in the political world. The four Estates have in the present Diet, and partially in the late one, separated into two bitterly adverse parties, the nobles and the priesthood being in opposition to the citizens and the peasantry; and the result has been a conflict to which it is not easy to foresee an end, except through the interposition of the King.—Letters from Stockholm state that the King of Sweden has demanded the authorisation to concede to a foreign Power, which is not named, and under most disadvantageous conditions, the island of St. Bartholomew. In making this demand the King remarked that this colony was onerous rather than useful to the resources of the country, and proposed that until the Diet should have decided upon this point, the island should be administered by the Department of the Finances instead of by the Crown. St. Bartholomew is one of the small Antilles Islands, situated to the north of Guadaloupe. It has a population of 5000 inhabitants, and its capital is Gustavia. Its port, which is open to large vessels, is excellent. It has belonged to Sweden since 1784, when it was ceded to that country by France.

Russia.—Letters from St. Petersburgh state that the Emperor has been so violently affected by his grief, occasioned by the loss of the Grand Duchess Alexandra, that his health has been greatly shaken since that event. Leeches have been applied three several times. The Emperor lives in a state of complete isolation, and pays no attention whatever to public affairs. His temper has been also much embittered. His state of health naturally produces a very deep and painful impression in St. Petersburgh.—Steam navigation is daily making great progress in the Russian empire. The Baltic fleet numbers 17 steamers; the Black Sea 13, and 5 for the service of the ports; on the Caspian there are 4. There are likewise steam-boats on the Neva, the Wolshow, the Duna, the Dnieper, the lake of Peipus, and the Kama. Even in Siberia there exists a steamer, upon Lake Baikal.

Turkey and Egypt.—We have accounts from Constantinople to the 7th ult., and from Alexandria to the 6th. In the night of the 2d, Pera, which has so often suffered by fire, was again visited by a conflagration. It broke out in the quarter built of wood, and spread towards the north-west, and was not got under till it had raged for eight hours. The great street of Pera owes its safety chiefly to the long stone wall of the building belonging to the Russian Legation. The lowest estimate makes the number of houses reduced to ashes 200, the highest 400. We need not wonder at the difference, the streets and lanes, with few exceptions, being without names, and all the houses without numbers.—The King of the French has sent a splendid doll, worth 10,000f., to the Sultan Abdul Medjid, as a present for his daughter Maime, now four years old.—We learn from Belgrade that the Minister of Foreign Affairs in Servia has given in his resignation, and been succeeded by Petroniewich, who filled the post before his exile.—From Alexandria we learn that Mr. Bourne, who has been sent to Egypt by the London Post-office authorities to make arrangements with Mehemet Ali for the transit of the India mails through Egypt, has had several conferences with Artin Bey, the Prime Minister. Artin Bey went up to Cairo to receive the Pasha's instructions concerning this object, and, although the nature of the arrangements in progress is not known, it is said that they are not proceeding

ing, between the hours of 7 and 8, a fire broke out in an extensive range of premises in Finch-lane, Cornhill. A great mass of flame was seen to issue through one of the windows. An instant alarm was raised, and engines from the neighbouring stations promptly attended. A good supply of water being at hand, the firemen and inhabitants set to work, and the fire was confined to that part of the building in which it originated, and in less than half an hour was completely extinguished. It was exceedingly fortunate that the fire was so easily subdued; had it only extended to the houses at the back, it is probable that the new Royal Exchange would have suffered.

The Lord Mayor Elect.—It is stated by the *Times* of Wednesday that a suggestion has been made for the purpose of compelling Alderman Gibbs to resign the office to which he has been elected. It says it is proposed that the bankers, corporate bodies, insurance companies, and, in a word, all persons desiring to preserve a reputation for probity, should, by one address or varying addresses, request him not to act as Lord Mayor until the pending suits in which he is engaged are determined. It states, that no harm can arise from such a postponement, for which the alderman has no one but himself to blame; for if he be proved virtually innocent, the honours paid him afterwards will be more sweet, because unmixed with tainted influences. The *Times* adds that a remark fell on Monday last from the lips of a distinguished guest at Her Majesty's table in the Exchange, which appeared to meet with general acquiescence. On his being informed that Alderman Gibbs had not ridden on Monday in the civic procession, it is stated that a cabinet minister observed, "that a man who could not venture to meet public opinion, was unfit to fill the office of Chief Magistrate of London."

Court of Aldermen.—A Court was held on Tuesday at which the thanks of the Court were voted to the Lord Mayor, Sir William Magnay, Bart., for his judicious conduct and arrangements at the opening of the Royal Exchange, and for his exertions in sustaining the dignity and privileges of the Corporation. Mr. Moon was also sworn in as Alderman of Portsoken Ward, under a protest from Mr. Salomons.

New Legal Association.—On Wednesday a meeting of members of the legal profession was held at the Gray's Inn Coffeehouse, for the purpose of electing officers and taking the requisite steps to constitute the Society. Sir G. Stephen presided, and in opening the business of the meeting observed, that in the discharge of their duties as attorneys, the profession were admitted to that confidence which it would be vain and useless to commit to others. It was the common interest of both attorney and client to retain that inviolable professional secrecy by which alone the interests of both could be promoted. One who acts as an attorney must dive into the inmost recesses of domestic privacy. They must become acquainted both with the political, commercial, and Parliamentary details of their client's claims. Under those circumstances, he thought that the institution of a new association of members of the legal profession might be considered to be a new era, so far as they themselves were concerned. The means whereby the members of that profession had gained a livelihood have been attacked, and therefore it became necessary for them to form an association in their own defence. In saying thus much, it became his duty also to say, that they were bound to correct the malpractices both of those in the profession and of those who were not qualified. He then read the rules and regulations of the Association, and said he was most anxious to maintain the respectability of the profession, and to insure honourable conduct on the part of its practitioners. In his opinion, the greatest reform that was necessary to give respectability to the profession was to look strictly after those persons who adopted sharp practice. Mr. D. W. Wire, in a speech of some length, disclaimed any wish to interfere with any other legal association, and concluded by moving the adoption of the rules read by the chairman. After a good deal of discussion, and some modification, they were adopted, and the various officers of the institution appointed.

Destitution in the Metropolis.—On Wednesday a protracted inquiry, adjourned from Friday last, was resumed before Mr. Wakley, M.P., on the body of William Hall, formerly a footman at Seven Oaks, whose death took place under very melancholy circumstances. It appeared that deceased, together with his wife and four children, in consequence of their deep distress, were, at the recommendation of a friend, placed by Messrs. Williams and Carpenter, house agents, of Old Burlington-street, in the care of the house, No. 6, Stratford-place, lately the residence of Sir T. Troubridge. They lived in the kitchen, and for the last nine weeks had lived upon nothing but dry bread and potatoes. The wife of the deceased, whose appearance presented the very picture of starvation, stated that deceased died on Wednesday night. She had applied about a month since to Marylebone workhouse for relief, and half-a-crown was given her on the inspector seeing the destitute state in which deceased and her children were; but at the same time they told her that if she applied again they must be passed to their parish, which was in Huntingdonshire. On account of this, knowing that she could not get employment there, she had not applied since for relief, except for a medical order to get medicine for deceased. On the day deceased died she had not a farthing in the house, and her children were without a meal. The relieving overseer and inspector admitted that on giving deceased the half-crown they told her they must be passed to their parish, but said that they were, in so doing, acting strictly in accordance with the law of settlement. The coroner said, when a person obtained a medical order, from that moment the parish authorities became responsible for the care of the recipient. The law of settlement was, in many cases, the cause of death, and he hoped that another year would not pass before it was repealed. Messrs. Quain and Clarke, the surgeons who had examined the body, stated that although great destitution was exhibited, the immediate cause of death was rupture of the aorta, which, from the deceased's debility, had burst. The coroner again expressed his determination to bring the matter before Parliament, and hoped he should have the assistance of the jury, and the parochial authorities generally, in doing so. The jury acquiesced in the views of the coroner, and ultimately returned a verdict in accordance with the general evidence. The coroner said that since the distress of the poor woman had been made known, he had received several sums of money for her, and trusted that she would never again fall into such a dreadful state of misery.

The National Gallery.—On Tuesday this Exhibition was re-opened to the public, having been closed during the last few weeks for the purpose of examining the various works of art contained therein, and making the necessary repairs. During the recess, all the pictures have been either cleaned or varnished. The late purchases, the Guido and Rubens, from the Penrice collection, now appear in all their splendour. The Francias are now seen in perfection, and no picture has undergone a more thorough change than the "Brazen Serpent," by Rubens, which had probably never before been cleaned from its smoke and varnish since its arrival in England. It is now, in a manner, resuscitated, and presents a noble specimen of the master. The Hogarths have been varnished, and are in the most perfect state; the cracks in the Wilkies have been carefully mended, and the pictures brought out in all their effect. The rooms have been thoroughly cleaned and repaired, and the blinds and ventilators put in order. It is to be feared, however, that the return of summer dust and the breath of crowds will again obscure the brightness of these fine paintings, and probably ere long this result may convince the public that a larger place is necessary for the accommodation of both pictures and spectators than is afforded in the present building. The cleansing of the pictures has been intrusted to Mr. Seguier and Mr. Brown. The rooms on Tuesday were much crowded, and the improved character of the Exhibition appeared to give the greatest satisfaction to the visitors.

Westminster-bridge.—On Monday this bridge was again thrown open to the public. The acclivity of the carriage-way has been reduced in the centre, and the hollows filled up both on the Middlesex and Surrey ends, the latter of which was previously so dangerous, and it now assumes a gradual inclination almost as level as Waterloo-bridge. The foot-pavement is now much higher than the road, but the foot passengers are protected from danger by strong wooden posts, through the tops of which pass a continuous line of long iron bars, all danger from falling into the road being thereby entirely prevented.

Oxford-street Wood Paving.—On Saturday considerable sensation was created in the Marylebone Vestry, in consequence of a notice of motion having been given, calling upon the vestry to renew their contract for three years with the Metropolitan Wood Paving Company, for keeping in repair and cleansing that portion of wood paving laid down by them between Wells-street and Rathbone-place. After a very stormy discussion, a division was demanded, when there appeared for the resolution, 21; against it, 23; majority, refusing to enter into the contract, 2.

Old Streets Newly Named—On Thursday, at a vestry of the parishioners of St. Bride's, Fleet-street, it was resolved to change the name of Water-lane, Fleet-street, into Whitefriars-street. The street was the boundary on the east side of the Monastery of Whitefriars, and a short time ago, while excavating for a sewer, the foundations of the wall were discovered the whole length of the street, at a great depth. Cateaton-street also has been named Gresham-street, and the end houses labelled accordingly.

Departure of Professor Liebig.—On Saturday the students of University College assembled in the theatre, for the purpose of inviting Professor Liebig to a dinner. Though the matter had only been broached the evening before in the presence of 35 students, 30 of them instantly subscribed a guinea each, and a committee was appointed to arrange the affair; but unfortunately Professor Liebig was obliged to leave this country on Thursday, for Germany. The Professor delayed his departure in order to be present at the royal entertainment on Monday last, on the occasion of the opening of the Royal Exchange. It was in contemplation in various quarters to have given him a public entertainment; but, being necessitated to officiate at the Giessen University, where the lectures commenced a week ago, he was obliged to decline the pressing invitations he received from several scientific bodies.

Wesleyan Missions.—On Wednesday evening, the annual meeting of the London Wesleyan Missionary Society was held in Jewin-st. Chapel, Alderman Challis in the chair. An unusually large attendance took place in consequence of an announcement that Mr. Pritchard would be present, and would give some information on the subject of the late differences in Tahiti. The chairman at great length set forth the advantages of such meetings, as far as the interests of religion were concerned, and eulogised the exertions made by the Wesleyan body in the propagation of Christianity among the heathen. The report stated that the Wesleyan Missionary Society had 400 missionaries labouring in foreign parts, besides 6000 agents. The receipts of the city of London Association had been 230*l.* 1*s.*, being an increase of 95*l.* over the receipts of last year. The report having been adopted, Mr. Pritchard spoke at considerable length, dwelling chiefly on the rapid spread of religion in Tahiti and the other islands of the Pacific. Amongst those who had contributed to this success were the Wesleyan missionaries, to whom great praise was due for the manner in which they discharged the duties devolving upon them. Mr. Freeman, from Ashantee, also detailed the progress of religion there. A vote of thanks to Alderman Challis concluded the business of the evening.

The Forgery of Bank of England Notes.—On this subject the *Brussels Gazette* says:—"We would put our readers on their guard against an extensive forgery of notes of the Bank of England for 100*l.* sterling each, at present in circulation in Belgium and other parts of the Continent. These notes are so well imitated as to baffle the closest inspection. We have heard of 700*l.* of the said forgeries having been cashed by a money-changer, at Brussels, and 200*l.* in Antwerp; but the Bank has acted in the most liberal manner, by having already liquidated nearly the whole amount of these, and it is probable they will do the same with regard to the others as they come in, that can be proved to have been taken in the regular course of business. The person who duped the said parties is apparently a Frenchman of small stature, with a good address, but unprepossessing look, and an agent of the bank has come over in pursuit of him." We learn from *Galignani* that a man called Lindor is considered to be the principal agent in the forgeries. He appears to have effected his escape from Paris, as he did from Brussels and London, after having got several of the forged notes exchanged; yet if precaution had been used, he would have been captured in Paris. On the 21st inst. he exchanged a 100*l.* note at the shop of a money-changer named Bouchon, who soon afterwards took it to Madame Emerique, of the Palais Royal. That lady, by her experience, has acquired more knowledge of English notes than the minor changers, and she appears to have had a suspicion of the note presented to her by M. Bouchon, but gave him change for it, on his endorsing it, by way of guarantee to her, in the event of its proving a forgery. In the evening Lindor again called upon M. Bouchon to exchange another 100*l.* note, but M. Bouchon told him that he had not at the moment as much French money, but if he would leave his address he would take him the money on the following morning at nine o'clock. At the same time M. Bouchon mentioned that some doubt had been expressed of the genuineness of the note which he had cashed. Lindor gave an address (a false one, of course), and said he would not trouble M. Bouchon to call with the money, but would call himself at 9 the next day. He did not present himself, but sent a letter, in which he said that his wife had been so much agitated at the mere supposition that a forged note could have got into his hands, that she had miscarried, and was at the time so alarmingly ill that he could not leave her. This was a mere trick to gain time, for it was supposed that M. Bouchon would have no suspicion of his being about to quit Paris under such circumstances. It was not until the 25th that official accounts were received here of the forgeries, and by that time he had disappeared. It is understood, however, that Mr. Lawson, the solicitor, has received instructions to follow up the affair, and it is by no means improbable that all the parties engaged in it may be apprehended. Lindor is said to be a native of Holland.

The Convicts Barber and Fletcher.—Many of the daily papers state that in the vessel which took out the will-forgers, a fever has broken out to which several of the crew and convicts have fallen a sacrifice, and among others Barber. He has, it is said, left behind him some important memoirs connected with the extraordinary will-forgeries.—In reference to the above paragraph, the *Times* of Thursday states that they have received a letter from the owner, inclosing the following extract from one written by Captain Nealby, of that vessel, dated Aug. 7, lat. 11 10 N., long. 26 W.:—"I am happy to say we are getting on tolerably well, although not very fast. We have buried a child and one soldier since we left." An evening paper, after quoting the paragraph, says:—"On inquiry at the Home-office we were informed that no intelligence whatever had been received on the subject, and that the report was not credited."

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Oct. 26: West Districts, 151; Northern, 149; Central, 167; Eastern, 193; Southern, 275; Total, 935. Weekly average for the last five years, 946.

Provincial News.

Bristol.—The Great Britain steam-ship is at length released from her protracted confinement. The necessary alterations in the upper lock leading from Cumberland Basin into the float having been made, she was on Friday evening, between 6 and 7 o'clock, removed from her moorings on the Sea-banks, and proceeded down the floating harbour to the entrance of the lock, where she remained for the night, and on Saturday morning at 7 o'clock she was brought safely through the lock into Cumberland Basin, where she will remain for a few days to have the screw affixed, &c. It is then intended that she shall make one or two trial trips, after which she will proceed to London.

Chatham.—A fatal accident, connected with the siege operations, occurred here on Wednesday. It appears

that a charge of 25 lbs. of gunpowder had been fired in the right branch of Lieut. Penrice's counter-mines with a smaller charge of about 5 lbs., and some loose powder. After air had been pumped into the mines for some time, three men entered the branch where the explosion had taken place, for the purpose of digging out the loose earth. In a few minutes one of them came out of the mine, saying that the foul air so affected his head that he could not stand it any longer. The others not making their appearance, some alarm was excited, and two men entered the mine in search of them, when they found them lying at the further end of the branch in a senseless state. One was got out, when one of the second party fell senseless, completely choking the passage. Some delay occurred in extricating him, and when that was effected, Lieut. Muggeridge, who was in charge of the party, led his men in to rescue the last, and found him lying on his face at the extreme end of the branch. He was immediately got out, and a surgeon of Brompton being sent for, was promptly on the spot, and applied remedies, but without effect, as, owing to the delay in getting him out, he was quite dead. The poor fellow's name was Sullivan. Several of the party who entered the mine the last time were more or less affected, and the Lieutenant himself was partially delirious for some minutes after he came out. Immediately after the accident, all further operations on the works ceased, and it is understood that they will be totally abandoned.

Carmarthen.—We regret to state that last week Major-General Sir W. Nott was taken alarmingly ill, and is still in a precarious state. The road before his house in Guildhall-square has been covered with litter, to lessen the sound of passing vehicles.

Dover.—The two men named John and William Clarke, for whose apprehension Government offered some weeks since a reward of 70*l*., in the belief that they were concerned in the recent murder of the policeman at Dover, were captured last week. They were discovered by means of an incautious expression of their sister while making purchases in a shop. They stated that they had been living in the woods since the occurrence, but strongly denied any participation in the murder. They were taken to Dover, and on Friday last were committed to Maidstone gaol to take their trial.

Liverpool.—The annual dinner of the Liverpool Agricultural Association took place on Tuesday week, after the usual exhibition of stock and implements. Lord Stanley presided on the occasion, and was supported by the Earl of Sefton, Lord Lilford, the Mayor of Liverpool, and a large number of the landed proprietors and farmers of Lancashire and Cheshire. After the usual loyal toasts, Lord Stanley proposed "Prosperity to the Association," and adverted to the merits of this and similar institutions, in promoting the important objects they are designed to serve.

"Those objects," he said, "are of a two-fold character, not only important as they tend to increase the facilities and the cheapness of cultivating the soil of this country, and rendering it more adequate to meet the daily increasing wants of a rapidly augmenting population, by the application of improved science and art to the limited surface of the earth over which we have command, but still more important in their bearing upon our social relations, bringing together all classes of the community, landlords, tenants, of a higher and lower class, and even the labouring classes also, and combined, as I am happy to see them on this and similar occasions, in this locality, with representatives of the great manufacturing, mercantile, and trading classes. The general advantages of societies of this description are so universally recognised, and recognised practically as well as in theory, that it would be an idle and impertinent waste of your time to take it up by any discussion of them. In every quarter of the kingdom we find, within the last few years, societies similar to this have been springing up, and agriculture is partaking of the great movement which has been pervading all the industrial branches of this country. Farmers are finding out that it is necessary for them, with a view to their own interests, to take a very different course from that which was followed by their grandfathers and great grandfathers. In these days no man is allowed to stand still. Improvement must go on. And I see throughout the country, in every part of it, gratifying proofs that improvement is going on, as actively in the agricultural as in the manufacturing districts and operations of the country. Even within the last four or five years, I see strides which, small as they may be compared with what might be done, are gigantic when compared with what was done before. I think it is not more than four or five years ago, that at a meeting of the Royal Agricultural Society of England, I first noticed as a novelty of a singular character a new manure, known as guano, and recommended to the agriculturists of England. If I am not misinformed, from this single port of Liverpool there have gone out, within this single year, no less than 156 vessels, chartered expressly for the purpose of importing this then unknown manure for the improvement of the agriculture of the country. It is not alone, however, in matters like this that we see the usefulness of these societies. I look for much more extended and permanent improvement from their operation. Everywhere I see old and useless fences disappearing, fields enlarging, improved modes of cultivation adopted; and I see going on with immense rapidity that which I must again and again impress upon you who are connected with the land is the basis of all improvement—deep and thorough drainage of the land; and not here alone, but throughout all England, I see most remarkably, as indeed any one may do, even though whirled through the country at the railway speed with which we are now carried, what an extent of improvement has been effected in this respect. Every one is struck with the appearance of preparation for future exertions, which are, at the same time, the token of well-deserved success. Some of the old farmers of this country, I mean the real old class, shrug their shoulders, and say, 'What is the need of all this stir about improvement and making the land grow so much more?' By the bye, it is not so much making it grow more as making it grow different crops, making it grow Wheat instead of weeds. But some say, 'What is the use of all this? It is not a question for the farmer. We shall only have our rents increased the more productive land is.' Such an argument, allow me to say, is the very climax of absurdity. To use a very homely phrase, it is 'cutting off one's own nose to spite one's face.' 'Why should I undertake an improvement because my landlord will benefit by it?' appears to me a very inconclusive and absurd argument. I am not here to dispute the fact, that every improvement in value, every addition by science to the productive power of the land, everything which adds to its fertility, must, in the long run, be an advantage to those in whom the fee-simple is vested. But the question is, at the same time that it is an advantage to the landlord, is it not also an advantage to the farmer who occupies the land and makes his livelihood out of it? I ask no man to undertake an improvement if his own good sense does not lead him to do it. I ask no man to apply any improved mode of cultivation if it does not appear that his own individual advantage would be promoted by so doing. But when farmers argue, that because at the expiration of their tenancy their rents may be increased, it is not worth while to adopt improvements, I must say, they take a very short-sighted view of their own interests, and must think their landlords very great fools and blockheads. They must go on the presumption that although he sees his land might be made more productive, he will be satisfied, for the purpose of seeing his own rents low, to allow a slovenly tenant to go on with his slovenly courses. The landlord would be as short-sighted as the tenant if he could take such a view as this. But again I say, I want the tenant not to undertake any improvement that will not repay him, capital, interest, and profit, during his occupation of the land. This brings me to another question, as to the degree to which it is desirable or important that the practice should prevail of holding land by lease. I speak, I know, in the presence of a noble friend of mine, and every man who knows him is aware that there is not a kinder or better landlord, or a warmer friend to his tenants and neighbours than my noble friend on my left, the Earl of Sefton. I know also it is not my noble friend's practice to let his farms on lease. The great majority of his tenants are tenants from year to year, with such entire and perfect confidence in the honour and integrity of their landlord, that I do not believe that the fact of their having no lease operates disadvantageously in any individual case. But this I say—and as one connected with the land I feel myself bound to say it—that a landlord has no right to expect any great and permanent improvement of his land by the tenant, unless that tenant be secured the repayment of his outlay, not by the personal character or honour of his landlord, but by a security which no casualties can interfere with—the security granted him by the terms of a lease for years. I do not speak of a lease for lives. In my experience, with some exceptions, wherever I have found fields badly cultivated, and buildings unrepaired, I have found that the property is held under a life-lease. I speak of a tenant who is prepared to join his capital, and go hand in hand with his landlord, in the improvement of the farm. The greater the improvement you expect, the greater ought to be the lease you give. I consider it unjust, if you call for improvement, not to give to the tenant the moral certainty that the improvement he effects shall repay him during the course of his lease for the expense he incurs. I will go further than this, and say that there are some expenses of so permanent a character, that while I repeat it again that it is an inadmissible argument against improvement, if the tenant repays himself for his outlay, that at the expiration of his term he shall leave his land in a better state than he found it—while I hold this to be an inadmissible position, and admit and contend, that in proportion to the amount of improvement expected from the tenant ought to be the duration of his lease—I will add further, that there are some expenses, more especially with the class of farmers of whom the great majority are composed, which it is idle to expect that they should undertake. If they are to add a permanent value to the land, they ought to be undertaken by the landlord himself, charging on the tenant such an amount of interest as may repay him for the outlay he has made, and at the same time afford a reasonable profit to the tenant. But, gentlemen, I am not speaking now except of that which I am practically conversant with, and given proofs of my adherence to in practice. I allude especially to that which again I repeat is the basis of all improvement, and especially in this country—the thorough draining of the soil. And I repeat what I have already said on a former occasion in this room, that there is no investment in the world in which a landlord can so safely, so usefully, or so profitably invest his capital as in the improvement of his own farm, by money sunk in draining, on security of the land which belongs to himself. I think I give you a tolerably practical proof of my conviction on this point when I say—and I say it, not for the purpose of boasting of what has been done, but of encouraging others to follow the example—that on my father's property in this neighbourhood there has been laid down at his expense, and charging five per cent. interest to the tenants, which I believe they most gladly and willingly acknowledged they have over and over again received the benefit of—in this last year we have laid down in deep draining somewhere about 300 miles of drains, at an expense of between 5000*l*. and 6000*l*., and I think employed about a million and a half of draining-tiles. By the arrangement I recommend for this purpose both parties are benefited: the landlord receives an ample return for his outlay; he knows the work is done in a substantial and workmanlike manner; and I will venture to abide by the declaration of any tenant on that property whether the additional amount per acre he has incurred by having his fields drained, has not been over and over again repaid by the annual return arising from the property. It may be thought that I have trespassed on your indulgence, on a point peculiar and personal to myself, at greater length and in more detail than I was justified in doing. But this is an occasion on which we should freely speak our minds to each other. We meet together as landlords and tenants, and it is right that we should express frankly our own opinions. I do not hesitate to express mine, as to the mutual duties of landlord and tenant, and the mode by which I believe they may effectually combine together for the advancement of the important objects in which both are at least equally interested. I believe, on the whole, I am in a position to congratulate you on the present state of this society. I hope the period of its depression is already passed. Undoubtedly it has been subject to some vicissitudes, and experienced some losses; and two or three years ago it became involved in debts from which some exertions were necessary to relieve it. If, however, I might hazard such an observation, I would say, anxious as I am for its increasing prosperity, it might be of advantage if its sphere of operations were more extended; and if the co-operation and consent of another and similar society in this county could be obtained, great benefit might be derived from the amalgamation of the Manchester Society with the Liverpool. I believe if the union were effected, it would tend to the mutual advantage and increasing prosperity of both. With these observations, and thanking you for the patience with which you have listened to the remarks of one very little competent to address you on such subjects, I beg of you to join me, as I feel you will do cordially and heartily, in drinking 'Prosperity and success to the Liverpool Agricultural Society.'—The Earl of Sefton, amid loud cheers, proposed the health of the Earl of Derby.—Lord Stanley returned thanks, and proposed the healths of the Vice-Presidents, Lord Sefton, Mr. Robertson Gladstone, and Mr. Watt.—Lord Sefton and Mr. R. Gladstone returned thanks.—Lord Stanley then said the members of the Society would recollect that in former years the wall behind the President's seat was covered with silver articles for distribution among the successful competitors, and that it formed a very imposing array. In the course of time, however, some of the successful competitors—or he ought rather to say their wives, finding they had got so many teapots and teaspoons that they knew not what to do with them, suggested to their other halves that it would be more desirable to get the amount of their prizes in money, in order that they might buy the teapots and teaspoons themselves if they liked. It had been therefore decided that all the premiums should be given in money, and with the permission of the company he should now proceed to read over the names of the successful candidates, to whom the Secretary was he believed prepared to meet all demands in full, if any of the competitors desired then to receive the amount. His Lordship then proceeded to read over the list of prizes, occasionally making such remarks to the successful candidates as were calculated to encourage them to renewed industry and perseverance. When he had gone a considerable way through the list, his Lordship said he now came to a class of rewards for long and faithful services, which he always perused with the liveliest feelings of pleasure. He availed himself of the opportunity to express the deep regret with which he had lately seen one of the newspapers of this country, commanding an extensive circulation, endeavouring to decry this species of rewards, as if they were payments for long and faithful service. He hoped the labouring community would feel that they were not put forward in any such degrading manner. They were not payments, neither were they given by way of recommendation, but by way of marking, from those classes of society who had the best means of judging of their merit, the sense they entertained of the honour which those persons in humbler circumstances had done the society, by a long course of honest and faithful conduct. They were not therefore a degrading, but they were an honourable mark of approval, of which any man in any class of society might well be proud. He held in his hand a testimonial which was to accompany a premium of 4*l*., to be given to Jonathan Hughes for 25 years of faithful servitude. The 4*l*. to such a man would be as unworthy a remuneration as a piece of paper; but the testimonial itself would be kept by him and his children as a proof that his long and faithful services had been appreciated by those among whom he lived. He then proposed the health of the right hon. Lord Lilford, as a warm patron of Agriculture, and coupled with the toast the Agriculturists of Northamptonshire.—Lord Lilford briefly returned thanks. "The Judges," "the Mayor of Liverpool," the "Successful Candidates," "the Committee of Management," and "the Lancashire Witches," were the remaining toasts of the evening.

Manchester.—The Anti-Corn-Law League opened their winter campaign in this town last week. Mr. Wilson presided, and gave a long account of the proceedings of the League during the last ten weeks, and the results of the registration. Mr. Cobden afterwards addressed the meeting, and ridiculed the landed gentry for visiting the towns and lecturing the people upon agricultural pursuits two and a half hours in the year. He next ridiculed the practice of the agricultural associations in granting prizes, and asked what would the people of Manchester think if an association were to give them prizes for the best workman, the best spinner, the best piece of fustian, and the man who kept the cleanest shop-floor, &c.; because it all amounted to the same thing as the prizes at the agricultural associations. He animadverted upon Lord Stanley's boast at the Liverpool agricultural meeting, that he and his father had laid down 300 miles of draining-tiles within the last year. He believed that Mr. Bright had been building a cotton-mill, and had during that time been laying down a million and a half of bricks. The landed gentry would be puzzled if Mr. Bright were to glorify himself after having admitted that "it was the most favourable investment that man could make." He wished Mr. Bright would calculate the duty which he had to pay for his bricks, for it was certain that Lord Stanley paid none for his tiles. Mr. Bright next addressed the meeting in a discursive speech, embracing a variety of topics, but principally directed against the aristocracy, and the evils of monopoly.

Portsmouth.—The two experimental squadrons, which sailed from Portsmouth last week—the one on Tuesday, and the other on Wednesday morning—are not to cruise together as has been stated, but are to form two distinct squadrons: the brigs under the command of Commodore Corry, of the Firebrand steam-frigate, and the line-of-battle ships under the command of Rear-Admiral Bowles, who has hoisted his flag on board the Caledonia, 120, for the occasion. The brigs have proceeded direct to the westward, and will be kept at sea for six weeks or two months; and the line-of-battle ships have sailed for Lisbon, where they will be joined by the Albion, 90, and afterwards cruise to the westward of the Western Islands. In passing down Channel the squadron of brigs was accompanied by the Xarifa (the Earl of Wilton's), belonging to the Royal Yacht Squadron. A trial of sailing was made between the whole of the vessels composing the squadron, including the Xarifa, with the wind nearly aft. After a run of 36 miles with a moderate breeze, and all sail set, with studding-sails alow and aloft, this trial terminated by the Flying Fish and Pantaloon, both constructed by the Surveyor of the Navy, beating the other vessels by nearly a mile. Her Majesty's steam-yacht Victoria and Albert is to be taken into dock for the purpose of giving Dr. Reid an opportunity of making some alterations in his ventilating apparatus, which is found at present to be very inefficient. Should the contemplated alterations not prove satisfactory, the whole of the apparatus will be removed, and that of Dr. Arnott substituted. —The French cutter La Favori, 8 guns, came into this harbour early on Monday morning with presents from His Majesty Louis-Philippe for various officers at this port, London, and Windsor, and despatches for Admiral Sir C. Rowley from the French Minister of Marine. On entering the harbour she saluted the Port Admiral with 17 guns, and the British ensign with 21; the former was acknowledged from the Excellent, and the latter from the platform. The cutter having landed her treasures, left the harbour on Tuesday on her return.

Ripon.—The Leeds *Mercury* states that the Duke of Devonshire has announced his intention of disposing of his extensive estates in the neighbourhood of Ripon, situated at Marton-le-Moor, Rainton, and Baldersby, by private contract, in one purchase, that the several occupants of the respective farms have received notice of his Grace's intention, and that ample recompense will be made to the tenants for the improvements they have made on the estate.

Stafford.—Another colliery explosion of a fearful character occurred in the southern division of this county, on Saturday week. The pit in which it occurred belongs to Mr. Joseph Darby, and is situated near the Five Ways, Rowley. In the mine the men are employed in getting thick coal of the best quality. The mine, it is understood, has long borne the character of being one of the most dangerous in the neighbourhood; but Mr. Darby, the proprietor, has resorted to all the various

satisfactorily, and that neither party can agree on the principal points. Mr. Bourne had been up to Cairo for a few days, and expected to have this affair finally terminated by the 20th, for the return of the English steamer. The French Consulate is earnestly watching Mr. Bourne's proceedings, and there is no doubt that they are acquainted with all the details. The scientific Prussian mission, under Dr. Lepsius, was on the 20th September at the Island of Phile. Dr. Lepsius has terminated his travels in Ethiopia, and was on his way to Thebes, where he intends to spend the winter, and expects to return to Cairo in the spring. Everything is quiet in Egypt. Mehemet Ali is still at Cairo, where he at present enjoys excellent health.

United States.—The mail steamer Caledonia arrived at Liverpool on Wednesday, with news from Boston to the 16th, and from Halifax to the 18th ult. The elections in the various States entirely engross the papers; those of New Jersey and Ohio had resulted in the return of Whigs, and in Pennsylvania the majority for the democratic governor was so small, that on the whole, the return of Mr. Clay as President was all but certain.—The third Mormon war is ended without bloodshed; and at the last accounts the troops were on their way home. On the 30th Sept. the Governor held a treaty with the individuals against whom writs had been issued for being engaged in the killing of the Smiths, and after considerable negotiation, the matter was finally settled to the satisfaction of all concerned.—The election of Mr. Anson Jones as President for Texas, in place of Gen. Houston, the friend of annexation, and in opposition to Gen. Burleson, also the advocate of that measure, had excited some surprise and, amongst a certain party in the United States, a good deal of vexation. The new President is opposed to the annexation movement, and friendly to what is termed the British interest.—The affairs of Mexico wear an unsettled appearance. Santa Anna has had some misunderstanding with the Chamber of Representatives, and has solicited leave to retire for a time. General Canligo was spoken of as his successor *ad interim*. Brazil was busily engaged in fitting up some war ships for the relief, it is believed, of Montevideo, and to prevent it falling into the hands of the Buenos Ayreans.—Canada is the scene of considerable excitement, arising out of the elections, and the junction of the Irish and the French parties in the province, both opposed, of course, to the government of Sir C. Metcalfe. Rumours prevail that Papineau, who is now in France, was about to return. Quebec exhibited some disturbance on the occasion of the Repeal party celebrating the triumph of O'Connell; they burned tar barrels in honour of the event, and smashed the windows of several houses which did not exhibit lights in commemoration of it.—The dates from Rio Janeiro are two days in advance of those which have come direct by the government packet. The *Journal do Commercio* contains an account of a rupture between the commander of the British brig of war Alert, Capt. Bosanquet, and Capt. Dumas, of the brig Cyrus, of New Orleans. It appears that when lying off Calinda, on the coast of Africa, the British captain came alongside of the Cyrus, and suspecting her to be a slaver, demanded to see the brig's papers. This the American captain refused, and at length the box or chest containing them was broken open, and the documents were examined by the captain of the English vessel, the master of the suspected brig protesting against the proceeding in loud and indignant terms. It is added that after the British captain had left the Cyrus she was sold to the Portuguese, and immediately filled with slaves. During the altercation, and before the sale, the British captain is reported to have said to the American, "The reason you cannot show me the papers is, because you have sold your vessel—I was told so." The American captain's version of the affair is evidently exaggerated, and contains a great deal of bombast, such as the "American flag trampled upon by the British," "our flag is insulted, it will cost the English nation dear," &c., and he accuses the English captain of being a coward and turning pale! His letter is published in the American papers, with imposing capitals and notes of admiration. The writer evidently calculated on the morbid jealousy of his countrymen respecting the right to search suspected slavers carrying the American flag, and the language in which he indulges, however ridiculous it may appear on this side the Atlantic, has made, and will continue to make, some stir on the other side.

India and China.—By the Hindostan, which left Calcutta on the 18th September, we have news from that presidency to that date; and from China to the 29th July. The country at that period of the year being usually quiet, the intelligence by this arrival is not of much interest. The new Governor-General has commenced his reign by availing himself of the opportunity afforded him by the peaceful state of the country, to become thoroughly acquainted with all the details of his office, and to master the great political questions which he knows will have, sooner or later, to be actively dealt with. The excitement occasioned by the recall and departure of Lord Ellenborough has subsided; but the feelings of the army are still strongly in his favour, and the subscription for the testimonial to him is going on increasing. The state of the Punjaub is, on the whole, satisfactory, as regards its relations with the British Government; but it is still a prey to internal commotion. With respect to the mutinous state of certain regiments of the native army, it appears that although the mutinous spirit may not yet be eradicated, it has been sufficiently checked to be prevented from spreading beyond the infected corps, and is certainly much abated even in them. Mr. Bird, deputy-governor of Bengal, being about to return to England, it is supposed to be the intention of the Governor-General to abolish that office, and to take the government of Bengal upon himself. A numerous meeting of the native gentry and inhabitants of Calcutta and its neighbourhood had been held, for the purpose of expressing the sentiments of the native community towards Mr. Bird, on the occasion of his retirement from office and India, at which very complimentary resolutions were passed. In Scinde there has been again some fighting with the Beloochees, and the advantage was with Captain Mackenzie and the English. Advices from Cabul mention that an engagement had taken place on 2d August, between Ackbar Khan and Aubdool Summund, in which, after a good fight, the former came off the victor. Lieut. Mackintosh, late Aide-de-Camp to Lord Ellenborough, and subsequently in charge of the Mysore princes, has died from the effects of fever. Capt. M'Lean succeeds him in charge of the Mysore princes.—From the Chinese papers we learn that disturbances had again taken place at Canton. The English last year repaired the walls of the Company's garden, which had been broken down at the fire in 1842. They put on a gate, and were in the habit of walking, playing at quoits, and otherwise amusing themselves. On the 15th July the Chinese endeavoured to force themselves into the garden, but were opposed. Upon this they threw brickbats, and broke down the gate, compelling the Englishmen to take refuge in a boat, in which they made their escape to the Consulate. On the following evening a party of Chinese went armed with brickbats, and attempted to take possession of the other garden. Resistance being offered, they commenced an indiscriminate attack upon all the foreigners who came within their reach. Several American gentlemen immediately armed themselves, and drove them from the front of the factories. Still continuing to throw brickbats, they were fired upon, and one man killed and another wounded in the arm, which ended the affair for the day. The English and American Consuls applied to the Chinese authorities for a sufficient force to protect the factories, and a message was sent to the American man-of-war at the Bogue, to request assistance. Intelligence of the 21st informs us that no further rioting had taken place, nor was any likely to occur at present, though it was quite certain that the authorities at Canton were either unable or unwilling to adopt measures sufficiently vigorous to check the riotous disposition of the commonalty.

CITY.

Money Market, Friday. — This day was observed as a holiday at the Bank and Stock Exchange, being the 1st of November, one of the two days appointed in the year for making up the transfer books of the English Stocks. On Thursday Consols left off 100 buyers for Money, and 100⅛ sellers for account; Bank Stock 203 to 204; India Stock, 287 to 289; Red. Three per Cents., 99⅜ to ¼; New Three and a quarter per Cents., 102 to ⅛; India Bonds, 92 to 94 pm.; Exchequer Bills, 67 to 69 prem.

Gazette of the Week—Bankrupts.—B. B. and B. G. Owen, Pallmall, tailors—T. Benson, 12, North-place, Gray's-Inn-road, and of 108, Gray's Inn-lane, stationer—J. Mitchell, Montague-street, Montague-square, liverystable keeper—R. Elliott, Durham, draper—J. C. Ross, Savage Gardens, City, merchant—R. Morgan, 13, Ampton-street, Gray's Inn-road, carpenter—P. French, Worthing, Sussex, carpenter—M. Martin, Bristol, upholsterer—T. Pretty, Bilston, Staffordshire, grocer—J. Johnson, Liverpool, merchant—W. Chandler, Minories, chemist—T. Goldsworthy, Clifton Villas, Maida Vale, merchant—W. Brooke, Mincing-lane, city, coffee dealer—C. Pitt, Bristol, victualler—A. Robertson and L. H. Folger, High-street, Shoreditch, upholsterer—R. Owen, Manchester, provision dealer—W. B Bridrick, Durham, dealer in iron.

Bankruptcy Annulled.—J. Harling, lately of Middop, Yorkshire, farmer.

Scotch Sequestrations.—J. Towart, Rothesay, grocer—R. Dickson, late of Annan, but now of Glasgow, nurseryman—J. Grahame, Edinburgh, wine-merchant.

Metropolis and its Vicinity.

Opening of the New Royal Exchange.—The opening of the new Royal Exchange by Her Majesty Queen Victoria, an event so important in the annals of the City of London, has been accomplished under the most favourable auspices, without any accident to mar the solemnity and pleasure of the day. The weather was most propitious, and the sun during the whole day shone brightly on the pageant. At an early hour the streets were thronged with carriages and groups of pedestrians hastening to the places they had secured to witness the procession, while those who were more favoured proceeded to take their positions within the Royal Exchange. In the suburbs were seen crowded omnibuses and coaches adding to the stream that was pouring from all directions towards the line of streets through which Her Majesty would pass. Detachments from nearly every division of the metropolitan and city police mustered in the streets, and formed in lines on each side of the road, about nine feet apart. Nearly every shop was fitted up with seats, and before 9 o'clock many of them were occupied. In those parts of the town distant from the line of procession the shops were generally closed, it being the determination to make the event of the opening of the new Exchange the occasion of a general holiday. Before 8 o'clock numbers of persons had assembled round the Palace and in the Park, to occupy the best positions for seeing Her Majesty pass. Files of soldiers and policemen were placed along the Mall to Buckingham Palace, and a wide open space was kept clear without much difficulty, for the people, though more numerous probably than on any former occasion of the Queen's going in state, were generally very good-humoured and well-conducted, and stood back when remonstrated with by the police without opposition. A quarter before 11 was the hour stated in the official programme for the procession to leave the Palace, but more time had been allowed for reaching the Exchange than was afterwards found necessary. Eleven o'clock struck without an indication of movement, when a herald's trumpet sounded within the Court, and Lord C. Wellesley, Clerk Marshal; Major-General Wemyss, and Lieut.-Colonel Bouverie, who had the management of the procession, and had been waiting on horseback without the marble arch, rode within it to await the approach of the Queen. At this moment the anxiety became intense, and the police had the greatest difficulty in keeping the crowd from pressing forward. Another ten minutes, however, elapsed before the procession moved. First came six of the royal carriages, conveying the principal members of the royal household, each carriage drawn by six horses richly caparisoned, with two grooms in scarlet liveries walking on each side. After the sixth carriage had passed, came the Yeomen of the Guard, with their halberds and frills, and rich-looking antique costume; then twelve of the Queen's footmen, four and four, dressed in their cloth-of-gold liveries, and after them the state coach, drawn by eight cream-coloured horses, with their splendid trappings. The Queen sat with her face to the horses on the right hand side, having Prince Albert on her left. As soon as the state coach passed the line of Horse Guards, so that the people could see the Queen, they cheered most heartily, and as the procession passed along Pall Mall towards Charing Cross, the crowds of persons assembled in the windows and balconies of the shops and club-houses welcomed Her Majesty with renewed demonstrations of loyalty. Her Majesty and Prince Albert continued to acknowledge these marks of popular attachment, bowing on both sides the carriage as it moved slowly along. The state carriages of the Ambassadors fell into the line at the bottom of St. James's Street. The Ambassadors were dressed in their official costumes, wearing their several orders and decorations. The carriages thus added to the royal *cortège* were those of the Russian, Turkish, and French Ambassadors, and of the Belgian, Bavarian, Portuguese, Danish, Prussian, Saxon, and Mexican Ministers; and thus enlarged, the procession moved on towards the City. It was stated in the programme that the carriages of the Cabinet Ministers would form in the same manner as those of the Ambassadors, but the Duke of Wellington, Sir R. Peel, and other Ministers went to the Exchange previously, and did not join the procession. As the royal *cortège* passed round Trafalgar-square, and entered Charing-cross and the Strand, the general effect was splendid in the extreme. The area of the square and the steps of the Nelson column were crowded with spectators, and along the whole length of the Strand, as far as the eye could reach, a vista of waving flags, decorated balconies, and myriads of spectators were visible. The appearance of the state carriage was hailed as it passed by the enthusiastic multitudes. Nothing occurred to impede the royal progress for an instant through the entire length of the Strand. From the Church of St. Mary-le-Strand, where there were a number of seats fitted up for the occasion, a loud cheer burst forth, and when Her Majesty appeared at St. Clement Danes, the bells of that church rung out their peals. Temple-bar, in consequence of its being the junction of the royal and civic processions, and also of the ceremonial of demanding admittance into the City, was the point of the greatest attraction. The seats in the houses in the immediate vicinity were let at the highest prices, and the crowd throughout the day was very dense. About 11 o'clock, the city procession, including the Lord Mayor and Sheriffs in their state carriages, with the Aldermen and Common Councilmen in their robes, arrived at Temple-bar. The Lord Mayor and Aldermen alighted at Childs' Bank and remained there until they received notice of the Queen's approach. They then proceeded on foot to the outer Temple gates, within which they were admitted, whilst two troopers mounted guard at the entrance. Within this inclosure the City dignitaries mounted their horses, a ceremony far too solemn, as some of the wags in the neighbourhood ventured to say, to be performed in public view. In the meantime the carriages which had conveyed the members of the civic procession, proceeded through Temple-bar, round St. Clement's Church, turning towards the City, and again passing through Temple-bar in the prescribed order for preceding Her Majesty. All the arrangements in reference to the City procession as described by us last week, were carried out with one exception, that of Mr. Alderman Gibbs, who did not join the procession or appear at Temple-bar. The aldermen sat their horses far better than was previously imagined by those who had prepared themselves for some laughable occurrences. At 25 minutes to 12, the shouts of the multitude announced the approach of the royal procession, and the gates of Temple-bar were immediately closed. The required entrance having been demanded, they were, within a few minutes, re-opened, and the procession entered in the usual order observed on state occasions, the Queen being preceded by the six royal carriages drawn by 6 horses each, and containing the principal officers and ladies of the suite. After these carriages had passed a short pause ensued, and expectation was brought to the utmost when the four first horses of the eight which drew the state carriage of Her Majesty drew up within the City, leaving Her Majesty exactly under the centre of the arch of Temple-bar. A body of the Yeomen of the Guard, preceded by 12 footmen, four and four, had already indicated that the carriage contained the Queen. Her Majesty was dressed in white satin, with a stomacher, tiara, and crown of diamonds. She also wore the blue ribbon and star of the Order of the Garter. On her left sat Prince Albert, attired (out of compliment to the city of London) in the uniform of Captain-General

and Colonel of the Honourable Artillery Company. On the opposite side of the carriage were the Viscountess Canning, the Lady in Waiting officiating for the Duchess of Buccleuch, Mistress of the Robes, and the Earl of Jersey, Master of the Horse. No sooner had the royal carriage drawn up than the Lord Mayor, who, at the head of the civic procession, was waiting Her Majesty's arrival, alighted from his horse amidst the most profound silence—a silence which was not broken even by the circumstance that in the hurry his hat, with its Spanish plume of white feathers, fell on the ground. His Lordship then took the Civic Sword of State from the Swordbearer, and proceeding to the side of Her Majesty's carriage, tendered it to Her Majesty. The Queen, gently touching the hilt, assured his Lordship that it could not be in better hands, and the Lord Mayor immediately mounted his horse, and taking his place in front of Her Majesty's carriage, the whole procession moved on. The instant the Queen came within the City every breath, which before was hushed, was raised in one piercing shout of gratulation, and Her Majesty acknowledged, by repeated bows, her enthusiastic welcome into the ancient capital of her dominions. An escort of the Life Guards accompanied the state carriage, after which followed the carriages of the Foreign Ambassadors. In this manner the procession advanced through Ludgate-hill, St. Paul's Churchyard, and Cheapside, amidst continued cheering from the populace who lined the streets, and from those who filled every window in the line of its progress. It appears that the pedestrian spectators had far the best view of Her Majesty and of the persons who accompanied her. Out of the immense number of people who had seats in the various houses, it is certain that not one-fifth had the slightest glimpse of the Queen, who was effectually excluded from their view by the state carriage being a closed one. The procession reached the Royal Exchange at a quarter past 12. The company who had been invited to the ceremony, including the Duchess of Kent, the Duke of Cambridge, the Duke of Wellington, the Bishop of London, the Cabinet Ministers, and several of the nobility, had arrived some time previously, and taken their seats at the tables. The state carriage drew up at the grand portico. The Lord Mayor, who had alighted from his horse but a moment previously, here joined the members of the Gresham Committee and the Aldermen, and received Her Majesty and Prince Albert on their being handed from the coach by the great officers of state. A rather unlucky incident here befel his Lordship. A high pair of Spanish boots formed a portion of the Lord Mayor's equestrian attire. On alighting, his Lordship was anxious to divest himself of such an incumbrance, having to perform the somewhat arduous duty of preceding the Royal party round the Exchange. Several attendants were at hand, and after a sharp trial his Lordship succeeded in dislodging his foot from one boot, but unfortunately the second was not so readily removed, and repeated attempts to tear or cut it off having failed, his Lordship was compelled to head the royal procession with one boot on and one off. By some mismanagement also the Sheriffs and some of the Aldermen, who had formed a part of the equestrian cavalcade, were shut out and prevented from entering with the rest of the officials at the west entrance, and nearly 20 minutes elapsed before they could gain admission, so that these gentlemen took no part in the procession. A flourish of trumpets having announced that all was in readiness, the procession advanced, the Queen resting on the arm of Prince Albert, preceded by the Lord Mayor and city authorities, and followed by the great officers of state. On entering at the western gate the royal procession diverged to the right, and, amidst tremendous cheering, passed completely round the ambulatory, returning to the point whence it set out. They then crossed the open area, in the middle of which a carpet had been laid down from west to east, turning to the left hand upon reaching the great eastern archway, and proceeded up the grand staircase, through the rotunda or lobby, to the commercial rooms. As Her Majesty passed from the piazza under the archway the cheers died away, and there was a lull which almost seemed a stillness to ears inured to the shouts that had but just rent the air, when suddenly, and with a pleasing surprise to all, the bells of the tower—now heard for the first time—chimed out "God save the Queen," adding something of a prayerful solemnity of feeling to the turbulent outburst of popular fervour. Her Majesty seemed deeply affected by the grandeur of the whole exhibition, for she scarcely raised her eyes from the ground, but was otherwise in her usual health and spirits. On entering the Commercial-room, which had been prepared for the banquet of the 360 principal guests, Her Majesty was welcomed with warm greetings from the distinguished company. Her Majesty and suite then crossed the vestibule or rotunda, and proceeded to the throne-room, accompanied by a deputation of 50 persons, including the Lord Mayor, Recorder, several Aldermen, and all the Members of the Gresham Committee, who ranged themselves on each side of the apartment. Her Majesty was surrounded by the great Officers of State, and having signified her will to receive the address of the Corporation, the Lord Mayor made his obeisance, and handed the address to the Recorder, who read it as follows:—

"Most Gracious Sovereign—We, your Majesty's faithful subjects, the Lord Mayor, Aldermen, and Commons of the City of London in Common Council assembled, together with the Master, Wardens, and Commonalty of the Mystery of the Mercers, joint trustees of Sir Thomas Gresham, hail your Majesty's auspicious presence in the heart of the metropolis on this renowned and favoured spot, with the liveliest sentiments of devoted loyalty and attachment. The privilege we this day enjoy of approaching your royal person under the roof of the new Exchange revives the memory of the olden time, when your Majesty's illustrious predecessor, Queen Elizabeth, vouchsafed to adorn by her presence the simpler edifice raised by a citizen, and dedicated to the commerce of the world. Your Majesty in this respect emulates the example of that great Monarch, who deemed it no disparagement of her imperial state to proclaim by the herald and to distinguish the work of a subject by the title of the 'Royal Exchange.' It is recorded in the graceful narrative of events inscribed on the foundation stone of this building, that 'the relief of indigence and the advancement of literature and science' entered into the capacious scheme of the original founder of this noble institution, and were made subsidiary to the stability and grandeur of a commerce co-extensive with the habitable globe. Yielding to that eminent citizen and benefactor of his kind, Sir Thomas Gresham, the signal merit to plan and execute at his own charge this glorious work, we still rejoice to trace the assisting hand of the City, and the ancient Company of Mercers from the earliest prosecution of the design; and our gratitude is kindled in reflecting that each memorable epoch of the Royal Exchange is marked by the solicitude of the reigning monarch to raise and to rebuild the structure from the ashes to which it has been twice reduced by the calamitous effects of fire. King Charles II. commenced the former building on the 23d October, 1667, and the illustrious Prince, the Royal Consort of your Majesty, under your Majesty's auspices, laid the first stone of the present edifice on the 17th January, 1842. Deign, therefore, Most Gracious Lady, to regard with your Royal approbation this work of our hands, the noble and well-constructed pile again raised by the citizens of London, and erected on a site rendered worthy of the objects of so vast an undertaking, to endure, we fervently pray, for ages, a memorial and imperishable monument of the commercial grandeur and prosperity, and of the peaceful triumphs of your Majesty's happy reign."

The Recorder having read the address, Her Majesty made the following reply:—

"I receive with peculiar satisfaction this dutiful address. It is a pledge of the affectionate loyalty of my people, presented on an auspicious occasion, in a place long renowned as the centre of the commerce of these realms. It delights me to behold the restoration of this noble edifice, which my royal ancestors regarded with favour, and which I esteem worthy of my care. Within the last three years, when fire had destroyed the ancient building, my beloved consort laid the new foundation, and this day I gladly celebrate the completion of the work, quickly executed, but grand and perfect in all its parts. The relief of the indigent, the advancement of science, the extension of commerce, were the objects contemplated by the founder of the Exchange. These objects are near to my heart. Their attainment will, I trust, be recorded among the peaceful triumphs of my reign; and I shall rejoice, if I am thus enabled, by the blessing of Divine Providence, to promote the prosperity and happiness of all classes of my subjects."

The ceremony of presenting to Her Majesty the mover and seconder of the address, Mr. R. L. Jones, Chairman of the Gresham Committee, Mr. Aston, Master of the Mercers' Company, Mr. Tite, the Architect, Mr. Sidney and Mr. Hunter, the Sheriffs, was next gone through; after which the Queen addressed the Lord Mayor in a few words, which, though inaudible to those around, were understood to convey Her Majesty's gracious will and pleasure that his Lordship should thenceforward bear the title and style of a Baronet. Her Majesty, immediately afterwards, turning to Sir J. Graham, directed that the necessary patents should be prepared for the admission of Sir William Magnay among the *roll* of Baronets. This proceeding concluded, the deputation retired from the royal presence, Her Majesty, with Prince Albert, the Duchess of Kent, and the Duke of Cambridge, accompanied by their respective attendants, entering a suite of apartments fronting Cornhill, which had been prepared for their reception, where they remained in privacy during a short interval. It will be at once seen that during the presentation of the address to Her Majesty in the throne room an interval must occur, which the guests in the commercial room, as well as those in the ambulatory, would find it difficult to occupy more satisfactorily than by enjoying the repast prepared for them, and accordingly at this period the company in the commercial room having taken their seats at the tables, the Rev. E. Owen, Professor of Rhetoric to the Gresham College, said grace, and the *déjeûner*, which consisted of every available delicacy, was commenced. Several members of the Gresham Committee were in attendance during the banquet, and at its close, medals commemorative of the occasion were handed round to the guests. At a quarter past 1 Her Majesty left the private apartments, and, accompanied by the Prince and the other members of the Royal Family and preceded by the Lord Mayor, entered the subscription room, where the grand banquet was laid out, the whole of the guests simultaneously rising and greeting the royal presence with loud plaudits. Her Majesty took her seat in the centre of the royal table, having Prince Albert upon her right hand and the Duke of Cambridge upon her left. The Duchess of Kent sat on the right of the Prince, and was supported by the French Ambassador the Count de St. Aulaire, the Hon. Miss Paget, Lady in Waiting on Her Majesty, occupying the extreme right of the royal table. The Countess de St. Aulaire sat on the left of the Duke of Cambridge, the Turkish Ambassador occupying the next seat, and Viscountess Canning, officiating for the Duchess of Buccleugh, Mistress of the Robes to Her Majesty, sitting on the extreme left. The above individuals comprised the whole of the company at the royal table; covers being laid for eight only in addition to Her Majesty. The appearance of the subscription saloon at this period was magnificent. The dais on which the royal table was placed, with the superb display of plate on the framework erected behind it, had a most imposing effect, and the dresses of the company, which comprised every possible variety of costume—civic, military, foreign and domestic—contributed very materially to the grandeur of the scene. The whole of the guests having taken their seats, Prince Albert intimated Her Majesty's desire for the banquet to commence, upon which the Bishop of London rose and said grace, and the banquet commenced at once, the Lord Mayor standing in attendance behind Her Majesty's chair. At 2 o'clock a flourish of trumpets announced that the time had arrived for the Lord Mayor to propose, as the first toast of the day, the health of the Queen; and in a very few moments the Common Crier gave, by the direction of his Lordship, "The health of Her Majesty the Queen of England." The guests here rose *en masse*, and cheered for a considerable period most enthusiastically, the band of the Life Guards stationed in the Rotunda playing the national anthem at the same time. The intelligence of the Queen's health having been proposed in the principal room, speedily ran through the whole building, and every guest pledged Her Majesty with hearty sincerity, the area resounding with loyal manifestations, which were distinctly audible far beyond the walls of the building. The Common Crier then gave the health of "His Royal Highness Prince Albert." It is scarcely necessary to say that this toast was received with renewed enthusiasm by the company, who pledged his Royal Highness upstanding, with all the honours. One little incident occurred here which it would be inexcusable to omit—upon the toast being announced, Her Majesty rose from her seat, and, turning towards her royal husband, drank his health, with an expression of countenance indicative of deep affection. The Common Crier gave as the next toast, "The health of His Royal Highness the Prince of Wales," which was received with loud and continued cheering. After a short pause, the Lord Mayor announced the next toast in the following words:—"I have received Her Majesty's commands to give as the next toast, 'Prosperity to the City of London.'" It would be almost impossible adequately to describe the enthusiasm with which this toast was greeted. The whole of the guests again rose, and cheered most vociferously, several minutes elapsing before the company resumed their places. Shortly before the banquet concluded, Mr. Masterman, M.P., presented to Her Majesty and the Prince two medals, commemorative of the occasion, executed by Mr. Baird, of Cornhill. Before rising from the table Her Majesty expressed her admiration of a beautifully-executed bill of fare which had been prepared for her use, and requested that it might be forwarded to Windsor Castle. It was printed in gold and colours on satin by Messrs. De la Rue, and trimmed with a border of gold fringe. A similar copy was prepared for Prince Albert, who presented it to the Countess de St. Aulaire. At 20 minutes after 2 the royal party retired from the banquetting-room in the order of their arrival, descending the grand staircase and entering the merchants' area, where the guests there located again greeted Her Majesty's appearance with loud cheers. On reaching the centre of the quadrangle, where the statue of the Queen will be erected, Her Majesty paused, and Sir J. Graham having handed to the Queen a small slip of parchment, Her Majesty, in a beautifully-clear voice, pronounced the following words:—"It is my royal will and pleasure that this place be henceforth called the Royal Exchange." Her Majesty then handed the parchment to the Lord Mayor, and, recognising Mr. Tite, complimented him on the architectural taste displayed in the building. Prince Albert also expressed his approval of the same, and astonishment at the quantity of work which had been executed since he laid the first stone in the early part of last year. Her Majesty and Prince Albert also acknowledged to the Lord Mayor and Alderman Humphery the attention shown to their convenience, and left the quadrangle amid the reiterated cheers of the guests there assembled, to receive the even more hearty greeting of the multitudes who thronged the open space in front of the building. Her Majesty left the Exchange at half-past 2, in one of the royal carriages, drawn by two horses, and proceeded at a brisk trot along the same line as the procession took into the city. The Queen's carriage was preceded by the six royal carriages, each drawn by a pair of horses, conveying the members of the household; and the *cortège* proceeded at a quick pace through the streets, amidst the cheers of the people. Her Majesty and the Prince arrived at the Palace shortly after 3 o'clock, and left town at half-past 4, by the Great Western Railway, on their return to Windsor. Thus has terminated, in uninterrupted enjoyment, the interesting ceremonial which has been the object of anxious hope for many weeks. That so large a concourse of people should have assembled without the occurrence of a single accident, is the best evidence that could be adduced of the excellence of the police and military arrangements for conducting the proceedings. In the evening the streets on the line of procession were partially illuminated, and the people, who had almost universally taken a holiday on the occasion, remained in the streets till a late hour.

The Royal Exchange.—Throughout the whole of Wednesday the vicinity of the Exchange was densely crowded by persons anxious to obtain admission to view the interior. The boys of the Blue Coat School were admitted at 8 o'clock, and permitted to pass nearly an hour in the building, the doors being thrown open to the general public at 9. From that hour until 12, and from 1 until 4, it was scarcely possible to move through the rooms, owing to the masses congregated there, so great was the interest felt to view the new building. The whole number of persons admitted was about 10,000. Placards were placed throughout the building, intimating that subscriptions would be received for the benefit of the widows and orphans of workmen who had lost their lives in the building; but many complained that it would have been more advantageous to such fund, had sixpence been charged for the admission of each person, as very few indeed turned aside to put money into the boxes appropriated for the purpose. The public have since been admitted daily, and many thousands have availed themselves of the privilege.

Fire near the Royal Exchange.—On Thursday morn-

means usually employed to prevent the occurrence of accidents, and protect the lives of his men. On Saturday morning the pit was at work as usual. The ground bailiff had been down, and with the men examined the workings, and found them all safe. About 11 o'clock, Mr. Darby being on the pit bank, and wanting some lamps, requested the butty to go down and send some up. He accordingly descended the shaft, and immediately he reached the bottom the explosion took place. There were 17 men and boys in the pit at the time, and three horses; 11 of the men were killed, and of the six who were got out alive, one is not expected to survive the injuries he received. Two of the horses were killed; the third, which was idle in the stable, was not hurt. At a depth of 16 yards below the working of the coal-pit in which the explosion took place there were at the time several men employed in getting iron-stone. On hearing the explosion above the men instantly got into an empty skip, which happened to be at the bottom, and were drawn up; had they remained a short time longer, death would have ensued from the foul air descending to the mine in which they were at work. Three horses in the same pit, which it was of course impossible to move at so short a notice, were killed by suffocation.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2729*l.*; Bristol and Gloucester, 1153*l.*; Eastern Counties, 4692*l.*; Edinburgh and Glasgow, 2208*l.*; Great Western, 17,151*l.*; Grand Junction, 8551*l.*; Glasgow, Paisley, and Ayr, 1469*l.*; Great North of England, 1980*l.*; London and Birmingham, 16,983*l.*; South Western, 6869*l.*; Blackwall, 812*l.*; Greenwich, 754*l.*; Brighton, 5173*l.*; Croydon, 444*l.*; Liverpool and Manchester, 4943*l.*: Manchester, Leeds, and Hull, 7292*l.*; Midland, 10,859*l.*; Newcastle and Carlisle, 1773*l.*; Newcastle and Darlington, 1068*l.*; Preston and Wyre, 380*l.*; South-Eastern and Dover, 5176*l.*; Sheffield and Manchester, 868*l.*; York and North Midland, with Leeds and Selby, 2645*l.*—The Railway Department of the Board of Trade have given notice that it is their intention to examine into the following schemes, in addition to those mentioned in former announcements:—1. Schemes for extending railway communication to Goole and to Great Grimsby. 2. Branches from, and extensions of, the Eastern Counties and Northern and Eastern Railways. 3. Railway communication between London and Norwich, and other schemes, in the counties of Norfolk, Suffolk, Cambridge, and Essex. 4. Branches from the Edinburgh and Glasgow Railway, Clydesdale Junction, and Edinburgh and Galashiels schemes. 5. Extension of the York and Scarborough and Hull and Selby Railways to Bridlington and Driffield. 6. Schemes for connecting Birkenhead with Manchester and Stockport. 7. South Junction through Manchester, Ashton and Stockport Junction, and Manchester and Buxton. 8. Bolton, Wigan, and Liverpool, and other schemes, in the district between the Bolton and Preston and the Liverpool and Manchester Railways. 9. Blackburn, Burnley, and Accrington, and other Railway schemes, in the district between the Bolton and Preston and Manchester and Leeds Railways. 10. Birmingham and Shrewsbury and Shrewsbury and Chester schemes. 11. Worcester and Wolverhampton and other schemes for extending railway communication in Worcestershire and Staffordshire. 12. Schemes for extending railway communications to the Potteries. 13. Schemes for extending railway communications to Falmouth. 14. Schemes for extending railway communication to Staines and Windsor. 15. Schemes for making railway communication in Ireland from Dublin to Cork, Limerick, Cavan, Galway, Enniskillen, Londonderry, and Waterford; between Londonderry and Enniskillen; between Cork and Bandon; between Cork and Waterford; between Cork and Limerick; and completing railway communication between Dublin and Belfast.—The *Times* of Monday observes that "an idea may be formed of the amount of capital employed in railway projects, when it is stated that it has been estimated that the ninety new schemes now before the public require 71,000,000*l.* as capital for their construction, upon which 4,200,000*l.* will have to be paid in calls before application can be made to Parliament. It is, however, not to be supposed that all of these will receive the sanction of Government, or that many of them, having competing interests, will be able to get the necessary amount of subscriptions. The fact, nevertheless, is sufficient to show how very extensively the mania for railway projects has taken root, and how very cautious the public ought to be in participating in it, without making every possible inquiry relative to the feasibility of the several schemes brought before them. Already, as will have been seen by the decline in the premiums of most of the favourite shares recently issued, the suspicion is afloat that the abundance of money gave this class of securities a temporary buoyancy when they first came out; but that now there is the prospect of the abundance decreasing by the opening of other channels for its employment, less inclination is manifested to support the market, and the speculators, who are the prime movers in all these affairs, seeing the result of such a state of things, have lately sold heavily to realise profit." A meeting of the York and North Midland Company was held at York on Monday for the purpose of sanctioning an application to Parliament in the ensuing session for power to enable the York and North Midland, or some other company in connection with them, to make the following lines of railway:—A line from the York and North Midland to Doncaster, one to Harrogate, another from Selby to Goole, and a railway from the York and Scarborough extension to Bridlington and Driffield; and to raise the necessary capital. Mr. Hudson, Chairman of the Directors, took the chair, and said the first project was an extension of the North Midland from Sherburn to Doncaster, the object of that being to unite that line with one which had been proposed from Lincoln to Doncaster. This extension would be 19 miles in length, thus making the whole distance from York to Doncaster 32½ miles. The proposed line was to commence at the Milford junction, and would not interfere with any gentleman's residence at all, and there was no landowner opposed to it. The next was the line to Harrogate, to which there was no opposition. It would give accommodation to Tadcaster, Hemp-ash, Wetherley, and Spofforth. The next line was Goole, which would cost 100,000*l.* The one to Bridlington, which would be 19 miles in length, would cost 80,000*l.* The Whitby and Pickering had been already purchased for 80,000*l.*, the original cost being 130,000*l.* The sum required altogether for these lines was 635,000*l.* There were 190 miles of railway, and the whole would be constructed at about 10,000*l.* per mile. The capital of the company with the new creations was 1,895,000*l.* Resolutions affirming the expediency of these lines and empowering the directors to go to Parliament were adopted unanimously.—A special train left Southampton on Monday morning at 7½ A.M., consisting of 21 carriages, laden with excursionists to witness the Queen's visit to the City on opening the Royal Exchange, with right to return on or before the five o'clock train on Wednesday.—The new act of Parliament for the regulation of fares on railways came into operation yesterday, the 1st inst. The inspectors appointed by the Government have been for some time busily engaged in visiting the different termini, for the purpose of inspecting the new third-class carriages, which have been constructed according to the act of Parliament. Those on the Brighton and Dover Railway were inspected last week: they are close carriages in the form of large boxes, 26 feet long by 10 broad, and capable of holding about 40 passengers. There is an opening on each side, which can be closed up against the weather. The rate of travelling in those carriages will be a penny per mile, so that the fare to Brighton will be 4*s.* 3*d.* The fares for the third class will be at the same rate on all the railways.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association was held on Monday, and was very thinly attended; the ladies' gallery being almost deserted, and the attendance in other portions of Conciliation Hall being very limited. Mr. Arabin, Lord Mayor elect, took the Chair. Mr. M. O'Connell opened the business of the meeting by moving the expulsion of some of the Repeal Wardens in London for disorderly conduct, and took the opportunity to correct a mistake which he had made some time since, in stating that Lord De Grey was to obtain the Order of the Garter, and in coupling with this statement some allusion to the alleged parsimony of the Noble Earl in presenting a "shin of beef" as a Christmas dinner for the inmates of the Mendicity Institution. He had received a letter from a gentleman connected with the Household (Major Parker), who totally denied the truth of that story, and entered into an explanation which fully acquitted Lord De Grey of every ground of reflection in this matter. Captain Broderick, after handing in several remittances, announced that the returns from the registries had been most satisfactory, and he considered that if the people followed up the blow which had been so happily struck, they would be in a position at the next general election to return such a number of Repeal members as would give a preponderating influence to their party in the House of Commons. The Hon. Mr. Hutchinson handed in 15*l.* from Liscarrol, and read a communication which accompanied the remittance. The letter called on the aristocracy "to take the places of honour in the patriotic agitation which was being carried on for the restoration of the nationality of their native country; if they did so, they would receive the warm-hearted blessings of the people at large, and entitle themselves to the everlasting gratitude of a generous nation." He (Mr. Hutchinson) would re-echo the sentiments contained in the letter he had just read to the meeting. Now was the time for the aristocracy to be up and stirring. He would call emphatically on them to consider seriously the actual condition of their country, and what might result from its continuance in that state. England, he was aware, was smiling at the puny efforts of these gentlemen to shake off their foolish prejudices. Such he knew were the private sentiments of every Englishman, but he knew they dared not give utterance to them in public. What did the objection of the aristocracy to join them amount to? Why, this: "We hold your opinions, but yet we cannot follow them." He regretted that the state of his health would oblige him to winter in France, and he could assure the meeting that it was to him a source of bitter mortification to leave the country at this peculiar juncture. Although, however, he would not be present *in propriâ personâ*, he would be in spirit, and he trusted that every letter he read from Ireland would give him assurance of the persevering and untiring exertions of the Irish people in their present glorious career. Under the leadership of Mr. O'Connell, they had nothing to fear. Having every confidence in his wisdom and discretion, he would caution his countrymen against being led away by any side-winded doctrines which might be propounded to them. He would be wanting in courtesy if he departed without tendering to the Association his unfeigned gratitude for the kindness they had shown him since his accession to their ranks. Mr. M. O'Connell moved, and Capt. Broderick seconded, a vote of thanks to the Hon. Mr. Hutchinson, which was carried unanimously. Mr. M. O'Connell then denounced the Ribbon system, which he declared to be atrocious and infernal. "Let the shepherds of the people know," he said, "that the wolf is on the walk." He said that arms had been shipped at Glasgow for Ireland by the Ribbonmen, and exhibited a paper which had fallen from the pockets of some Ribbon emissary in Dublin, but which proved to be a certificate of admission into an Orange Lodge. He warned the people against being seduced by such miscreants. The meeting was subsequently addressed by several gentlemen, who handed in contributions; and at the termination of the proceedings Mr. M. O'Connell announced the rent for the week to be 475*l.* 15*s.* 3*d.*—The newspapers contain the announcement that "the national collection for the O'Connell Tribute of the present memorable year 1844, will be made simultaneously on Sunday, November 17, in all the parishes of Ireland." An address has been put forward by the trustees of the Tribute, Sir John Power, Bart., and Mr. Cornelius MacLoghlin, stating the fresh claims of Mr. O'Connell upon the gratitude of his countrymen. A long letter appears in the *Freeman's Journal* of Monday, from Mr. John A. O'Neil, in which he endeavours to defend Mr. O'Connell in his recent retrograde movement in favour of federalism. Mr. O'Connell continues to enjoy much sport with his beagles at Derrynane. Several gentlemen, says the *Kerry Examiner*, some from India, Poland, Germany, and other parts, have lately visited the Abbey, and were received with true Irish hospitality, and without distinction of class or creed.

Mr. O'Connell has published a long manifesto in the *Pilot* of Wednesday, directed chiefly to an article in the Conservative *Warder* on the state of parties in Ireland. The object of the letter is to effect a junction of the Protestant and Catholic parties. After quoting several passages from the *Warder*, Mr. O'Connell proceeds as follows:—"We say that this co-operation ought to be in a spirit of equality amongst all sects, persuasions, and parties—'neither submitting itself to the other's power, friendly, brotherly, but independent.' We insist that the movement should be made with the grandeur and harmony of justice, and that justice alone can make its results permanent, happy or secure. We do not desire the restoration of the constitution of Ireland upon any other basis but that of perfect justice to all—to every sect, persuasion, and party; no partiality—partiality is necessarily injustice—the strife of factions must be put down by the constitution of the Irish Parliament, or that constitution is totally worthless, and would be despicable and odious. For my part, I feel that my first duty is to combine the people of Ireland — all the people of Ireland — in our peaceable, legal, and constitutional struggle to restore to Ireland her domestic Legislature, without which there is no prospect before us but of increasing misery and accumulating discontent. Protestants of Ireland! non-Repealers! we hold out to you the hand of perfect conciliation, and there is a heart in that hand. In conclusion, I beg to give notice that I will propose a series of resolutions the next day I am able to attend the Association, resolutions embracing all the sentiments, and embodying as many as possible of the words in the paragraphs which I have cited from the *Warder*. In the mean time, let us all adopt the great principle upon which conciliation should be founded—Justice to all, partiality to none."—A meeting was held on Wednesday of the members of the Dublin Total Abstinence Society and others, to augment the "Mathew Fund," by a subscription. The Rev. Dr. Spratt presided, and the meeting was addressed by Mr. M. O'Connell, and other gentlemen. A letter from Mr. O'Connell, strongly recommending the subscription in favour of Father Mathew, was read, and the sum of 50*l.* was collected in the room. A subscription was opened at Nenagh on Mondey, in aid of the Mathew Fund, when nearly 30*l.* were made up. Lord Dunally presided at the meeting, which terminated in this result.—All the shares of the Wexford and Carlow Railway were subscribed for within a week after the issuing of the prospectus.—A Kerry paper complains that absentee landlords, receiving rent to the amount of 65,000*l.* per annum out of that district, do not contribute one shilling to the Agricultural Society of the county.—The local corps of pensioners, under the command of Major Swan, was reviewed on Saturday in the Phœnix Park by Major-General Wyndham. They mustered in number 600, and performed all their exercises with precision and alacrity.

Tipperary.—Another barbarous murder has been committed on the verge of this county. The victim was a person named Thomas M'Namara, who was employed as one of the bog-rangers on the Limerick estate of the governors of the schools founded by Erasmus Smith. He was murdered about noon on Saturday week, on the public road leading from Cappamore to Doon, on the lands of Ballycushown; there were people passing to and from the bog, bringing out turf to the very place where he was murdered. The police were soon on the spot, and arrested some persons whom they found there; one man, who was digging potatoes in a field next the road, fled, and the spade he was using could not be found. He was pursued by the police and others, and arrested at Doon.—On Monday week a man named Thomas Shanahan, a process-server, when returning from Borrisoleigh to Drumtrasna, where he lived, after serving law notices, was met by two men, who murdered him by breaking his head to pieces with stones. It was about 8 o'clock, and at that time two men who were employed in digging

potatoes in the neighbourhood, and natives of Clare, came up, when they were directed by the murderers to keep back, which they did for some distance, until they saw them leave the body and go through the fields. A number of processes were found in Shanahan's hat, which shows it was not through their means he was murdered, but he took an acre of land in the year 1841, from which another person had been ejected. The police, on hearing of the occurrence, proceeded to Shanahan's house, and searched several suspected places, but were not able to discover any clue to the murderers.—Another murder was perpetrated on Friday night at Lattera, in the Borrisoleigh district, not far from the place where Shanahan was waylaid. Six fellows entered the house of a person named Gleeson, on that night. One of the ruffians was armed with a pistol—the others with sticks or bludgeons. They beat Gleeson so dreadfully that he expired on Saturday evening. This murder is said to have originated in a private quarrel which Gleeson's step-son had with some persons in the neighbourhood! The nature of the quarrel is not stated, and none of the murderers are known, nor can they be described by any of Gleeson's family. An inquest was held on Sunday, when a verdict of "wilful murder against some persons unknown," was returned. Gleeson held a few acres of land on the estate of the Earl of Orkney, in whose employment he had been, as a labourer, for the last six or eight months, and was a person of very good character. A reward has been offered by the landlord and tenantry on the estate for such information as may lead to the discovery of the murderers.

SCOTLAND.

Edinburgh.—On Saturday last the topmost stone of the Scott monument was placed on that structure, which now exhibits its full proportions, and all the richness of its light and elegant Gothic tracery. The ceremony was performed by Mr. Donaldson, Grand Master of the Celtic Lodge, who had promised the late architect of the structure to perform this duty. Several other members of the Celtic Lodge were present, and the act of placing the stone was celebrated by three cheers from all who witnessed it. In the course of the afternoon, a number of the committee and other citizens ascended to the summit, being hoisted up through the main scaffolding by means of the steam-engine. Not a single accident has occurred during the progress of the work. The gigantic block of marble for the statue was unshipped on Monday at Leith, and is to be deposited in Mr. Steele's studio. The execution of the statue will occupy at least two years.

Kilmarnock.—A double suicide has been perpetrated in this town by a lady and gentleman unknown. They had been staying at the inn for some days, and were perfect strangers to the place, passing as man and wife. On Wednesday they paid their bill at the inn, and after dinner told the landlady, about 5 o'clock, they were going out to walk, and would probably be late in returning, as they wished to view some of the scenery of the neighbourhood by moonlight. They never returned—this intimation having been evidently a part of the singularly deliberate preparations they made for the act of self-destruction they had resolved to perpetrate. On the next day their bodies were found in the Irvine, fastened arm to arm by two pocket-handkerchiefs, which were so strongly and securely knotted, that both must have aided in tying them. Inside the gentleman's hat was a card of Mr. Atkinson, King-street, Cheapside, but this was evidently placed there to conceal their identity, as the parties are wholly unknown to that gentleman. Nothing has yet been discovered to remove the mystery in which the whole affair is involved.

SPORTING.

NEWMARKET HOUGHTON MEETING.—MONDAY.—The races began with a *Match*, 325*l.* to 300, 150 ft, Col. Peel's I-am-not-Aware, 8 st 4 lb. beat Lord Glasgow's Give-him-a-Name, 8 st 7 lb, by a length.—*Sweeps*, of 10 sovs each, for 3 yrs old, 7 st 7 lb; 4 yrs, 8 st 3 lb; 5 yrs and upwards, 8 st 5 lb. Winner to be sold for 350*l.* &c. 7 subs. Sir G. Heathcote's Khorassan, 4 yrs, and Mr. Mecklam's Philip, 4 yrs, beat Mr. H. T. Worley's Example, 3 yrs, and two others. A dead heat between the two first, beating Example by a head only.—*Handicap Sweeps*, of 25 sovs each, for three-yr-olds and upwards. 5 subs, two of whom paid 10 sovs each. Mr. Buckley's David, 5 yrs, 8 st 7 lb, beat Mr. Drinkald's Vol-au-Vent, 3 yrs, 6 st 5 lb, by a head.—*Match*, 200, h ft, Lord G. Bentinck's Clumsy, a feather, beat Sir J. Hawley's Vibration, 8 st 9 lb, by a length, easily.—*Match*, 100, h ft, Col. Peel's Garry Owen, 8 st 1 lb, beat Lord E. Russell's Nat, 7 st 5 lb, by two lengths.—*Cambridgeshire Stakes*, of 25 sovs each, 10 ft, and only 5 if declared, with 100 added by the town, &c. Last mile and a distance straight. 123 subs, 48 of whom declared. Lord Stradbroke's Evenus, 4 yrs, 7 st 10 lb, beat Mr. Irwin's Foig-a-Ballagh, 3 yrs, 8 st, and 17 others. Won very easily by two lengths; Walpole a bad third, Counsellor fourth, The Cure fifth, and Algernon sixth. The result was not more astounding to the backers of the favourite than it was to Lord Stradbroke, who, on the strength of a trial some days back, in which his horse was beaten, is said to have laid against him at long odds, and won very little, if anything, by the race. His nominal price in the ring at starting was 25 to 1; there is no doubt, however, that had any one been disposed to back him, 10 or 15 points more might have been obtained without the slightest difficulty. Foig-a-Ballah's defeat, decisive as it was, was anything but disgraceful; he gave the winner a year and 1 lb, and from the severity of the pace throughout, ran to a great disadvantage; notwithstanding this, he struggled gallantly to the end, and beat Walpole by four or five lengths, giving him 35 lb. From the extravagant odds laid some time back against the double and treble events, his party were enabled to hedge upon excellent terms, and are winners on the race.—*Criterion Stakes*, of 30 sovs each, 20 ft; for two-yr-old colts, 8 st 7 lb, and fillies, 8 st 5 lb. 40 subs. Lord Lonsdale's c by Jerry, beat Lord Glasgow's c by Bey Middleton, Lord G. Bentinck's Miss Elis, and eight others. Won cleverly by a length, Bastion a bad fourth, the rest beaten off.—*Deciding Heat for the 10 sovs Sweeps.* Philip beat Khorassan by half a length. *Match s.*—Lord Exeter's Merope, 8 st 8 lb, received from Lord Glasgow's Sister to Pathfinder, 6 st 8 lb, 200, h ft; Mr. Osbaldeston's Sorella, 10 st 7 lb, received from Duke of Bedford's Minotaur, 11 st 10 lb, 200, h ft; Duke of Beaufort's Captain Phebus received from Lord Eglinton's Britannia, 8 st 2 lb, 200, h ft.

TUESDAY.—*Match*, 50 h ft, Mr. Payne's Rigolette, 7 st 7 lb, beat Lord Chesterfield's Zahra, 7 st 8 lb, by a length. 7 to 4 on Rigolette.—*Handicap Plate* of 10*l.*, for three-yr-olds and upwards, Sir C. Monck's Glossy, 4 yrs, 6 st 1 lb, beat Colonel Anson's Marquise, 4 yrs, 5 st 9 lb; Lord Eglinton's Jamie Forest, aged, 7 st; Mr. Irwin's Mickey Free, 3 yrs, 7 st 7 lb, and Sir J. Hawley's Vibration, 5 yrs, 8 st; and 3 others. Won by half a length.—*Sweeps* of 10 sovs each; for three-yr-olds, 7 st 10 lb; four, 8 st 4 lb: five and upwards, 8 st 5 lb; winner to be sold for 80*l.* if demanded. 5 subs. Lord G. Bentinck's Prince of Wales, 3 yrs, beat Mr. Shelley's Five-times-Five, 4 yrs; Sir T. Munroe's Sangoree, 5 yrs; Mr. Dawson's Teresa, 3 yrs; and Mr. Balcmin's Dahlia, aged. Won by half a length, and winner claimed.—*Sweeps* of 10 sovs each; for two-yr-old colts, 8 st 7 lb; and fillies, 8 st 4 lb; winner to be sold for 260. 5 subs. Lord Chesterfield's f by Hornsea out of Game Lass, beat Mr. Hesseltine's Jessie Hammond, Lord Lonsdale's c by Emilius out of Rint, Mr. Stephenson's Matilda, and Mr. Edward's Hedgehog. Won by half a length.—*Match*, 100 h ft. Lord Chesterfield's f by Hornsea out of Industry, 7 st 10 lb, beat Duke of Bedford's Panther, 8 st. 8 lb, by half a length.—*Match*, 100, h ft. Lord George Bentinck's Naworth, 9 st, beat Lord Glasgow's c by Velocipede out of Amulet, 8 st, by a head.—*Hand cap Sweeps* of 15 sovs each, 5 ft, for three-yr-olds, &c. 6 subs. Lord Chesterfield's Cockfighter, 3 yrs, 6 st 11 lb, beat Lord George Bentinck's Great Mogul, 3 yrs, 7 st 6 lb, and Mr. E. R. Clark's Sir Edward, 5 yrs, 8 st 4 lb. Mr. Osbaldeston's Sorella, 3 yrs, 8 st 10 lb, and Captain Harcourt's Sir Abstruous, 4 yrs, 8 st 9 lb, came to the post, but did not get off.—*Matches*—100, h ft. Mr. J. Con., 8st 4 lb, beat Mr. Bristow's Carissima, 8st 4 lb; Mr. Newton's f. by Jerry, out of Pastille, 7st 2 lb; Lord Chesterfield's f. by Hornsea, out of Game Lass, 8st 7 lb, and Mr. Deakin's Caractacus, 7st 7 lb. Won by a length.—*Sweeps*, of 10 sovs each, for 2 yrs old colts, 8st 7 lb; fillies, 8st 4 lb. Winner to be sold for 150*l.* &c. 3 subs. Mr. Edward's Full Sail walked over.—*Sweeps*, of 50 sovs each, h ft, for 2 yrs old colts, 8 st 7 lb; and fillies, 8 st 4 lb. 8 subs. Old England made all the running, followed by Prologue, Plaudit lying off until within a quarter of a mile from home. The run in was very close, Old England winning by a neck, and Plaudit beating Prologue for second by a head.—*Matches.*—Lord G. Bentinck's All-round-my-hat, 8 st 3 lb, received from Lord Glasgow's Sister to Give-him-a-name, 7 st 5 lb, 200; Lord Stradbroke's Evenus, 8 st 5 lb, received from Sir J. Hawley's Bishop of Romford's cob, 8 st 5 lb, 200, h ft; Duke of Bedford's Oakley, 9 st 6 lb, beat Lord G. Bentinck's Naworth, 7 st 5 lb, by a length easily, 200; Mr. Osbaldeston's Sorella, 10 st 7 lb, beat Sir J. Hawley's Venus, 11 st 3 lb, in a canter by six lengths, 200, h ft. The match between Alice Hawthorn and Foig-a-ballagh will not be run; Mr. Irwin receives 150*l.* forfeit.

The Ratan Affair.—The report of the committee on this affair has been laid before a general meeting of the Club, and will be published officially next week. It is understood that Rogers and Braham will be warned off the Heath, and that the former will be prohibited from riding at Newmarket or any other place under the control of the stewards of the Jockey Club. The parties supposed to have been implicated by the evidence of Rogers and his confederate are, it is said, exonerated from all disloyal of the practice of gentlemen receiving and executing commissions for jockies and others intrusted with the charge of race-horses. It is not the intention of the Club to publish the evidence.

Running Rein and Crenoline.—The following was posted in the betting-rooms on Thursday morning:—"The Two-Year-Old Plate in October, 1843, has been awarded to Crenoline. All persons who backed her are entitled to receive, and those who betted against her are bound to pay.—STRADBROKE, EXETER, GEORGE BYNG."

Miscellaneous.

Dr. Wolff.—The *Morning Post* of yesterday states that they have just received, by express, a letter from their correspondent at Constantinople; we subjoin an extract:—"Constantinople, Oct. 17, 1844. I am happy to be enabled to state, on the best authority, that advices have been received of the arrival of Dr. Wolff at Meru, on his way to Teheran. Having thus crossed the frontier of Bokhara, his personal safety has been insured, and his return to the civilised world will be hailed with general satisfaction."

The Last of the Purkises.—It is recorded in the History of England, that the body of King William Rufus, after that monarch had met his death by an arrow discharged from the bow of Sir Walter Tyrrel, whilst engaged in hunting in the New Forest, was picked up by a man named Purkis, who placed the corpse of the king in a cart, and conveyed it to Winchester. It is a remarkable circumstance connected with the Purkises, that for upwards of 750 years they have continued to enjoy uninterrupted possession of the same identical spot, which amounts to about two acres of ground, situated near the village of Minstead, in the New Forest, contiguous to which the king was killed. From the earliest period of their history it is found that the Purkises were by trade or calling charcoal-burners, which same business they have continued to carry on from father to son up to the present time, and which mode of employment has fortunately afforded them the means of preserving their patrimony entire through a long course of generations. William Purkis, the present possessor of the above humble estate, is now in his eighty-seventh year, and, having outlived all his relations, is now the last of the Purkises.—*Morning Post.*

Hail-stones.—The *Memorial d'Aix* informs its readers that the storm which burst over that town on Sunday week was remarkable for the strange phenomenon which was witnessed in an adjacent commune. Hail-stones of an incredible size fell in the little district of Eguilles, one of which weighed as many as ten pounds! The rest were truly enormous. Luckily, the storm occurred in the night, so that nobody was exposed to the pelting of these terrible hail-stones.

BIRTHS.—On the 11th ult., at Malta, the lady of Captain H. HALLET, R.N., of a son—22d ult., at Canterbury, the lady of Capt. SMALES, King's Dragoon Guards, of a son—23d ult., at Frankfort-on-the-Maine, LADY DOWNIE, lady of SIR A. DOWNIE, M.D., of a son—24th ult., at the Lord Chief Baron's, LADY POLLOCK, of a son—24th ult., at 1, Belgrave square, LADY FANNY HOWARD, of a daughter—26th ult., at Castle Bernard, county of Cork, VISCOUNTESS BERNARD, of a daughter—26th ult., in Upper Harley-street, LADY LEE, of a daughter.

MARRIAGES.—On the 22d ult., at Ampthill, the Rev. F. C. G. PASSY, vicar of Wilstead, Beds, to HELEN L. DEARE, only daughter of the late P. Deare, Esq.—22d ult., at St. Saviour's Church, Bath, the Rev. G. WHITAKER, vicar of Oakington, near Cambridge, to ARUNDEL C. BURTON, only daughter of the late Rev. Richard Burton, and niece of J. G. Mansford, Esq., of Bath—23d ult., at Blair Vadock, Dumbartonshire, P. MAITLAND, Esq., of Freugh, Wigtonshire, to MATILDA F. H. BUCHANAN, youngest daughter of Mr. and Lady Janet Buchanan—24th ult., at St. Mary Magdalene, Peckham, J. BEATSON, eldest son of J. Beatson, Esq., of Peckham, to EMMA SPURLING, eldest daughter of J. H. Spurling, Esq., of the same place.

Chatfield, Esq., of Croydon—24th ult., in Regency-square, Brighton, Sir J. M. LLOYD, Bart., of Lancing, Sussex, aged 83—24th ult, E. H. WILLIAMS, Esq., of Eaton Mascott, Shropshire—24th ult., at Waltham Cross, H. DYSON, Esq., late of Park-lane, aged 82—24th ult., at Lucknam, Wilts, A. C. BOODE, Esq., aged 82—25th ult., at his residence, Brooklands, Great Oakley, J. BAILEY, Esq., M.D., aged 67—27th ult., the Hon. A. ANNESLEY, eldest son of Viscount Valentia—27th ult., at West Wycombe Vicarage, the Rev. W. R. JOHNSON, upwards of twelve years curate of the parish, aged 38.

WANTED, a FARM BAILIFF, upon a Farm of 300 acres, near London. He must be a perfect master of his business, active and economical in his arrangements, acquainted with the present improved system of Arable and Flock Farming, about 35 or 40 years of age, and with the best testimonials of his being a thorough Farmer.—Apply to Mr. LAWRENCE, No. 18, Piccadilly.

WANTED, a GARDENER.—He must understand Forcing and the Out-door department. Wages, 30*l.* per annum, with board, &c.; he must be a single man. Apply by letter addressed to A. B., Post-office, Leytonstone, stating length of service in last situation, &c.

WANTED, a FOREMAN in a LONDON NURSERY.—He must understand Propagation and the trade in its various departments. None need apply whose character and qualifications will not bear the strictest inquiry.—Application, with terms and reference, by letter only, to G. G., Messrs. Flanagans and Son, Seedsmen, Mansion House-street, London.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER OR GARDENER AND BAILIFF. A respectable middle-aged married Man (whose family cannot be considered an incumbrance) who has a general knowledge of his profession, and extensive experience in Early Forcing of every description, as well as a practical knowledge of the most improved system of Agriculture; is of sober, active, and industrious habits, which would render him a valuable acquisition to any gentleman requiring a person in whom he could place dependence. He has lived eight years in his present situation, has valuable testimonials as to his professional acquirements, and his character will bear the strictest investigation.—Direct to S. C., Mr. A. Russell, gardener, Turnham-green.

AS GARDENER.—An active, middle-aged married Man, without family, who has a good knowledge of Pines, Vines, and Greenhouse, and is perfectly qualified in all the other branches of Gardening; is a native of North Britain; distance no object.—Direct to S. S., Post-office, Wells-row, Islington.

AS GARDENER.—A Single Man, aged 34, who understands his business; Greenhouse, Hothouse, and Frames; Vines and Flower-garden. Can have six years' good character. No objection to a single-handed place.—Direct M. M., Mr. Kernan, Seedsman, 4, Great Russell-street, Covent Garden.

AS GARDENER.—A Married Man, with little incumbrance, aged 30; has a general knowledge of his business in all its branches; can take the management of Land and Cattle if required, or make himself otherwise useful; his Wife can take the management of a Dairy or Laundry. Can have a good character from the gentleman he has just left.—Direct A. B., at Mrs. Cobley's, Sydenham Hill, Kent.

AS GARDENER.—A Single Man, who perfectly understands his business in every department. Can have an unexceptionable character from the family he has just left. Direct to A. B., Inglebury Cottage, Brixton, Surrey.

AS SECOND GARDENER.—A Single Man, aged 25, who has had good practical experience in all branches of his profession; has lived in the above capacity, and can be well recommended; has no objection to any part of England.—Direct to W. S., Mr. Dionis, Nurseryman and Florist, King's-road, Chelsea, London.

S. GIRLING begs to refer the Readers of the *Gardeners' Chronicle* to his Advertisement of PETUNIAS, SEEDLING VERBENAS, DAHLIAS, &c., of the 12th October. **Danecroft Nursery, Stowmarket, Suffolk.**

LYNE'S NEW GERANIUMS.

WILLIAM E. RENDLE can execute a few more orders for the following:

Lyne's	Princess Alice	each—21*s*.
,,	Redworth	21*s*.
,,	White Perfection	21*s*.
,,	Confidence	21*s*.
,,	Imogene	21*s*.

Plants will be delivered after 12th November. "SAPPHO" cannot be sent out this season; no more orders can be received for "KING OF SAXONY."

LYNE'S "PRINCEPS," 10*s*. 6*d*. each.

*** The stock of the above is limited to about six plants of each; early orders are therefore necessary to insure a supply. **Union-road Nursery, Plymouth, Nov. 9, 1844.**

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may now be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London.

EXHIBITION OF CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, beg to state that their Collection of this beautiful autumnal Flower is now in bloom, and will continue for the next two or three weeks.

C. and Sons are now sending out healthy young plants of Double CAMELLIAS of sorts, with flower-buds, at 30*s*. per dozen; larger plants, 42*s*. per dozen; and young plants of the newer sorts, at 60*s*. per dozen. **Package included in the above prices.**

"GENERAL TOM THUMB" SCARLET PELARGONIUM.

PHILIP CONWAY, NURSERYMAN & FLORIST, &c., Old Brompton, through the kindness of Mr. Ayres is enabled to let out a few plants of the above, which is thus described in the *Gardeners' Chronicle*, page 560:—

"Unquestionably the finest Dwarf Pelargonium out is that which has this season been exhibited under the name of 'General Tom Thumb.' It grows almost prostrate, is exceedingly rich and dense in foliage, and produces with the greatest profusion large trusses of the most dazzling scarlet flowers imaginable. I have a plant at this moment nine inches high and six feet in circumference, studded with 27 trusses of expanded bloom, and some of the trusses six inches in diameter; and on five plants there are upwards of 120 trusses of flowers."

For both pot cultivation and bedding out this plant is unequalled. Plants 3*s*. 6*d*. each, or 36*s*. per dozen, with the usual discount to the trade if six are taken at one time. N.B.—At the June Exhibition of the Regent's-park Society a prize was awarded to the above; also to the following desirable variety of scarlets, viz.:—

Frost's Superb, a splendid pot plant	2*s*. 6*d*.
Mrs. Mayler, a very superior variety	2 6
Cooperi, dwarf, for bedding	1 6
Huntsman, do.	1 6
Shrubland	1 to 21*s*.
Compactum	1 6
King	1 6
Queen	1 6
Conway's Giant Cactus, strong plants.	3 6 to 10*s*. 6*d*.
Veronica speciosa	3 6
Pelargonium Lancii, for forcing	1 0 to 3*s*. 6*d*.

Cash, with an order, is respectfully requested from unknown correspondents.

RICH LEAF-MOULD and PEAT-EARTH.—Several acres of valuable Peat-earth and Leaf-mould of a rich quality, to be disposed of. Gentlemen and Nurserymen engaged in the Cultivation of Heaths and American Plants will find the above articles of a very superior kind. They will also be found of great value as dressings upon strong lands.—The Estate is within one mile of the Thames, convenient for water carriage. For full particulars apply to Mr. LAWRENCE, Corn Chandler and Seedsman, No. 18, Piccadilly.

THE NEW AND SUPERB SEEDLING PICOTEE, "BURROUGHES'S DUKE OF NEWCASTLE."

For particulars of the above, see YOUELL & Co.'s Advertisement of October 12th.

YOUELL AND CO. are also enabled to supply the following superb Picotees, raised by the same gentleman, all possessing first-rate properties, which have been exhibited and obtained first-class prizes at several of the metropolitan Exhibitions of the present year. They are as follow:—

Burroughes's	Mrs. Benyon, Red Picotee	7*s*. 6*d*.
,,	Lady Alice Peel, Rose Picotee	7 6
,,	Miss Jane, Purple Picotee	7 6
,,	Mrs. Bevan, Red Picotee	7 6
,,	Enchantress, Scarlet Picotee	5 0

CARNATIONS AND PICOTEES.

Y. and Co.'s collection of this beautiful tribe of flowers will be found the most extensive and select in Europe, comprising every known variety of merit. The plants are remarkably strong and healthy, and ready for sending out to any part of the United Kingdom and the Continent at the following prices:

				£	*s*.	*d*.

	Fine mixed Tritonias, p. doz. 2*s*. 6*d*.; mixed Ixias ,,	2 6

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

A SPLENDID NEW LATE PEACH.

MORTON'S "WALBERTON ADMIRABLE."—This splendid variety was raised at Walberton House, in Sussex, the seat of R. Prime, Esq. It is a Seedling from the Noblesse, which it much resembles, both in size and colour. It possesses all the fine qualities of its parent, but its great merit arises from its ripening full five weeks later. A specimen of its fruit was sent to Dr. LINDLEY in 1841, from whom were received the highest testimonials of approbation. The tree is a fine, free, and hardy grower; the fruit is full-sized, melting, and excellent-flavoured, rendering it a truly desirable variety, and one which no good garden ought to be without. Good one year's trained plants can be obtained of ALEXANDER WEBB, Nurseryman, Westergate, near Arundel, Sussex; at Messrs. HAY, ANDERSON, and SANGSTER'S, Newington Butts; and also at Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street, London, at 10*s*. 6*d*. each; a few strong plants at 15*s*. each. The usual allowance to the Trade when three or more are taken, and carriage paid to London. Remittance from unknown correspondents is required.

NORTHWARNBOROUGH & HARTLEYROW NURSERIES, ODIHAM, HANTS, UPWARDS OF FORTY ACRES, ESTABLISHED MORE THAN ONE HUNDRED AND FIFTY YEARS.

THIS BEING THE SEASON for Planting, J. and S. SHILLING beg to call the attention of the public generally to their Nurseries, which are well stocked with every description of Forest-trees, Coppice-plants, Flowering-shrubs, and Evergreens. And more especially do they invite attention to their Fruit-trees, which are very fine, healthy, well-rooted, and true to name. Every year, for walls and espaliers alone, they train more than Ten Thousand trees.

TO THE CULTIVATORS OF ROSES.

R. B. BIRCHAM, Hedenham Rosery, Bungay, Suffolk, begs to offer the following choice PERPETUAL ROSES. Good dwarf plants, own roots, suitable for pot culture or transplanting into the open borders.

Cloth of Gold (Noisette) strong plants, 7*s*. 6*d*.

Choice Roses selected from various classes:—Dwarf Standards, 12*s*. per dozen; do., superior kinds, 18*s*.; Standards, 18*s*. per dozen; do., most superior, 30*s*.

A descriptive Catalogue sent on application. Plants gratis, to compensate for distant carriage.—Hedenham, Nov. 8, 1844.

PLANTING SEASON.

W. ROGERS AND SON, NURSERYMEN, CONTRACT PLANTERS, & LANDSCAPE GARDENERS, Southampton, beg respectfully to notify that their Nursery Stock is this season unusually fine, and from the extent of their grounds they are enabled to execute orders to any amount, and at the lowest price; delivered free of carriage (if ordered in quantity) per railway to London, or by steam-vessels coastwise.

SEEDLING.

Ash, 1 yr., 1*s*. 6*d*., 2 yrs., 2*s*.6*d*.	Spanish Chesnut, 1 yr., 10*s*.
Beech, 1 yr., 2*s*.	Pineaster, 1 yr., 2*s*. 2*d*., 2 yrs., 3*s*. 6*d*.
Birch, 1 yr., 2*s*.	

Sea Pine (Pinus maritima), excellent for nurses or exposure to the sandy sea-shores of Scotland or Ireland, 1 yr., 5*s*., 2 yrs., 7*s*. 6*d*. per 1000.

Oak, the true "Durmast" of the New Forest (Quercus sessiliflora), producing timber of the largest dimensions, and decidedly the most valuable species of the English Oak, 1 yr., 7*s*. 6*d*., 2 yrs. 10*s*., 3 yrs. 15*s*. per 1000.

TRANSPLANTED.

Prices and samples of the various sizes may be had on application.

Alder			1	2 ft.		
Beech			1	2	4 ft.	
Birch			1	2	4 ft.	
Ash			1	2	3 ft.	
Spanish Chesnut			1	2	6 ft.

Scotch			1	2	4 ft.	
Pineaster				1	2 ft.	
Sea-Pine				1	2 ft.	

If 100,000 of any one sort is ordered, a deduction from these prices will be made.

PLANTS FOR COVER OR UNDERWOOD.

Rhododendron ponticum, 1 to 2 inches, transplanted, 20*s*. to 30*s*. per 1000. Not subject to the depredations of game.

Ditto, 2 to 4 inches, 40*s*. to 50*s*.; 4 to 6 inches, 60*s*. to 80*s*.; 1 foot, 25*s*. to 100. Not subject to the depredations of game.

Mahonia aquifolia, 40*s*. per 1000. Game are remarkably fond of the fruit of this plant, which is also a handsome flowering Evergreen.

Common Laurel, 20*s*. to 40*s*. per 1000.

Come-well Willow, 40*s*. per 1000. Best for Underwood.

Furze, 10*s*. per 1000. Broom, 10*s*. per 1000.

Alder, common black, 8*s*. per 100. Excellent for sea embankments. Tamarisk, 8*s*. per 100.

MISCELLANEOUS.

Single Camellias, from pots, well rooted, 50*s*. to 75*s*. per 100.

Rose stocks, 8*s*. per 100, from cuttings of the Bourbon De Lisle, on which all kinds take freely by buds and grafts, and may be grown in the smallest sized pots.

Double Furze, 25*s*. per 100. Forms a beautiful flowering hedge.

Double Red Thorn; Double White do.; Single new crimson, 50*s*. per 100. Sea Pine, from pots, 40*s*. per 100.

Rubes sanguineum, 12*s*. 6*d*. per 100.

Printed Catalogues of Prices of their general stock may be had. Gardeners of experience and ability recommended.

FASTOLFF RASPBERRY.

JOHN BELL begs to inform his Friends and the Public that he has grown the above Raspberry extensively the last three years and has now a fine stock of strong Canes, which he intends offering at the following prices, carriage paid to London and Hull, when 100 Canes are taken.

100 Canes	1*l*. 15*s*. 0*d*.	—package included.		
50 ,,	0 17 6	,,		
25 ,,	0 9 0	,,		

J. B. living in the neighbourhood where the above Raspberry has been cultivated for many years, can warrant it true. It may also be had of Mr. CATLEUGH, Nurseryman, Hans-place, Chelsea; and Mr. NUTTING, Seedsman, 46, Cheapside.

Nursery, Bracondale; Seed Warehouse, 3, Exchange street, Norwich.

WM. STIDOLPH, NURSERYMAN, near the Plough Inn, Bromley Common, Kent, begs to offer for Sale 4000 Spanish Chesnuts, 3 to 6 ft., 5000 Ash, 4 to 7 ft., 1000 Laurels, 4 to 6 ft., Scotch Firs and Weymouth Pines, 6 to 8 ft., Yews, 6 ft. and upwards, Rhododendron ponticum, 2 to 3 ft., flowering plants; Portugal Laurels, 3 to 5 ft., Purple Beech, 5 to 8 ft., Oaks, Elms, and Horse-Chesnuts, 10 to 16 ft., Privets, Laurustinus, &c. &c.

SHILLING'S EARLY GROTTO PEA.

THE above PEA possesses advantages over every other for autumn sowing, being quite hardy, very prolific, and much larger than any other early Pea. See *Gardeners' Chronicle*, 25th of last May. "Mr. Shilling has sent us specimens of his New Early Grotto Pea, which were gathered on the 20th inst. He states that these were grown from seed sown in the open ground on the 25th of last November. Judging from the specimens sent, this is a fine, large, round-looking Pea, and will, no doubt, be found to be a very useful early variety."

To the Market Gardener they will be found invaluable. Price 1s. 6d. per quart, free per rail.

SHILLING'S QUEEN CABBAGE, which gave such general satisfaction last year, as the best early variety grown. Having saved a considerable quantity of seed this summer, it is offered on the following advantageous terms:—1s. 6d. per oz., 10s. 6d. per lb.

Agents—Messrs. Field and Co., 113, Lower Thames-street, London; Messrs. J. and W. Noble, 152, Fleet street; Mr. J. Kerman, 3, Great Russell street, Covent Garden; Messrs. Hurst and M'Mullen, 6, Leadenhall street.

Northwarnbro' Nursery, Odiham, Hants.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX; and at PARIS.

WILLIAM WOOD AND SON beg leave to offer their extensive Stock of CAMELLIAS, fine Stocky Plants, well furnished with Flower buds, at the following prices, the selection of Sorts being left to themselves.

Good and Esteemed Varieties	. . .	30s. per dozen.
Superior Selected do.	. . .	45s. ,,
Superb New do.	. . .	60s. ,,

Also a Superb Collection of all the best and newest CINERARIAS, fine Bushy Plants, well adapted for flowering during the winter months.

Very fine Varieties	. . .	6s. per dozen.
Superior Selected do.	. . .	12s. ,,
Superb New do.	. . .	18s. ,,

Plants will be presented to compensate for carriage. Catalogues of the above; also Lists of W. W. and Son's Collection of FUCHSIAS, VERBENAS, Greenhouse and Herbaceous Plants, may be had *gratis* on application.

Woodlands Nursery, Nov. 9.

TO THE PLANTERS OF ENGLAND.—TRUE HIGHLAND PINE.

JAMES GRIGOR, NURSERYMAN, Norwich, begs to remind such of the Planters of England as are anxious to enhance the beauty and value of their estates, that he is now sending out plants of this recently introduced and very desirable timber tree, at the undermentioned prices:—

Single plants, strong and well rooted . .	6d. each.
Strong plants, 20 inches high . . .	5s. per 100.
Do. 18 ,, . . .	80s. per 1000.
Small transplanted plants . . from 10s. to 20s.	,,

For introducing this tree Messrs. GRIGOR, of Elgin and Forres, were awarded several premiums by the Highland and Agricultural Society of Scotland, where it is rapidly superseding the common Pine. In its old age it assumes in a great measure the dark-green grandeur of the Cedar of Lebanon, and is therefore invaluable for planting in masses throughout the more prominent parts of distant landscapes. Sir Walter Scott describes it as presenting much of "the bold and contorted figure of the Oak;" and the *Quarterly Review* recommends it as an acquisition to churchyards and cemeteries. It is highly esteemed for all economical purposes, on account of the hardness and durability of its wood.

N.B.—J. G. has for the present disposed of all his potted plants; but as the others have excellent roots, there is no risk in removing them. A supply in pots will be ready in the course of next month.

CEDRUS DEODARA, raised from seeds in the open ground, 10s. each. Araucaria imbricata, Pinus excelsa, &c. &c. on reasonable terms.

TO PEAR-GROWERS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, CLARENDON NURSERY, ST. HELIER, JERSEY,

Begs leave to draw the attention of Pear-growers to his new PEAR, named "LANGELIER'S BEURRÉ" of first rate merit; perfectly melting ripe in January; shape of Napoleon, but larger in size: standard, tree very vigorous; one of the best flavoured Pears known, otherwise it would not be recommended by R. L., as his motive for advertising it is not for the sake of publishing, but for the good of the public in general, to whom he is happy to have the opportunity of rendering himself useful; of which "VON MON LEON LE CLERC" will be a sufficient guarantee, having proved itself as it was represented, and given universal satisfaction. The trees of this Superb New Beurré are small and limited in number, and the price will be 21s.; if 6 trees are ordered, 7 will be sent; no discount will be allowed to the trade, and to the trade only will 8 plants be sent for 6; the number is very limited. R. L. also takes this opportunity to state that to this day numbers of "Von Mon Leon Le Clerc" remain unpaid for, consequently none will be sent to unknown correspondents, except for ready cash, or post office order.

As this is the season for planting, R. L. wishes to draw the attention of the public to his acknowledged and unrivalled Collection, of which a List may be had by pre-paid letter, and begs to state that nothing is sent from his Establishment except proved fruit, unless requested. R. L. also wishes to obtain attention to a small quantity of EVERGREEN OAKS, among which will be found a great variety; they are fine and healthy, 2 years old, about 18 inches to 2½ feet high, fit for planting or potting, price 20s. per 100. Also, fine KIDNEY POTATOES, superior in flavour and produce to the Ash-leaf; the sample, extra fine, 5s. 6d. for 34lbs. weight, as not less than that quantity will be sent.

HARDY SHRUBS AND HERBACEOUS PLANTS, &c.

WILLIAM MAY, F.H.S., cultivating the above in large quantities, is enabled to offer them on the very moderate terms below named, to which he respectfully begs to call the attention of persons about to make new or add to old Plantations. He can recommend them as being showy, fine varieties, collected for display, and not for mere botanical curiosity. The plants are strong and healthy, and will be correctly named, viz. Hardy Shrubs, two each, 42s. per 100; if 500 taken at once, 100 or more sorts will be sent; the 500 for 10l. Hardy Herbaceous Plants, 100 sorts for 42s., or 200 sorts for 80s.; the selection being left to W. M. Victoria late Red Currant, 10s. a dozen; Hollyhocks, fine double sorts, at 42s. per 100. (See Advertisement, *Gardeners' Chronicle*, Oct. 5.) Remittance or reference from unknown correspondents.

Hope Nursery, Bedale, Yorkshire, Nov. 9.

CLEOPATRA is the largest, most constant, and best YELLOW DAHLIA in the World; it has been Exhibited at various Shows 17 times, and always successful—the same that was seen at Mr. Nutting's, of Cheapside, for nearly three months. It will be impossible to supply successfully without Cleopatra; no yellow can come near her for constancy, brilliancy of colour, and grandeur of habit; and it is offered to the Trade in shares of two good grown tubers for 10 guineas; if all the shares are taken by the 15th of Nov. Plants in May, 10s. 6d., and no one cheaper unless to those who pay at once names down for roots, and be disappointed. The Uxbridge Nursery is famous for its splendid growth of Fruit-trees and Evergreens, Anemones, Pinks, Picotees, Carnations, Pansies, and Florists' Flowers in general.—BROWN and ATTWELL, Uxbridge Nursery, Nov. 7.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY.

NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, HIS GRACE THE DUKE OF MARLBOROUGH, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD RONDES, &c. &c., as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL & CO. have much pleasure in announcing they are enabled to supply fine Canes of the above highly valuable and much esteemed Raspberry, unequalled for the extraordinary size of its fruit, and richness of flavour.

Those to whom Y. and Co. sent last season have expressed their high admiration of its superiority over all other varieties, and have been awarded several prizes at various Horticultural Exhibitions during the season. As a proof of they have not exaggerated its excellent qualities, Fruit was submitted to Dr. LINDLEY (see *Gardeners' Chronicle* of the 22d July, 1843, p. 502) whose opinion of it is as follows:—

"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find it merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly, and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded; and again at the Horticultural Society's Exhibition at Chiswick, July 13, 1844; on both occasions it maintained its high character, by having a Certificate of Merit awarded it. It would therefore be unnecessary for YOUELL and Co. to recommend it more fully, or with greater confidence to the notice of the public, merely observing that it continues in high perfection throughout the autumnal months (vide *Gardeners' Chronicle*, 19th inst., page 703), and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom upon the following terms:—

Packages containing 100 Canes	.	£2	0 0
Ditto ,, 50 ,,	.	1	1 0
Ditto ,, 25 ,,	.	0	12 0

Package included.

YOUELL and Co. feel it due to themselves to state that a spurious kind was offered for sale by other parties last season, under the title of "Fastolff Raspberry," the same having no pretensions to the genuine variety; and to obviate a repetition of the like they have appointed the following Nurserymen and Seedsmen as their Agents for the sale of it, at whose establishments may be seen engravings of the Fruit:—Bury St. Edmunds—Mr. R. Pettit; Canterbury—Mr. W. Masters; Carlisle—Messrs. Little and Ballantyne; Chichester—Messrs. Newman and Co.; Cliff Vale, near Leek, Staffordshire—Mr. F. Fox; Cork—Messrs. Haycroft; Doncaster—Mrs. Milan, Seed-shop; Dundee—Messrs. Urquhart and Son; Durham—Messrs. Hancock and Sons; Edinburgh—Messrs. Peter Lawson and Son; Fulham—Messrs. Whitley and Orsborn; Glasgow—Messrs. Drysdale and Co.; Haddington—Mr. T. Dods; Halifax—Mr. W. Throp; Jersey—Mr. B. Saunders; Leeds—Messrs. Ely and Son, Rothwell Haigh; London—Messrs. Flanagan and Son, No. 9, Mansion House-street, and Messrs. Noble, No. 152, Fleet street; Liverpool—Mr. James Cuthbert, 12, Clayton-square; Manchester—Mr. H. D. Cormack; Nottingham—Mr. J. F. Wood, The Coppice; Peterborough—Mr. John White; Penzance—Mr. J. Fox; Plymouth—Mr. W. E. Rendle; Sheffield—Messrs. Fisher, Holmes, and Co.; Southampton—Mr. James Ingram; Stafford—Mr. J. Sandy; Torquay—Mr. J. Morgan; Wakefield, Mr. W. Barratt; Waterford—Messrs. Fennessey and Son; Westerham, Kent—Mr. I. Cattell; Wexford—Mr. James Harpur; York—Messrs. T. and I. Backhouse.

YOUELL'S CELEBRATED TOBOLSK RHUBARB, the earliest sort known; fine roots, fit for forcing, 12s. per dozen. For Particulars, see their Advertisement of the 2d inst.—Great Yarmouth Nursery, Nov. 7, 1844.

DOUBLE ROMAN and PAPER-WHITE NARCISSUS, 4s. per dozen. The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. COBBETT'S, late MR. BARRON'S, Italian and Foreign Warehouse, 18, Pall Mall. Also Dutch Hyacinths, Crocuses, Tulips, Anemones, &c. &c.; Price Catalogues of which may be had per Post.

TO THE LOVERS OF ROSES.

WOODLANDS NURSERY, MARESFIELD NEAR UCKFIELD, SUSSEX; AND AT PARIS.

WILLIAM WOOD AND SON have the honour of submitting to the notice of their Friends and Amateurs, the undernamed truly magnificent Gallica ROSE; it has flowered here this season in great perfection, and Blooms were forwarded to Dr. LINDLEY, whose opinion appeared in the *Gardeners' Chronicle*, page 461.

MARGARET MARY (Wood's).—"Your seedling, Gallica, is a handsome variety, fine in form, being compact and very double, outside petals finely cupped; in colour it is of a purple rose, of a peculiar and beautiful tinge; it is fragrant, and at its best when fully expanded."

Plants of the above are now ready for immediate delivery. Standard and Dwarf at 5s. each. The usual discount to the trade when not less than six plants are ordered at once.

W. W. and Son further beg leave to state that they have on hand a very extensive stock of Roses, at the following prices, when the selection is left entirely to them:—

	Per doz.	Per 100. £ s. d
Superior selected standard Roses . .	24s.	
Superb do. do. . .	30 or	10 0 0
Select dwarf budded do. . .	12 —	3 15 0
Superb do. do. . .	18 —	5 0 0
Superior dwarf Roses (on own roots) . .	9 —	2 10 0
Superb do. do. fine show varieties	12 —	3 15 0
Fine Climbing do.	9s and 12 —	2 10 0

Catalogues of Roses and Nursery Stock will be sent gratis on application.

N.B. Plants will be presented GRATIS, in order to compensate the expense of carriage. A remittance, or reference, will be required from unknown correspondents.

TO NURSERYMEN, &c.

NURSERYMEN and OTHERS desirous of supplying PLANTS for the BIRKENHEAD PARK, which is now ready for planting, are requested to send their names and address to Mr. KEMP, Park-office, Birkenhead, on or before THURSDAY, the 14th November, when they will have Circulars and Lists forwarded to them, if their locality be deemed suitable.

By Order, SAMUEL MOSS.

N.B.—Plants from a cold sea-coast, or from northerly districts, will alone be eligible.

Town hall, Birkenhead, Oct. 31, 1844.

MAGNIFICENT NEW PRIZE PLANTS.

JAMES CUTHILL begs most respectfully to announce that he has unusually fine Healthy Plants of the [illegible] LISIANTHUS RUSSELLIANUS, which can be selected from upwards of 1000, from 2s. 6d. to 5s. each. J. C. has been awarded 12 Prizes for this Lovely Flower. Also Lisianthus nigrescens, 5s. to 10s. each: it was shown at Regent street, on [illegible] last, with upwards of 20 new Dahlias (a Specimen Bloom of each variety was provided). L. Longiflorus, 2s. 6d. to 5s. Cuphea ignea, 2s. 6d. to 5s. each. The above are all imported plants. A Prize will accompany each order on the best Method of growing the above Plants. Lisianthus Russellianus Seed, 2s. 6d. per packet. Also Seed of the Calceolaria, from Lady Cunliffe's, Sheffield, and other First rate Flowers, artificially set, 2s. 6d. per packet. Cuthill's Early Melon, the earliest ever grown, took the First Russian Medal at Chiswick, in May last, is generally approved of, very much approved of for an early crop. Fleming's Trentham Hero and Cabul Melon, a delicious Melon. Also a very fine Cucumber from the Emperor's Garden, Constantinople, presented to me by F. Passingham, Esq., Truro. The above Melons, 2s. 6d. per packet of 10 Seeds. Latter's Victory of England Cucumber, 2s. 6d. per packet. Cuthill's celebrated Early Black Spine Cucumber (the highest testimonials have been sent about this handsome sort), 2s. 6d. per packet. If 3 packets of the above seed are taken, 6s. A very fine Long German Vegetable Marrow, 6d. per packet. Cuthill's Solid White Celery, 6d. per packet. Fine Roots of Cuthill's Prince of Denmark Clove scented Carnation, a first-rate Scarlet, a first-rate Border Flower, and an excellent Forcer, 12s. per dozen. Also good Picotees and Carnations, 12s. per dozen. British Queen and Keen's Seedling Strawberries in Pots for Forcing, can be selected out of thousands of very fine Plants.

A Post-office order on the Camberwell Post-office, directed to JAMES CUTHILL, Florist, Denmark-hill, Camberwell, London, will meet with careful attention.

PIPER'S SEED WHEAT AGAIN!

J. D. PIPER has not sold all his Seed Wheat. As the season is far advanced, and he is unwilling it should lie ground, he offers it at a wholesale price, in quantity not less than 10 sacks, at the following prices:—

PIPER'S THICKSET . .	20l. per Load.
COLNE WHITECHAFF . .	15l. ,,

And if Earl Ducie, or any other person or persons possessing a Model Farm for the public good, and the benefit of Agriculture, will apply (should not wish to receive more than half a score applications), J. D. P. will give one bushel of either sort, and send it 50 miles carriage free.—Colne Engaine, Essex.

LARGE STOCK OF SEEDLINGS.

W. & T. SAMSON, Kilmarnock, Ayrshire, have a large stock of the following plants, which they will dispose of at low prices:—

American arbor-vitæ, 2 years old . .	50,000	Larch, 1 year old .	1,000,000
Ash, 1 year old .	200,000	Quercus macrocarpa, 1 year old . .	15,000
Beech, 1 year old .	1,500,000	,, palustre, yr. old	25,000
Bullace, wild, 1 yr. old	5000	,, rubra, 1 yr. old	5000
Elm, 1 year old .	200,000	,, tinctoria, 1 yr. old	5000
Holly, 1 year old .	150,000	Scots Fir, 2 years old	1,000,000
Hornbeam, 1 year old	150,000	Sloe, or Blackthorn, 1 year old . .	150,000
Juniper, common, 1 year old . .	50,000	Spruce, 2 years old	1,000,000
Quercus coccinea, 1 year old . .	100,000	Thorn quicks, 1 year old . . .	1,500,000

They have also a large quantity of transplanted Azalea pontica, American arbor-vitæ Evergreen Privet, Irish Yew, 1½ foot, Double Redthorn, fine plants, &c. &c., which they are inclined to sell cheap.

Sales by Auction.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to Public competition, at the Auction Mart, Bartholomew-lane, on Friday, Nov. 15, 1844, at 12 o'clock, a very fine Collection of Standard and Dwarf ROSES; a Bed of choice-named TULIPS, comprising most of the leading varieties; also a splendid Assortment of DUTCH BULBS, comprising fine Double and Single Hyacinths, Narcissus, Jonquilles, Anemones, Crocus, Dens Canis, &c. May be viewed the Morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

ST. ALBAN'S, HERTS.

UNRESERVED SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the Mortgagee (in consequence of the Estate having been disposed of), to submit to public competition, on the premises, the Key Field Nursery, St. Alban's, on Monday, Nov. 18th, 1844, and following days, at 11 o'clock, the whole of the varied NURSERY STOCK, comprising Fruit and Forest-trees, Evergreens, Ornamental, Deciduous, and American Plants of every variety, and about 3000 Standard and Dwarf Roses, consisting of the choicest varieties; 1,000,000 Quick and Oaks, of different ages; Seedling Beech, Ash, &c., Sea Kale, Asparagus, and Rhubarb, Dahlias, and Herbaceous Plants. The lots will be arranged to suit large and small purchasers. May be viewed one week prior to the Sale. Catalogues 6d. each, returnable to purchasers, may be had on the premises, of A. A. DORANT, Auctioneer and Land Surveyor, St. Alban's; of the principal Seedsmen in London, and of the Auctioneers, Leytonstone, Essex.

BROMPTON-PARK NURSERY AND SEED ESTABLISHMENT.—ESTABLISHED 1851.

MESSRS. GRAY, ADAMS, AND HOGG have much pleasure in directing the attention of their numerous customers to their extensive NURSERY STOCK, consisting of Dwarf and Standard Maiden and Trained Fruit trees, Figs, Vines, &c. &c., all of which are this season of a very superior description, and will fully maintain the reputation this establishment has for such a long period of years enjoyed for producing these articles. The peculiar nature of the soil renders the removal of all ornamental trees and shrubs almost certain, of which there is a select and extensive collection; together with everything that is desirable in the class of Greenhouse and Herbaceous Plants.

MARKET GARDENERS are invited to inspect a fine stock of Half Standard Apples, Pears, and Plums, which they will find well worthy their attention.

The SEEDS of this season that have come to hand are generally of a very fine quality, and of which Catalogues will be issued in due course.—Kensington-road, Nov., 1844.

ELIGIBLE ESTABLISHMENT IN BUSINESS, IN KELSO, ROXBURGHSHIRE.

MR. LOCKIE, SEEDSMAN, finding it expedient, from his other occupations, to relinquish the Wholesale and Retail Seed Trade, &c., conducted by his late father and himself for upwards of 57 years, is ready to dispose of the BUSINESS and STOCK in TRADE; as also to let the Shop and House in the Market-place, and Granary in the Horse Market, to any party wishing to obtain so eligible an opening.

Mr. Lockie will continue the business as usual until an arrangement is made; but the party intending to succeed to it may have immediate entry to the whole premises.—Apply to Mr. GEORGE MAIN, Writer, Kelso.—Nov. 9.

THE TRUE FASTOLFF RASPBERRY.

YOUELL AND CO. take the present opportunity to state that the above unequalled Raspberry is to be obtained only at their Nursery or of their Agents, a list of whom appear on the Advertising Sheet of this day's *Gardeners' Chronicle*; and they recommend their friends to be cautious of whom they purchase, as another Raspberry, under the above title is being substituted by certain parties as the "true variety."

Great Yarmouth Nursery, Nov. 7, 1844.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 9, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Nov. 13 Microscopical . . . . 8 P.M.

SATURDAY, Nov. 23 Royal Botanic . . . . 4 P.M.

WE have been surprised of late to perceive that an influential part of the daily press has thought fit to urge objections against the systematic continuance of AGRICULTURAL AND HORTICULTURAL SOCIETIES, on the plea that they do not effect any substantial advantages among the practical classes of farmers and gardeners; that competitions between mere *amateurs* produce no beneficial results to those who live by husbandry, or cultivate market-gardens. If an enormous prize ox be fattened by the nobleman's bailiff, it is said that the cost of bringing him to the high condition in which he is exhibited to public admiration is more than the value of the meat in the market; that wealthy proprietors only can afford to amuse themselves thus, because they have means and facilities beyond the reach of those humbler individuals for whose benefit the Societies to which we are referring are professedly embodied. Nothing can show a more entire ignorance of the true bearing of such associations than such crotchets as these.

Every intelligent farmer and gardener knows that the range of experimental investigation in his department is almost boundless; and he finds that each revolving year adds to his practical, if not to his theoretical knowledge. He knows, too, that the prize ox has not been brought to his high condition without great attention to the most improved routine of husbandry in all its bearings. The culture of green crops in a corresponding degree of excellence with that of large cattle reared and fattened for the shambles is to be assumed; and in order to have abundant and superior green crops, white crops must be proportionably raised. Manure cannot be abundantly accumulated without cattle, nor cattle littered without Straw: one branch of farming thus necessarily involves the necessity of another, and within a very extended and comprehensive range of perfect or very superior husbandry, as pursued on the demesne of the wealthy proprietor, or the great farm of a rich and intelligent tenant, who follows the profession by which he lives with energy and enthusiasm, a vast variety of improved details is involved, among which the common farmers and peasantry may assuredly find something worthy and easy of adoption. It is also of great importance to have experiments conducted by those who can afford to make them without regard of the loss in case of failure; and unquestionably the desire of obtaining distinction for skill and perseverance in the promotion of useful knowledge stimulates to competition, while the honorary prize, which is the testimonial of merit, costs the Society which awards it little or nothing.

The presentation of a single medal has often led to movements in husbandry which have afterwards advanced to points of great importance. If recent instances be of any value in illustration of this remark, we would adduce the great extent—great in comparison with previous efforts—of thorough-draining executed last year, in Ireland, by four spirited proprietors, who, however patriotic and enterprising they may be systematically, as improvers of land, would not, in all probability, have completed so great an extent of draining without the agency of the Royal Agricultural Society of Ireland, which stimulated their energies by proposing a prize to the successful competitor in that important branch of improvement to which attention has been so much turned of late years, and in the advancement of which Mr. Smith has acted so conspicuous a part.

It surprises us to hear any persons attempting to throw discredit upon Societies which are formed on sound principles, and for utilitarian objects; and illiberally sneering at operations which are not always perfectly understood, either in object or detail, by those who think fit to denounce them.

It is a very desirable matter that the aristocracy of any locality should take a deep and practical interest in agricultural and horticultural occupations. The sports of the field, though possibly necessary for the health and recreation of idle country gentlemen, and certainly great inducements to their residence on their rural estates, are often interrupted by unpropitious weather; and the extravagant amusements of the *turf*, or of the silly and cruel steeple-chase, are at best but brief periodical excitements, which are often seriously depressing in their consequences to the over-worked mind, and exhausting to the purse, while they tend to render the human heart as callous as the whip or spurs in which the jockey glories. The individual whose horse is to run for the high stakes of a celebrated race, has nervous sensations unfelt by him whose cattle quietly contend in the ploughing-match; and surely, in point of utility, there is no room for disputation as to the comparative advantages of the different pursuits.

Then as to gardening—Where can there be found more innocent or interesting employment of the active kind, or which tends more, when scientifically conducted, to elevate and expand the mind? What relaxation for the saddened or fatigued spirit can be named, that is more calculated to soothe and relieve it than occupation in the greenhouse or the open garden? And if idleness oppress—if the miserable sensation of a want of something to do renders the fine lady or fine gentleman listless, where can a more pleasing excitement to thought and gentle exercise be found, than in the garden and shrubbery? Nor is this pleasure occasional and evanescent—it may be enjoyed at all times; and the most delicate female can never be without inducement to inhale the free air of heaven—so essential to the preservation of her health and beauty—while she has her flower garden and conservatory to visit and arrange. In short, the possession and management of a well-ordered farm and garden is a point of attraction to our gentry; and if they can support the expense of maintaining first-rate bailiffs and gardeners, who can win prizes in their respective departments, they not only encourage a class of men whose occupations are pre-eminently useful and pleasing, but they become the means of imparting to the inferior grades of rural occupiers, that desire for acquiring good skill and taste in the management of their humble allotments, which so decidedly tends to advance their condition. Although there may be occasional ground for dissatisfaction at the supposed ignorance or partiality of Judges in the distribution of prizes (we are now alluding more particularly to the Horticultural Shows), and that feeling of jealous rivalry which mean minds so frequently entertain, with or without reason, still the principle of competition is useful. People of sense not only bear disappointments with a good grace, but feel a generous pleasure in seeing displays of finer plants than they themselves possess, and instead of grumbling at everything which has not been exactly in accordance with their own views and caprices, determine to persevere steadily in their efforts, being quite content to witness the progress of the art which they admire, without experiencing any mortification at their own failures, and very happy to see rich and poor assembled together for the enjoyment of a pure and rational pleasure. Then, when an ardent florist exposes to the scrutinising examination of experienced judges some splendid flower which he has raised himself, how happy is he! How he contemplates his admired specimen! with what satisfaction he criticises its form and colours! He pets it as if it were his child; guards it "lest the winds of heaven should visit it too roughly;" gives it air, and warmth, and nourishment suited to its condition and necessities; watches over its growth, with the certainty of receiving no ungrateful return for his care. All this is at least harmless enjoyment, gentle and soothing, and such as never costs a tear of mortification or regret.

And who that has a heart will not experience more genuine delight in looking at a fine collection of choice flowers than in viewing an extravagant display of expensive dishes and of labelled decanters upon his table, for the entertainment of people who do not care one farthing for their entertainer?

And who that sees the beautiful specimens of new varieties which the tasteful gardener perpetually raises—as much from the influence of professional emulation as from the love of his art—will say that the Horticultural Show is useless, or that the art of gardening can go no farther? Let us just first reflect on the advancement which has been effected in the culture of the Pelargonium, for no plant has been more varied within 20 years; persevering cultivation has wrought the most surprising changes, and produced a most wonderful number of varieties in this beautiful flower. The corolla has been enlarged, the colours, infinitely diversified, have passed through successive gradations from the purest white to the deepest shade of black. That beautiful plant which, during half the year, ornaments the drawing-room or the conservatory, owes its pre-eminence to honourable emulation. Again, in the tribe of Roses—of which more than 2000 varieties exist—there were but five kinds known 160 years ago in France and England; and when a sixth was imported into the former country from Italy, for the first time, all the world of florists went mad to obtain it. When Linnæus published his "Species Plantarum," in 1762, there were only 14 kinds of Roses known, and now there are more than 2000. What but the spirit of competition has effected this enormous increase? What but emulation produces, every season, some new sorts by budding and grafting, which bring forth the innumerable hybrids of the Rose tribe? And though some old-fashioned florists may complain that caprice and fickleness, which operate more or less in all human affairs, have caused results not altogether legitimate in the royal family of Roses, both red and white, by substituting the younger scions for the elder branches, bringing into popular favour the hybrids of yesterday, we cannot but think it is no small advantage to have obtained plants that, unlike the old parent stock—which, no doubt, was very respectable in its day—will exhibit animation throughout the year, though their flowers be deficient in the odour and excellence of the ancient family.

We know that some humbug is occasionally the result of a successful hit at a Prize Show of Flowers, but it is not of any serious consequence, nor can it in these days, when there are so many professional rivals in the floral department, affect the pocket of the amateur, to any sensible degree, as might have been the case in the days of the Tulip mania, when Hollanders made fortunes by a few of the idol plants of their country. For example, a specimen of the Pansy is honoured with a prize at Chiswick, or some other great National Exhibition, and the happy owner advertises his spare plants of the favourite kind at a very high price compared with their real value, but low in itself, and a mere trifle for a *fancy* article, and such as no amateur will consider a drain from his purse, while the payment of it tends to encourage the gardener who lives by his occupation. In fine, whether the vegetable productions encouraged at our Horticultural Shows be Pines or Potatoes, Cauliflowers or Carnations, Parsnips or Pansies, we wish success to those who deserve it in their respective classes, whether the claimants be Peers or Peasants, or of the more really interested grades—those in middle life.—*Martin Doyle.*

REMARKS ON FORCING PEACHES.

[See page 243].

IN answer to "A Subscriber," regarding the temperature, &c. at which I force my Peaches, I may mention that, as I am obliged to force them in the Pine-stove, having no intermediate house for that purpose, I am, therefore, under the necessity of keeping a higher temperature at the commencement than I otherwise would do if I had a Peach-house to begin with.

The house in which I force my Peaches in pots is a large one, constructed of iron. I grow Grapes up the rafters, and Pines in the pit. The house is heated by common flues, with two 4-inch hot-water pipes going round one end, and along the side of the front flue. The fire, after passing round the boiler, enters the bottom of the back flue, which is a double one, and returns by the top flue, escaping in a chimney over the boiler. On the top of the back flue I place as many trees as I can conveniently, and on the back curb and end curbs of the Pine-pit I put the remainder. By this means it will be seen that the Peaches are not in the way of the Pines, as you can walk along the back passage between them. The Vines are confined to the rafters, and no useless wood is allowed to remain on them that would tend to shade the Peaches.

When I commence forcing, I endeavour, if possible, to bring the trees into the house in mild weather, there being much less difference then between the temperature of the internal and external air; I generally put them in during November, a little earlier or later according to the state of the weather; I do not start them all, however, at once; the last lot are not put in until the 1st of January. Any later than this would not answer, as the weather, if clear, is then hot through the day. I commence forcing them at 55° at night, allowing the thermometer to fall to 50° in the morning, if cold, but, if the weather is mild, it is never allowed to fall below 55°, and from that to 60° is the usual temperature kept up throughout the period of forcing during the night. It is during the day that I make up for low night temperature, that is, when I have the chance by sun heat. On the second day after I had brought my trees in-doors last year, the temperature of the house was 80° for two

hours during the middle of the day. Now, those who are accustomed to plod on from November to the latter end of June will think this a strange way of forcing Peaches: but the fact is, if I can get sun heat, I am not at all fastidious about a few degrees; to get it high enough is the main point—say from 70° to 85° and 90°, until the fruit is stoned; I then keep them very hot during the day—viz., from 95° to 105°, and sometimes even as high as 110°. Of course a great deal of moisture is required with this high temperature; a moist atmosphere is congenial to both Pines and Peaches. I syringe over head twice a day, and sometimes oftener, when the air is dry; and the consequence of this treatment is, I am scarcely ever troubled with either green-fly or red-spider.

Watering at the root must be carefully attended to; very little is wanted until the trees get covered with leaves; but after the fruit is stoned, they should be watered plentifully, if you wish to have good fruit. Of course the watering must be gradually withdrawn as the fruit approaches maturity, in order to increase their flavour.

The following objection has been offered against early forcing of Peaches, viz. that they can have no flavour at that early season; but the fact is, to grow the trees in pots is the only way to have the fruit well flavoured, as the roots are then completely under control. Some say that I will soon lose all my Pines by the high temperature at which I keep the Peaches; but these persons do not consider that I am taking the very best plan to make my Pines grow, by treating my Peaches in the manner above stated; and I invite any one to come and see my Pines and Peaches growing together, when they can form their own opinion of the matter.

Now, with regard to the trees, unless they are prepared for forcing, you have no right to expect fruit in April; but if you think otherwise, try. Maiden plants are the only ones to begin with. Pot in as small pots at first as you can, and cut down to four or five eyes; shift every year, shaking off a little of the old soil. In May last, I saw some as fine maiden Peach-trees in pots, in one of the London nurseries, as I could wish to see; and any one buying a few trees in the same condition would save a year's labour. They were making fine shoots in May last.—*W. Hutchison, Eatington Park.*

THE TANK SYSTEM OF HEATING.

This, for furnishing Pine stoves, Melon and Cucumber pits, and all structures for plant-growing, with bottom heat, instead of uncertain and unsightly fermenting materials, is one of the greatest boons for simplicity, utility, and economy in horticultural purposes ever yet acquired, and undoubtedly claims the praise and due consideration of every individual who wishes to see the truly interesting science of Horticulture improve and keep pace with the spirit of the improving times in which we live.

I would recommend all scientific and practical men to give the subject due and serious consideration: they should well discuss it in their own minds as well as publicly with others: in time much information would thus be gained; for amongst "a multitude of counsellors there is wisdom." There are several very essential points requiring serious discussion and due consideration, before the great advantages that are to be derived from this system are to be gained; such as, What are the best materials with which to construct those tanks, in order that they may answer all purposes in the most economical manner? What is the depth of water that should flow, so as to command the most kindly and uniform heat? What is the best mode or proper system for the water to flow from and return to the boiler? Which is the best-constructed boiler from which to obtain the greatest advantage in regard to regularity and economy? These, with some other items, require due consideration before introducing the tank system. They are most important questions. Some tanks are constructed of wood, cased or lined with zinc or lead; others are made of stone, bricks, tiles, and slates, cemented together, and in not a few instances they are formed with such solid walls and foundations of masonry, that it only requires a second thought to perceive the great loss of heat that must take place on account of the absorption of such materials. Again, all the above-mentioned materials are in some degree liable to get soon out of repair, and this may happen at the most critical season. Bad materials, or imperfect workmanship, &c., are apt to cause leakages, and in many cases those tanks are so constructed that it is no easy matter to discover where the imperfections are, so as to get them put again in repair. I shall not attempt to condemn those structures or their materials, but I must acknowledge I cannot highly recommend them without considerable alteration. Under all circumstances, even with my limited practice, I can see no material at the present time so likely to answer all purposes with the greatest advantage as cast-iron tanks, constructed on a good principle. The sides of the pit for holding the plunging materials over the tank might be of the same material, which could be cast plain or ornamental, according to taste, and if it were kept nicely painted it would have a very light and neat appearance; the whole might be carried on cast-iron supports, and placed upon a good base, with flag-stone under the iron support, which should be cast with a good broad base, similar to those in use for supporting corn-stacks, &c. The advantage of having tanks constructed in this way will be at once obvious. 1st. They will be neat and durable. 2d. There will be great advantages gained by the tank being thus made to assist in heating the atmosphere of the house, pit, or other building. This heat is in too many instances entirely lost to all useful purposes. 3d. There will be considerable heat given off from the bottoms and sides of tanks on the above principle, that will warm the atmosphere of the house. Another considerable advantage gained by setting a tank open and free on iron supports is, that there will be nothing to prevent warm air from circulating freely in all parts of the house. That our present structures admit of but a very unequal circulation of heat and air is very obvious to most practical men. Underneath the tank there would be both light and air, and the space would be found useful for growing early Rhubarb, small salads, starting various kinds of bulbs, Dahlias, or early Potatoes for growing in pots or for turning out into pits or frames; and many other things could in such a situation be forwarded. The iron supports could be cast square, so as sliding shutters could be fitted closely and neatly to them, to be taken in and out; they should be provided with ventilators at the top, or one opening, a few inches in depth, might be continued the whole way round, by which means the free circulation of heat and air would not be impeded. A famous situation might also here be formed for growing Mushrooms during the dark winter months, as well as for forcing the first crop of Seakale in river, sea, or other sand, or in old tan, at the season when it is not an easy matter to get it out of doors, on account of bad weather. I have found no difficulty in producing it in good perfection in a similar situation during the last three winters. This would likewise be found an excellent situation, when left quite open, for producing the first crops of Asparagus in November, December, and January. Thus, by foresight and persevering attention, the space underneath the tank could be made to produce various useful articles, that would go far towards defraying the expenses of fuel, where the tank is introduced on a good principle.

In pits and frames where there is no walk inside, but where what is required to be done is performed from the outside, as is generally the case with such structures, I should recommend that the tanks be borne on supports in the same way as above described, leaving a cavity of a few inches at the outside of the pit that contains, or should contain, the plants, fruits, &c., and the outside wall, which should be provided with ventilators, placed at intervals, for the purpose of admitting air both below the tank and above the pit. This would keep up a free circulation, and the air could be admitted either from one side or from the other, according to the state of the weather, or other circumstances: it could also be admitted at bottom or underneath the tank, and at top. By this means damping or fogging off, as it is termed, bleaching of plants, or any difficulty with regard to starting into fruit Pine plants when grown to maturity would never be heard of: cleanliness, health, and vigour would be obtained.

Some have formed this idea, and have actually put it in practice, viz., that when they obtained the tank, they had no further need for flues and pipes for heating the atmosphere of their houses and pits, thinking that the tank would furnish all that was requisite. In some degree the system I am now pointing out would effect that object; more particularly in the case of pits, which can be covered in bad weather. At the same time, even for pits, however, I would recommend that a flow and return pipe be always at the front; it need not be made use of except when it is requisite; no waste whatever would occur, the expense of pipe not being great. The command of pipes will be found useful in any structure when damp and foggy weather prevails, to dry up the moisture by turning on a little heat and giving air. How practical men can depend entirely on tanks, under the present mode of making them of solid walls and masonry, when so large a portion of heat is lost by being buried and absorbed, I am at a loss to guess. Surely this has not been duly considered. It is true that they may have gone on tolerably smooth and comfortable, and may have been able to obtain a sufficiency of heat during the last twelve months of fine weather: such a season we may never again see. But even under these favourable circumstances, I am doubtful if the required atmospheric warmth could at all times be fully maintained, without imposing a very unnatural bottom-heat for the plants, at the very time they required the most uniform temperature. Why should we dispense with the means at command for warming the atmosphere, because a great improvement is discovered for furnishing the required bottom-heat? While such things are kept in practice, I shall not be surprised to hear of much prejudice against the tank system. Does it not look very much like imposing on a good object, to rob it of its greatest merits? Allow nothing to be wasted—act in all things with some little foresight and judgment—and with the greatest possible economy under all circumstances; but do not draw your beverage from the spile-hole, and allow the greatest quantity to waste by the bung-hole. I have been a practical gardener for years before boilers and hot-water pipes were much used for gardening purposes, and have seen the great opposition and prejudice they met with in many localities, when they were first introduced for heating garden structures; they are, however, now happily sought after as much as they were then opposed, and a gardener now would be thought as far wrong in choosing a fire-flue for a hothouse or pit, in preference to boiler and pipes, as a courier would be in selecting an old hackney coach for travelling with expedition, in preference to the Great Western Rail.

Boilers have been made of almost numberless shapes and sizes, from the size of a man's hat to that of a large brewing-copper. Those constructed some time since were so unwieldy that they took an immense quantity of fuel and patience to heat them, and after all they did not maintain the good qualities they were said to possess, viz., superiority to others in keeping a more regular and uniform heat, when once made hot. It was forgotten that there was the same body for the cold to act on, as there was for the heat. Three persons of my acquaintance lost their lives by falling into those dangerous boilers, while adjusting and regulating the unnecessary apparatus then in use. In those times the more mysterious the construction of a hot-water apparatus, the more clever and more scientific the inventor was generally considered. Those ideas, luckily, however, seem in a great measure to have blown over; but still there are some such ideas yet put into practice, or why should men recommend a large body and depth of water to flow through a tank, in preference to a quick and uniform shallow flow and return? This is a point that requires discussion. Let us consider this subject faithfully; not falling back to the olden times, but commencing with the practically known and best proved system now in use, recollecting that we have but a short journey to travel, and that it is our duty to go through with it in the nearest way on the most friendly and neighbourly terms. Boilers of many shapes I have practised with; but I must acknowledge that three in use here at this time, constructed and fixed by Messrs. Garton and Jarvis of Exeter, possess great and superior advantages over all that have hitherto come under my notice; the last constructed one is still an improvement on the others. Tanks, I conceive, in order to obtain an advantage over those at present in use, should be double; that is, they should have two floors, one above and another below—the top floor, of course, taking the flow from the top of the boiler through the whole width and length of tank, passing over the opposite end, and returning by the bottom floor again to the boiler. The number of flow-pipes from the boiler may be regulated according to the extent and width of tank floors. I imagine that it would be of advantage to provide two flows to every tank above 4 feet in width; when three or four could be just as easily provided for tanks from 6 to 10 feet in width.

In the next age practical men will laugh and wonder how we expected anything like a kind and uniform heat from fermenting materials; and will then know how to turn those materials to better account, which are now to such an extent wasted. All tanks should of course be provided with ventilators, not for allowing the escape of evaporation, which should not be allowed by any means, but for the purpose of occasionally cleansing them out. And all pits, &c., provided with tanks that have no walk inside, should be provided with ventilators and trap doors large enough to admit a man to go underneath to paint, examine, and repair any imperfection, &c., that in time might happen. The best constructed pits—the best plunging materials—the best and most natural provision for turning plants out of their pots—and several other matters of importance, require due consideration, and I hope to see them all discussed on friendly terms.

Reference to Plan.

A The Plants standing in the plunging materials over the upper, or flow-floor.
B The Pit and plunging materials on the upper, or flow-floor.
C Coarse rubble underneath the plunging material, for the due circulation of air, heat, and water—one of the most essential provisions in the whole structure.
D Upper flow-floor.
E Under, or return-floor.
F Iron standards for carrying the whole structure to any requisite or answerable height.
G Flow-pipes from boiler.
H Return ditto.
I Openings at opposite end of flow-floor, for water to pass through, falling into bottom floor, or return-pipes at J.
K The Boiler.
L The furnace-door, &c.
M End view of the structure.

The above is a plan of a pit-tank, &c., conceived according to my ideas above described; but instead of having a bottom-tank or floor for the return of water to the boiler, it may be found in some cases advisable to conduct it in its return, in pipes—either immediately underneath the flow-floor, or at the front of the house, pit, or whatever kind of structure it may be, erected upon the above principle; under all circumstances, I should recommend the upper flow-floor to be constructed the whole width of pit, taking care to provide a sufficiency of flow-pipes to equalise the flow in a continual and regular manner.—*James Barnes, Bicton Gardens.*

Home Correspondence.

Pruning of Forest-trees.—By the *Chronicle* of the 19th ult., I perceive that the dispute between the pruners and the non-pruners has been recommenced, and does not seem to promise a speedy conclusion. Dr. Thackeray and his man are strong in the flourishing condition of their plantations, while Mr. Billington and "Quercus" are by no means disposed to admit the success of Dr. T.'s system. The parties even differ as to the principles of the food and growth of trees, as well as to the best mode of depriving them of their branches. Now it appears to me that, as far at least as theory goes, these matters may very easily be decided. The principles of vegetable physiology, relating to the growth of trees, are now sufficiently ascertained, and are shortly as follow:—The roots absorb sap from the earth; the sap ascends the stem, pervades the branches, is elaborated in the leaves, and descends towards the ground, depositing a layer of new wood along with the peculiar products of the tree. There is no doubt also but that a considerable portion of the carbon required to form the woody fibre is derived from the atmosphere. Reasoning from these principles, we must arrive at the conclusion that the more leaves a tree possesses (and consequently the more branches), the greater will be the quantity of sap elaborated, and the larger the fresh layer of wood. Therefore, to prune to any extent, is just to impede in a corresponding proportion the growth of the tree. As to the method in which pruning should be performed, if we amputate at once a branch of any size, we diminish in a certain degree the increase of the tree during the next two or three years; but if we cautiously foreshorten the same branch one season, and two or three after, cut out the remainder, we give the tree time to recover the loss, by the formation of new branches, and so render its growth more equal. If we adopt the theory (which I am disposed to believe), of the expansion of the leaves in spring being the cause and not the effect of the ascent of the sap, these inferences will be more evident. Theory, then, is in favour of the non-pruning system, and nature corroborates the advantages of it, by the immense stems which single trees often display, compared with their brethren of the plantations. But nature must sometimes be assisted by art, and in order to produce length of stem, and freedom from knots and inequalities (properties that are in daily requisition), we are forced to prune to a certain extent. "Quercus" asks, "What is judicious pruning?" And I think with him that this expression requires to be more correctly defined than hitherto. It were much to be wished that some practical man, who has pruned on scientific principles, would make known his experience on the subject. It certainly appears to me that neither Dr. Thackeray's principles nor his practice are the true ones.—*Dendrophilus.*——"L. L." says:—"I have planted largely for many years, and latterly, from practice and experience, with good success. 'As doctors differ,' I hardly think I shall ever feel disposed to try the experiment of cutting off an arm or leg, when weakness and infirmities come upon me, to make my body stronger. The theory is new to me, and somewhat startling. In pruning, one's predecessor may have neglected his woods, and forced upon those coming after him to use the saw and hatchet, to put them into goodly shape and order; but I uphold that they are great enemies to foresters generally, even in men's hands who consider themselves great tree doctors. In infancy, plantations should have your best consideration, and if for six or seven years you will 'teach the young idea how to shoot,' by pruning them, and keep them clean, all that is required afterwards, or nearly so, would be to cut down and give room for those trees most valuable in shape, kind, and quality (saving thereby labour and expense), to remain, and as they continue filling up again the ground, renew the attack from time to time, as the growth of the trees demand. It is, I fancy, a by-gone idea that there is great profit in planting, and the idea quite obsolete that planting your best land is more profitable, in the long-run, than sowing it with grain. Where land is not easily cultivated, poor lime stony land, the slopes of mountains, and, indeed, the summits of them, sandy plains, and steep declivities, I would say, might and do pay; at any rate, they would improve the bordering property, warm, and adorn it. I have seen lands planted on a large scale, too poor for culture and too bleak for turning into tillage, where trees have sprung up, and been cut down after 30 to 35 years' growth, except broad belts round twenty-acre fields; and those fields, from so many years' fall of the leaf, have borne the sweetest Grasses, and become very valuable sheep-paddocks. In such districts there is a strong incentive to plant, where you have an heir to reap the benefit of your outlay. Oaks will grow almost in any soil, by planting with them those good nurses, the Scotch Fir, Larch, and Alder. Give these air, sun, shelter, and attention when they are quite young, and clip their tender shoots with your fingers, rather than hack and hatchet them when the branches become strong, is the advice of one who Pontey'd in early life, but did not find it to answer."

Judicious Pruning of Forest-Trees.—"Quercus" asks, "What is judicious pruning, and how long is it to be continued?" Judicious pruning is every body's system who prunes at all—at least in their own opinion. Hence it is not easy to define it. The preventive system of pruning is that which I practise, and which comes near to "Quercus's" notion of "no pruning;" but the practice requires to be followed up occasionally on some kinds of trees, from a very young state until they are from 15 to upwards of 20 feet in height. The fine Larch in Mr. Gore's plantation, and the finest of others mentioned in a former communication, have had no scientific or judicious pruning by man. Mr. Gore's Larch had been surrounded by other trees, but not too near, which kept its branches within a moderate compass, and of a moderate size—just what the preventive system would effect. The same principle holds good with all other trees, when length, quality, and bulk of stem is required; consequently, very little pruning (lopping) will be required, if trees are properly trained on that system from a young state.—*W. Billington.*

Wilmot's Black Hamburgh Grape.—In looking over the report of the articles exhibited at a late meeting of the Horticultural Society, I observe that particular notice is taken of a Grape named "Wilmot's New Black Hamburgh." The berries are described as being "more fleshy, much larger than those of the old Black Hamburgh, and remarkable for having the surface covered with small indentations, as if they had been beaten with a hammer; the bunches beautifully covered with bloom." On referring to "Speechley's Treatise on the Vine," I find a Grape named simply, a Black Grape from Tripoli. Now, as this had been then only recently received direct from that part when Speechley was writing his Treatise, he had only fruited it very imperfectly in a pot; but Mr. Thompson afterwards had it planted into the diffused borders of the vineries, and the plants are now, as they were then, labelled "Black Tripoli," as is likewise the case at Worksop Manor. Now, the description of Wilmot's New Black Hamburgh so exactly agrees with the Welbeck Tripoli Grape, that I am much inclined to imagine it is one and the same Grape, which, from the indented surface of the berries, is usually distinguished by the name of dimpling. When the sun shines upon them they are readily seen to be very different from the Old Black Hamburgh, to which in general appearance the bunches have considerable resemblance, and in most places pass as such. This is a misfortune, as it is a much superior Grape, and often at Exhibitions takes the Hamburgh prizes, under the mistaken name of the Old Black Hamburgh. The Black Tripoli is a very different Grape from the Welbeck one, which may be said to be the very first on the list of black Grapes; and if judiciously treated has always fine black berries. It is as free a bearer as the Old Black Hamburgh, and continues much longer in perfection than that variety, on account of its being less tender in the skin, more fleshy and solid, and also more saccharine. The berries grow as close together on the bunches as do those of the Old Black Hamburgh, and the bunches therefore require to be timely and well thinned.—*J. Mearns.*

The Golden Pippin Apple.—In the *Chronicle* (p. 622) it is said, "That celebrated physiologist (Mr. Knight) considered the Golden Pippin Apple to be in the last stage of decay. This doctrine of the deterioration and degeneracy of some of our best old Apples is unquestionably opposed to analogy in trees generally." The late Mr. Loudon was also of this opinion. About a century back, a large portion of the Herefordshire and Shropshire orchards consisted of the Golden Pippin and other celebrated old fruits, most of which have long perished by age and disease. We are now as fond of good fruits and fine cider as our forefathers, and repeated attempts have not been wanting by planters to substitute these old fruits as orchard trees again, but all have hitherto proved unsuccessful. Upon a border of rich dry sand, against a low wall, I have now dwarf plants of these sorts in a good bearing state; and as yet they are perfectly free from canker. But this will not last. It is only the old man whose life is a little lengthened by being set at ease from toil and exposure in the chimney-corner. Rather than lose time and excite vain expectations in mooting so settled a point, it is much better to follow the track of the celebrated physiologist, in proving, as he has done, that the best old fruits, if not to be exactly re-organised, may be substituted by similar, or better, for ages to come. —*Qualfordensis.*

Rhododendron campanulatum.—Among the many ornamental shrubs that now decorate our pleasure-grounds, none are more deserving a place than this beautiful species, whose compact habit, fine dark sea-green, and curious rusty foliage, contrasting with the magnificent white blossoms, never fail to attract the eye, and stamp it as one of the best hardy evergreens we have. Seeds were first sent to this country by Dr. Wallich, from Gossaingsthan, a mountainous region to the north of the valley of Nepal. Many plants have been got by grafting, but they are found not to answer so well as from seed or layers.—*Fboracum.*

Shanking of Grapes.—Much has been said at different times in the *Chronicle*, on the shanking of Grapes, which the highest authorities have pronounced to be occasioned by the improper formation of the border in which the Vines are planted. Now, in the absence of facts, such authority, even when founded in theory, would be considered almost conclusive. I have it in my power, however, to relate a fact, which proves beyond all doubt that it does at least proceed from other causes also. About 20 years ago I prepared a border with the greatest care, the plan of which was submitted to and approved of by the late venerable President of the Horticultural Society. The Vines grew the first year with extraordinary vigour; and in the second produced a considerable quantity of fruit, much of which "shanked off," as gardeners oddly term it, and this has been the case more or less ever since, although the mode of treatment has undergone various changes. About 12 years after planting, being desirous of introducing bones and other materials into the border (which averages about two feet in depth, upon a close pavement of brick, placed upon a stratum of lime-rubbish, over one of gravel, upon a perfectly dry natural bottom of blue schistus), I had it turned over, and was much surprised to find almost all the roots near the surface. Most of them were replaced in a similar situation, and the remainder a little lower. Now, if we consider that in the first instance it was highly improbable (if indeed possible), that the roots could have penetrated into anything ungenial, and that subsequently, nearly all the roots were found near the surface, it appears almost certain that the cause usually assigned could not operate here, and must be sought for elsewhere. From long and tolerably close observation I am inclined to suppose that it might be occasioned by moisture collecting on the stalks of the Grapes during night, and the rays of the sun falling suddenly upon them, in a heated and confined atmosphere, before such moisture was sufficiently dissipated. If so, the present system of hot-water gutters may prove very prejudicial, which I have some reason to fear is the case, from the more than ordinary quantity of shanked Grapes in two divisions of my vinery this year, heated by tank gutters; whereas, in an adjoining division warmed by other means, there was no perceptible difference. Where the gutters were used, I also observed that many of the largest Vine-leaves damped off and fell, having rotted near the base of the foot-stalks. I hope that the attention of practical readers will be drawn to these points, as it may assist in clearing up the mystery that hangs over this subject.—*An Amateur.*

Thrips, &c.—The following paper, On a Simple and Effective Mode of Killing the Red Spider, Green Fly, Thrip, and Scale, without injury to Plants, was read at a meeting of the Horticultural Society of London, 2d August, 1837:—"Put the pots or plants into a frame well closed, and then Laurel-leaves bruised between them, when in the course of an hour the whole of the spiders and flies will be destroyed by the odour, which is that of Prussic acid; the thrip and scale will be destroyed in about eight hours—the night time being the most favourable for the experiment. For a house of 20 feet by 12, two bushels of leaves would be amply sufficient." I have not tried this mode of destroying these insects, but should like much to know if it has been proved to be successful in every case, it being a very superior method of extirpating such pests.—*Delta.*

Destruction of Green-fly.—I wish some of our chemists who are fond of floriculture would give their attention to the destruction of these pests of our greenhouses and frames. What we want is something as effectual as tobacco-smoke, cheaper, and of more easy application. I would suggest they should endeavour to supply us with some preparation in the form of pastiles, combining the above essentials. The demand would be very great. If nothing can be found to take the place of tobacco, a preparation of it in the above form would be very useful, enabling amateurs and ladies to keep this troublesome insect under. It should be remembered by such as may incline to give attention to the subject, that in filling a house with tobacco-smoke, it is necessary to keep some damp hay upon the top of the tobacco, to prevent the heat of the smoke scorching the plants, and to be most effective, it should be produced very rapidly. An ample reward would attend success, but nothing should be offered to the public that has not the recommendations above named, viz., destruction of the insect, simplicity of application, and both combined with economy.—*E. N. Beck.*

Marc de Colza.—I observe in a late Paper, speaking of manure for Tulips, that Colza is explained to be a kind of Rape grown about Caen; and it is asked whether oil-cake will do as well as Marc de Colza. The fact is, that Marc de Colza is oil-cake; Colza being the common name for the Rape-seed so much cultivated for oil in the north of France and Belgium.—*G. O.*

Peas.—As the time for planting Peas is fast approaching, it may be of service to know that the first plants may be preserved from mice by simply saturating them in a strong solution of Bitter Aloes.—*Early Charlton.*

Societies.

HORTICULTURAL SOCIETY.

Nov. 5.—The Rev. J. Antrobus in the chair.—In consequence of the darkness of the day, this meeting was held by gas-light. Among plants, perhaps the most remarkable object exhibited to the meeting, on this occasion, was a beautiful cut specimen of Renanthera coccinea, from Mr. Webster, gr. to Mrs. Huskisson. This Chinese plant, which is one of the oldest of its class imported by the Horticultural Society, is common near Canton, where it delights to scramble over old walls, on which its large spikes of rich scarlet flowers have a very imposing effect. Although Mr. Webster stated that this was the sixth season in which this plant had bloomed successively with him, yet it does not flower in this country with any certainty: and it seems by accident that the desired effect is produced. This is the more to be regretted, for the flowers continuing open for a considerable length of time, are very useful for drawing-room decoration. A Banksian Medal was awarded for it.—Of other Orchidaceous plants F. G. Cox, Esq., sent Lælia Perrinii, a beautiful species, and the rare Cattleya pumila, which is the least handsome of that genus.—From Mr. Robertson, gr. to Mrs. Lawrence, were good plants of Galeandra Baueri, Mormodes citrina, a finely-grown specimen of Epidendrum nutans, covered with large clusters of green-coloured blossoms; the old Cypripedium venustum, Lælia Perrinii, Saccolabium denticulatum, and Stanhopea venusta, the latter producing a fine spike of yellow blossoms.—From the same collection were also Erica Banksiana purpurea, and Lamberti rosea, the latter covered with small flesh-coloured

blossoms; and a cut specimen of the old Spermadictyon azureum, a fine autumn-flowering greenhouse plant from the north of India, with pretty bluish-gray flowers. A Knightian Medal was awarded for the four first named plants.—From Mr. Jack, gr. to G. Loraine, Esq., was Pleroma Benthamianum, a Melastoma-like plant, with beautiful deep violet blossoms, and a specimen of Oncidium Lanceanum. A Certificate was awarded for the Pleroma Benthamianum.—Mr. Cuthill, of Camberwell, sent Leianthus nigrescens, a plant nearly related to Lisianthus; it was about 7 feet in height, and covered with a multitude of nearly black star-shaped flowers. A Certificate was awarded for it.—From Mr. Tant, gr. to E. Johnston, Esq., was a box containing blooms of Chrysanthemums, all of which were very fine flowers. A Certificate was awarded for them.—Messrs. Chandler and Son, of Vauxhall, also sent a box of Chrysanthemums, containing fine blooms.—From Mr. Jackson, of Kingston, was a well-grown specimen of Statice macrophylla, which is one of the most handsome of the arborescent kinds. A Certificate was awarded for it.—Mr. W. P. Ayres, gr. to J. Cook, Esq., received a Certificate for a plant of Achimenes picta, in fine bloom: this was stated to have been grown in an intermediate house, the night temperature of which rarely exceeded 55°, and was frequently below 50°. The general impression among cultivators is, that this plant will not produce flowers sufficient at one time to make a first-rate specimen; but half-a-dozen plants in one pot, as profusely covered with bloom as the one sent, would present a beautiful appearance. As a plant for winter decoration, or cutting for small bouquets, it is certainly one of the finest things that has been introduced for a number of years.—Messrs. Henderson, of Pine-apple-place, received a Certificate for an exceedingly well grown specimen of Æschynanthus grandiflorus, which was also finely covered with bloom. From the same collection were also the sweet-smelling Cestrum viridiflorum; the larger variety of Rondeletia speciosa, Boronia pinnata, together with Epiphyllum truncatum, growing on a block like an Epiphyte, by which treatment it is said to flower much better, and to have a very pretty effect. The same group likewise contained four Heaths, viz., Westcottia, exurgens, Sebana viridis, and pyramidalis, the latter profusely covered with small flesh-coloured blossoms.—Of FRUIT, there was a considerable quantity. Mr. G. Maude, gr. to E. C. L. Kay, Esq., sent two Providence Pine-apples, the largest of which weighed 7 lbs. 11 ozs., and measured 9 inches in circumference, and 18 inches in height; the number of pips were 12. They were excellent specimens of good cultivation. A Banksian Medal was awarded for them.—From Mr. Fleming, gr. to the Duke of Sutherland, was a beautiful specimen of the famous Cabul Melon, which weighed 5 lbs. 13 ozs., and measured 21 inches in circumference. Mr. Fleming stated that he had cut three of the same kind, weighing together 18¾ lbs., from plants grown in a vinery, under the shade of Vine-leaves. The Melons he cuts at this season he wraps in paper, and then lays them in a basket, the sides and bottom of which are also covered with paper; he then lays a sheet of paper over the whole, and places the basket in a Pine-stove for a period of 8 or 10 days, by which means the fruit acquires an excellent flavour, and is esteemed a great acquisition to the dessert during November. A Certificate was awarded to the one sent.—Mr. Fish, gr. to H. H. Oddie, Esq., sent a green-fleshed Cassawba Melon weighing 3 lbs. It was stated to be the produce of a second crop from the same plant. Mr. Fish also sent specimens of the Beurré Diel Pear, and good bunches of Black Hamburgh Grapes, which were cut from a house where no fire-heat had been employed. These, although good, were, however, inferior to fine bunches of the same, which were exhibited by G. Crawshay, Esq., of Colney Hatch, who has for some years past grown excellent Grapes without the aid of fire-heat. Slight fires are occasionally lighted about the beginning of November; not, however, with a view to ripening the Grapes, but merely for the purpose of keeping out frost and drying up damp.—Mr. Crawshay also sent specimens of an unnamed Plum, apparently the Late Imperatrice, in fine condition.—From Mr. Jones, gr. to Sir M. Disney, were bunches of Black Hamburgh Grapes, each weighing 1 lb. 5 ozs.; and of what is called Wilmot's Dutch Hamburgh, each weighing 13 ozs.—G. H. Ward, Esq., M.P., sent a bunch of an unnamed black Grape, weighing 14 ozs. It was stated to have been cut from a young Vine, the fruit of which was just becoming fit to be gathered. The berries were large and juicy, not very high flavoured, and the bunches were said to hang extremely well, without mildew.—Mr. Hammond sent from Jersey single specimens of the following Pears, viz. Chaumontelle, Colmar, Passe Colmar, Duchesse d'Angoulême, Supreme (Catillac), Beurré d'Aremberg (Glout Morceau), Bergamotte de la Pentecote, St. Germain, and Marie Louise. These were all of them excellent fruit, and showed to what perfection such varieties could be brought in so famous a Pear country as Jersey is. Mr. Hammond also sent specimens of his Seedling Apple, called Hammond's Pippin, a fine-looking well-tasted variety, concerning which he states that it is fit to be eaten in a short time after it has been gathered, and lasts nearly as long as the Nonpareil. The blossoms are produced very early, and the fruit remains late on the tree, which thrives best in a warm situation well exposed to the sun. A Certificate was awarded for the three first-named Pears.—From Mrs. Waller, Menhall Hall, near Wolverhampton, were specimens of a Pear called the Tettenhall, which was stated to be one peculiar to that neighbourhood, abounding in the village of Tettenhall. It is some hardy wilding, unfit to be eaten, being very hard and gritty. It was, however, found to be a good baking Pear, and useful for preserving. It is an abundant bearer. This Pear, which is sometimes also called the "Girder," is sent in large quantities to Manchester, where it is used in dyeing buff; the fruit is said to produce the only buff dye that will bear washing without fading. Mrs. Waller also sent specimens of what is called the English Orange Apple, which has the recommendation of being a good keeper, and likewise of being a good table fruit as well as a good baking Apple. The trees were said to be good bearers.—Mr. Dunsford, gr. to W. Everett, Esq., sent a brace of Cucumbers that had been grown in a M'Phail pit, one of them measuring 19 inches in length. Mr. Dunsford also sent a single specimen of an improved kind, being a cross between the Syon House and a Black Spine variety. This measured 17 inches in length, and had been grown in a house heated by hot water, for which this sort was said to be well suited, being strong in habit and an abundant bearer.—From the Garden of the Society were Erica cruenta, refulgens, and vernix, Begonia acuminata, Catasetum Claveringii, Oncidium ciliatum, and Phycella obtusa, a greenhouse bulb, which was sent from Peru by Mr. Hartweg, having scarlet and green blossoms, which have considerable resemblance to those of P. chloracra, also Hippeastrum aulicum, Crinum amabile, Cypripedium venustum, an oblong scarlet fruit, about 6 inches in length, that was cut from a species of Trichosanthes, sent by Mr. Fortune from the northern parts of China, and a specimen of Lyperia pinnatifida, a plant which everybody can grow, and which would be useful for those who have small greenhouses, as it continues to produce its pretty violet blossoms during the whole year.—The following fruits were also sent from the garden of the Society, viz.—Napoleon, and Althorpe Crassane, the latter possessing a rich Crassane flavour, notwithstanding its green appearance, which is against it in the market, where it is not known—it is a hardy and an excellent variety; Figue de Naples, a great bearer; Forelle or Trout Pear, which is beautiful beyond all others, and its flesh is delicate and free from grit. Beurré Diel: this is rendered melting and much improved in flavour by being kept in a temperature of about 60°, for a fortnight previously to its being used; Pomme (Poire); Belmont, one of Mr. Knight's hardy varieties; and Duchesse d'Angoulême, which from a standard, although smaller, is better flavoured than from a wall. Of Apples there were Court of Wick and Claygate Pearmain; the latter partakes of the flavour of the Ribston Pippin; Golden Reinette—this cankers in some situations, but, nevertheless, deserves a place in every collection; Blenheim Pippin; Stagg's Nonpareil, Waltham Abbey seedling; Gloria Mundi, Alfriston, Rymer, and Dumelows seedling; the latter is a very valuable kitchen sort.

LINNEAN SOCIETY.

Nov. 5.—E. FORSTER, Esq., in the chair.—A paper was read by Professor E. Forbes, on the Medusa proboscidialis of Forskal. He had found this animal in his late voyage up the Mediterranean, off the coast of Lycia. He went into a detailed account of the anatomy of this animal, in which he differed from previous authors in assigning to a remarkable proboscidian process developed from the concave under surface of the animal, the function of a stomach. The author had also observed that this animal had the power of lengthening or shortening its tentacles, thus rendering the length of these organs quite inconclusive for specific characters, or for indicating age.—Several presents were announced by the Secretary; among others, a collection of Dried Plants from South Africa, by Dr. Wallich; a collection of Plants from New South Wales, and of Seeds from the Cape of Good Hope, by T. W. Mann, Esq.; a collection of Dried Fruits from India, by T. S. Ralph, Esq., containing specimens of Feronia elephantum, Anona reticulata, Butea frondosa, Adansonia digitata, &c.; a section of the trunk of the Cabbage Palm, and specimens of Dried Fruits, by Dr. Frederick Farre; cones of Pinus macrocarpa, by Messrs. Knight; the Fruit of Martynia fragrans (*Lindley*), by J. Janson, Esq.; specimens of Equisetum Tremondii and Spergula stricta, by Messrs. Backhouse and Gibson, from whom also letters were received descriptive of the localities in Great Britain in which these plants were found; Specimens of Leersia oryzoides, a new British Grass found near Henfield by Mr. Borrer, by E. Forster, Esq.; Specimens of Galium Vaillantii, found near Saffron Walden, by Joshua Clarke, Esq. A collection of Modelled Fruits, mostly of tropical plants, was exhibited; they were exceedingly beautiful, and were made by M. Cros, in the island of Bourbon, with whose death, it is said, the mode of preparing them was lost. There are upwards of 4000 specimens in the collection.—Mr. Quekett exhibited, with the microscope of the Society, some fossil animalcules from America.—The new Part of the Society's Transactions was ready for distribution. Professor E. Forbes read his own paper, and exhibited diagrams on a black board; and the paper was listened to with marked attention. We are glad to find the Council thus disposed to make arrangements to render the dull sittings of this Society more attractive.—*L. E.*

MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

(*Concluded from last week.*)

TUESDAY, Sept. 30.—There were two Papers read in the Section to-day, of which we shall give an abstract. The first, which perhaps is one of the most remarkable that was read before any of the meetings of the Association, was by Professor E. Forbes, on the Morphology of the Reproductive System of Sertularian Zoophytes and its Analogy with that of Flowering Plants. The Sertularian Zoophytes are those animals known in the Zoological scale, and which have a plant-like form, and were at one time supposed to be sea-weeds. These animals are composed of numerous nutritive individuals, which, beside the life of each, share in the common life of the whole: there appear, on the axes or branches, various formed bodies, in some species urn-shaped, in others pod-shaped, very dissimilar from the other parts of the whole, in which, after a time, the ova are formed. These bodies, Professor E. Forbes maintains, are branches of many individuals, which have undergone an ideal metamorphosis exactly comparable to that which Linnæus first, and Goethe afterwards, demonstrated in the flowers of vegetables. The following is the statement of this theory:—The vesicle is formed from a branch or gemma through an arrest of individual development, by a shortening of the spiral axis, and by a transformation of the stomachs (individuals) into egg-producing membranes, the dermato-skeletons (or cells) uniting to form the capsule or germen; which metamorphosis is exactly comparable to that which we found in the reproductive organs of flowering plants, in which the floral bud (normally a branch clothed with spirally arranged leaves — an assemblage of respiratory individuals), is constituted through the contraction of the axis and the whorling of the individuals borne on that axis, and by their transformation into several parts of the flower. In order to prove this theory, the author submitted the several forms of ovigerous vesicle in the family of Sertulariadæ to a searching analysis, taking the pod-like vesicle of most Plumulariæ, usually regarded as the most complex, but in reality the simplest, as a type. He showed that all the classes of forms, six in number, may be explained by his proposed view of their nature, which is further borne out by certain monstrosities which have occurred among the zoophytes. The Paper concluded with an application of these principles to the systematic arrangement of the various groups of zoophytes.—This Paper was followed by a discussion, in which Mr. OWEN, Dr. R. LATHAM, and Dr. W. B. CARPENTER took part. Mr. OWEN pointed out the importance of applying the principles of transcendental anatomy. This working out the analysis and relations of parts by the idea of resemblance, gave a new handle to science, and was a method which in every department of natural history was producing great results. In this Paper of Mr. Forbes's, by one single thought the whole of those laborious researches of Ellis were reduced to order; and harmony and arrangement appeared where confusion and wearisome detail existed before.—Dr. W. B. CARPENTER observed on the close analogy between the reproductive capsules in the Campanulariæ and the thecæ of Mosses, and referred to the abnormal form of Moss observed by Mr. Edwin Quekett as confirmatory of the theoretical structure of the reproductive organs of that family. The second Paper was on the Forest-trees of British Guiana, and their Use in Naval and Civil Architecture, by the CHEVALIER SCHOMBURGK. The author drew attention to the noble forests of a colony which most appropriately has been styled "the magnificent," and especially dwelt upon the superiority of the timber which is obtained from the Mora (Mora excelsa), and the Greenheart (Nectandra Rodiæi). The wood of these trees is already extensively employed in ship-building; and large cargoes, chiefly of the Greenheart, are exported from the colony to Liverpool and the Clyde. This Paper was accompanied by upwards of 100 specimens of wood from British Guiana, many distinguished by great beauty, and qualified to add materially to the list of ornamental woods now imported in England. Among them were chiefly the following:—Cartornyeh, Surabadani, Ducaballi, or Guiana Mahogany wood; Ducaliballi, Haiawaballi, Hubaballi, &c. The beautiful Letter-wood (Piratinera Guianensis), which is likewise known under the name of Snake-wood, particularly deserves to be mentioned. One of the most remarkable among the specimens exhibited was a section of the trunk of a forest-tree of Guiana (the *Aspidosperma excelsum*, Benth.) the trunk of which has entirely the appearance of a fluted column, and is so curious that it offers apparently the only instance of such a curious structure among dicotyledonous trees. The author likewise drew attention to the nest of that beautiful bird the rock manikin, or cock of the rock (*Rupicola elegans*, Cuvier): and to the head of the largest fresh-water fish known, the Sudis gigas of Cuvier, both of which he exhibited, reserving some observations for another period.—*L. E.*

STAMFORD-HILL, CLAPTON, AND STOKE-NEWINGTON GARDENERS' ASSOCIATION.

Oct. 28.—The Treasurer in the chair. At this, the second half-yearly general meeting of this Association, the Report of the Committee on the financial state of the Society was read by the secretary, Mr. Sherwood. It showed that the total amount of money collected during the whole year was 43*l.* 10*s.* 10*d.*, and that the year's expenditure was 39*l.* 15*s.* 5*d.*, which left, in favour of the Society, a balance of 3*l.* 15*s.* 5*d.* The following remarks, explanatory of the objects, operations, and prospects of the institution were also read:—"At the termination of one year's labour, a review of our proceedings must, we think, afford to all both encouragement and delight. We commenced this Society twelve months ago, depending for success entirely upon our own exertions; but no sooner had we begun to work than most efficient pecuniary assistance was rendered by our esteemed president, R. Hanbury, Esq., F.H.S., whose example was

followed by J. Janson, Esq., J. R. Mills, Esq., J. Foster, Esq., E. Johnson, Esq., and by Messrs. Fraser, Low, Smith, and other nurserymen in the neighbourhood. Here we had a happy proof of the willingness of gentlemen and nurserymen to help gardeners, when gardeners were willing to help themselves. Again, we were very fortunate in obtaining the use of the Lancasterian school-room for our meetings, which is not only suitable, both in point of accommodation and situation, but it must afford us much pleasure to reflect that the money we pay in rent goes, every penny of it, towards educating the children of many of our members. It was thought by some, that this Society would dwindle into almost nothing, as soon as the novelty was past; but we need not say there has been no indication of this, even in the busy months of summer. We have no less than 183 members, and, instead of that number being likely to diminish, there is every probability of its being considerably increased, judging from the cheerful manner in which members are coming forward to repeat their yearly subscriptions, and to propose the names of other persons for membership. We have members who regularly attend our meetings from parishes adjacent, some three, four, five, and even eight miles distant. Many papers have been read by members on practical subjects, which would reflect credit upon an older Society. Our discussions have been lively, temperate, and instructive, even to those who have not taken a part in them; this, we think, will be believed when our Transactions are published, as we trust they will be shortly. As to the order and good-feeling that has pervaded all our meetings, we think the history of such Societies scarcely presents a parallel. Those who framed the rules of this Society believed that it would not only be superfluous, but grossly insulting to gardeners to introduce one word of prohibition of drinking, smoking, or low expressions. Shall we say that time has demonstrated the justice of their opinions? Yes, it has done more. Now let us for a moment glance at the privileges which the members of this Society enjoy. Here we have a library already consisting of upwards of 140 volumes, mostly botanical and horticultural works, but embracing also those of the kindred sciences, as well as general literature; any of which the members are permitted to take to their homes, and peruse at their leisure. Next are our monthly lectures on the various branches of science, delivered by gentlemen of undoubted talent; of the value of these it is quite unnecessary to say a single word. And lastly, we have our classes. Here young men are instructed in the most modern systems, and, by professional teaching, Arithmetic, English Grammar, and the Latin language; arrangements are also completed for a class to study the French language, to which we hope to add Mensuration, Drawing, Botany, and other useful subjects. This is the account we have to render of our proceedings for one year. We believe that the machinery thus brought into action, if supported by the brotherly co-operation of ourselves, and the sympathy of our employers, will work such a reformation of character and habits in all within the sphere of its influence, as shall tend to the dignity of mankind, the prosperity of society, and the honour of Him who is the disposer of all events, on whose overruling providence we humbly rely." The report having been adopted by a unanimous vote of the members, a highly interesting Paper was read on the Cultivation of the Pine-Apple, by Mr. G. Castle, foreman in the gardens of J. Trueman, Esq., Walthamstow. It described the natural habits of that plant; also its native habitats in reference to heat, light, soil, &c.; its introduction and subsequent treatment in this country. He contrasted the simplicity of modern systems of cultivation with those of our predecessors—explained the manner in which successive improvements had been wrought, for the purpose of pointing out the probability of further improvements being effected—reprobated the practice of disrooting, frequent shifting, and the application of gross manure. He gave an epitome of his own practice, and a list of what he considered the best sorts of Pine-apples in cultivation. A discussion followed the reading of this Paper, on several important points connected with the subject, and was kept up by Messrs. Tant, Moore, M'Elroy, Sherwood, and other members. The subject announced for the next meeting, which will be on the 11th inst, is a Lecture on the Structure of Plants, to be delivered by W. Woollaston, Esq., of Lower Tottenham. At the termination of the proceedings, Mr. Sherwood said he would take that opportunity of informing the meeting that he had a pet project which he wished to introduce; it was simply this:—That as many of the members as thought proper, should form a kind of Reading Society. That they should meet every Saturday evening at 7 o'clock in the Society's Class-room, Church-street, Stoke Newington, for the purpose of reading any valuable horticultural periodicals, or works which it might be deemed proper to introduce. The use of the room for two hours could be obtained for 1*s.*, firing, lighting, &c. included, which, supposing there were 24 members, one halfpenny each would pay, and a like sum would find them in papers for their use. Respecting the plan, he proposed that one of the members be appointed chairman, who should open the proceedings by reading the Leading Article; and afterwards that every other member who chose, should read a portion in his turn, and that as soon as the reader had finished an article, the members should be at liberty to make any observations they pleased upon it, at the same time correcting any bad pronunciation on the part of the reader." Having thus briefly related the plan, a very few observations will suffice to explain the object. They are—first, to collect a large amount of information, and bring it to bear upon each of the theories propounded by horticultural writers, in order to detect errors, if any, and avail ourselves of the instruction they may convey. Secondly, to instruct each other in the art of reading and speaking correctly, which will of necessity induce habits of mental application. And lastly, it will secure to the young and friendless members of our profession in the nurseries, an opportunity of hearing the opinions of more experienced men; which may furnish them with ideas for the week, and perhaps give to their minds a direction that will lead them on to respectability and honour through life. No one can be insensible of the evil of young men assembling in public-houses; but in vain will rigid morality deprecate the practice, until Christian philanthropy has removed the cause. It is not true that men are naturally inclined to frequent public-houses; but they are naturally inclined to seek the company of each other; and where are they to enjoy that, with scanty means, but in such places as will afford them accommodation? Let us reflect for a moment on the condition of a young man who leaves his friends and home, to reside in the neighbourhood of London. The comforts of a lodging, paid for out of 12*s.* or 14*s.* a week, it must be admitted, are indeed few; gloomy and sad he comes into a town like this on a Saturday night, to procure provisions; unknown and uncared for, he looks about for some place where he may rest and refresh himself, and finds that the public-house is the only place that will afford him that indulgence; here he is tempted to seek it; he meets with agreeable company, spends an hour in pleasant forgetfulness of his own solitary condition, and returns to his lodgings with a lighter heart. We all know what this is too likely to lead to, and we do not forget to censure it. It would be far better to endeavour to prevent it. I see no reason why the proposed plan might not be adopted in every town and village in the kingdom; no sacrifice would be involved in the experiment, and depend upon it there is humanity enough left in the world to insure its success. I have only to add, that I will be in the room I have named, with the *Gardeners' Chronicle*, on Saturday evening next, and invite all who are favourable to the object to meet me there.

COUNTRY SHOW.

Uxbridge Celery Show, Nov. 5.—At this Show a numerous and respectable attendance of amateur and practical growers of this esteemed esculent came forward to compete for the prizes offered by the Society. The specimens shown, taken as a whole, elicited from the visitors present high encomiums, in regard of the size, quality, and culture. Award of the Judges:—1st, a Silver Cup, value £1, Messrs. Brown and Attwell; 2d, Mr. E. Cooke; 3d, Mr. Giles Wall; 4th, Mr. E. Clarke; 5th, Mr. Giles; and 6th, Mr. Weedon. It did not appear that the competitions were confined to any particular kind, as both red and white were shown for the same prizes. Competitors were bound to show 3 heads, each weighing not less than five pounds. One of the heads shown by Mr. Cooke, the winner of the second prize, attracted particular attention from its beauty and very superior growth; the name of the variety shown by Mr. Cooke is *Wall's Invincible White*, we believe first raised by Mr. Giles Wall, of Victoria Nursery, and winner of the third prize.—*A Subscriber, Uxbridge.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

PHLOX VAN HOUTTEI. Van Houtte's Phlox. (*Hardy Perennial.*) Polemoniaceæ. Pentandria Monogynia.—Phloxes may with propriety be registered with the most showy and valuable of hardy herbaceous plants; latterly many beautiful additions have been made to the varieties in cultivation by hybridising; and almost every shade of colour now exists, from pure white to a fine crimson purple. The present variety has originated in this way, by intermixing one with pale flowers with a dark-coloured one; and as it bears a close resemblance to *P. suffruticosa*, in its stem, lanceolate, shining leaves, and dry pistil, and also in the arrangement of the inflorescence, it is more than probable that that species has been one of the parents. The other has doubtless been some of the taller-growing kinds, as Van Houtte's variety reaches a yard in height. The chief peculiarity is the rich purple streak down the centre of each petal. The metropolitan nurseries and gardens contain several varieties of a like character, indicating the same origin, by the similarity in their leaves and flowers, which can scarcely be said to differ. One of these, called Princess Marien, has also a purple stripe down the middle of the petals, but the colour is intermediate Van Houtte's and the line of white in the margin is much narrower. Another variety, known by the name of Alvardii, has bright crimson purple flowers with irregular streaks of white, and is a more beautiful and showy flower than the last. *P. bicolor*, a seedling raised by Mr. Beckett, of Ealing, is also an interesting variation, the eye of the flower being bright rosy-purple, and the remainder white, or a very pale blush. In common with other Phloxes, these only require a moderately rich soil to produce vigorous specimens, and they admit of being extensively increased by cuttings of the young growing shoots, inserted in sand, and placed in a pot or frame with a very trifling bottom-heat. Plants may also be obtained by division of the roots. Planted rather closely in large beds on a lawn, and the shoots bent down, as soon as it can be done without danger of snapping them asunder, and pegged to the ground with hooked sticks, they speedily cover the entire surface, and when the ends have regained an upright position and expand their flowers, they have an imposing appearance. There is, moreover, an additional advantage in pursuing this treatment; for the recumbent posture of the stem encourages the formation of lateral shoots, which flower successively, and lengthen the period of the attraction, as well as increase the density of the mass. Much of the beauty of such a bed, however, depends on the regular distribution of the shoots over the surface. If permitted to grow upright, in the usual way, the central shoot should be topped to induce them to become bushy, or several plants should be put in together. The present variety was obtained by the London Nurserymen last year from M. Van Houtte, of Ghent, but whether it originated with him or not, is unknown.—*Paxton's Magazine of Botany.*

LONICERA DIVERSIFOLIA. Various-leaved Fly Honeysuckle. (*Hardy Shrub.*, Caprifoliaceæ. Pentandria Monogynia.—In many respects this Himalayan shrub is much like the common Fly Honeysuckle (*L. Xylosteum*), from which it principally differs in its flowers being nearly or quite stalkless, and much larger. Dr. Wallich first received it from the mountains of Gurwhal; he afterwards procured it from Kamaon. According to Dr. Royle, it is common on the mountains of the North of India. In a wild state it sometimes becomes small-leaved, and approaches the common Xylosteum, but its stalkless flowers still distinguish it. By some mistake it is included by De Candolle among his Nine Cases—a set of climbing twin-flowered species, which belong to the genus Caprifolium. This is a middle-sized shrub, which thrives in any good garden soil, and flowers during the months of May and June. It is easily increased by cuttings of the half ripe wood, if treated in the same way as those of the common Honeysuckle. It was raised from seeds received from Dr. Royle from the North of India.—*Bot. Reg.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Conservatory.—Chrysanthemums, Cinerarias, and Salvias are the leading plants that flower just now among the more hardy kinds. Hedychiums, Vallotas, Clerodendrons, and Lantanas are just over, and are removed to the stove; the first to be dried and the other three to be shook out of the pots, put into small pots, and plunged in bottom heat. This is hard treatment, which would ruin some plants, but they will bear it. Justicias, Eranthemum, Aphelandra, with Gesnera zebrina and Cactus truncatus will take their place. Large specimens of Crowea saligna, Lucculia gratissima, and even the old Correa alba glauca make a good mixture with Chrysanthemums. The Lucculia, Gesnera zebrina, and Cactus truncatus are the best of these for placing in rooms. The old scarlet Achimenes can be had later than any of the new ones, and as early in summer as any of them. In order to have them in flower to the end of the month, we allow them to push in a cool place early in summer, then plant them out in sandy peat in a cool house on a front shelf or stage; from this situation they are potted from August to the end of September, and encouraged by giving them a little heat as we want them: the whole family is well worth room for. This season we tried *A. longiflora* in peat borders, under a wall, in different aspects, but it did it the good.

Greenhouse.—This house must always be kept well ventilated, and especially during this month; on that account the plants will require to be looked over often to see that none suffer for want of water. Where good cold pits are at hand, Heaths and many other plants are much better in them than in the greenhouse, unless the weather becomes severe, indeed, in these days, when so much attention is paid to forcing all good plants into fine specimens, little plants in small pots ought not to be kept in frames, if only to keep them out of sight, as these things are of little interest to any one except to the person who must provide for them, however necessary they may be to keep up a collection; in that case specimen plants will have more freedom, and not half the watering now done in the house will be needed; consequently less water will be scattered, which creates dampness among the plants.

Pits, Frames, &c.—In the forcing-pits, mild moist spring weather should prevail. Those plants in bottom heat should have it regularly. Fire, leaves, &c. are troublesome compared to the steadiness of hot water for bottom-heat. A moist atmosphere is always congenial to forced plants, and the more bushy they are the more they stand in need of the syringe. Insects should be kept down as soon as they appear; and let everything be kept in a clean and sweet condition. Cyclamens that have made good roots will stand forcing for a short time, and will soon throw up their blooms; but, like bulbs of all sorts, they are injured by forcing before their roots are made.—*D. B.*

III.—FLORISTS' FLOWERS.

Our Tulip-growing friends will have to wait some time before their beds will be safe enough for the reception of their bulbs. The rainy weather we prognosticated has arrived in good earnest, having continued now several days without intermission. The bulbs must be carefully looked over, for when the spike elongates, green fly is apt to attack them. Cotton wool at the bottom of the petals will now be found serviceable, preventing in a great measure the injury which the protruding flower is sure to receive if the bulbs are moved much, without this precaution. The first favourable opportunity must be taken to [illegible] them in. *Auriculas.*—Such weather as this is far more prejudicial than frost: and we must be excused for again strongly urging constant attention and watchfulness. *Polyanthuses.*—Some new varieties we see are advertised. Having grown them, we may say something about their merits. Hudson's Lady Grey is a decided improvement on Dalton's Earl Grey, and is a neat and pretty flower. Negro Boy, as its name implies, is intensely black, with a bright yellow lace, rather apt to crack in the eye, which will prove a drawback. Lady Lincoln, as its name implies, is a fine shaped flower; the centre full large in proportion to the ground colour, but occasionally it may be done very good. Red Rover, a second-rate flower and a scarce class. *Carnations*—ought all to be well established in their winter quarters; too much wet is highly prejudicial, especially to those recently potted. *Pinks.*—The beds must be kept free from weeds, and the surface clean, occasionally stirring between the rows of plants. *Pansies.*—It is rather late for planting out, but where plants have good roots this may still be done. Continue to collect leaves as they fall, laying them up for future use. Allow your compost heaps to remain untouched whilst so wet; in fact, now that the soil is so saturated, the less that is done the better.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Pine plants, the fruit of which has recently appeared, must be encouraged with heat and moderate moisture; but those that are likely to "show," between this time and the beginning of January, should have a temperature that will just keep them advancing slowly till the end of January, so that they may be swelling their fruit when the days are lengthening. Fruit not ripened in the dead of winter would be small, will by this means attain a tolerable size. Look [illegible] to the state of temperature of trees recently renewed with fresh, lest they become suddenly too hot.

Vineries.—The time will soon arrive when many will begin to force their first vinery. We have here, at this time, a striking proof of the advantage of bottom-heat in the early forcing of Vines. A vinery which was started in September, contains some Vines planted inside and trained up the back of the house, and others planted in the outside border, and trained up the rafters. The outside border is concreted over and covered with stable litter, which is renewed and stirred up occasionally so as to maintain a gentle heat in the soil; while to the roots of those planted inside the house, there is no means of imparting heat in heat. The result is, that the Vines in front are now coming into bloom, even better than they did in January last, while on those at the back, the buds have scarcely broken yet. To prevent rain entering the Vine borders, I had a layer of concrete 1½ inch thick formed of quick lime and clean gravel, in the proportion of one bushel of lime to eight of gravel, to answer well; and with us it costs less than any other plan I have tried. The gravel and lime is mixed with water to the consistency of mortar, and immediately spread over the border, and well smoothed with the back of a spade. It soon sets and becomes impervious to wet. It should when dry be well covered with litter, to keep the frost from it. About the end of May it may be removed, to let the air and rain to the border. If during the forcing of the Vines the border is covered with warm litter, the roots will come up and cling like network to the under surface of the concrete. In removing it, therefore, care must be taken not to injure these, and a top-dressing of rich leafy soil will be found of much benefit to the Vines.

Cherry-house.—Let the plants in pots be looked over, and if they require shifting into larger pots let it now be done. Plunge them afterwards in some loose material to keep the roots from frost, and they will commence rooting directly. Trees in pots that do not require shifting.

Fig-house.—Figs in pots should now be shifted, or top-dressed, as may seem necessary. Top-dressing is preferable to shifting, except it is desirable to increase the size of the plants. Place them afterwards in a shed, with the pots plunged in leaves.

Strawberries.—Where the quantity in pots is great, and cannot conveniently be disposed of during the winter, otherwise

than by plunging them in a south border, it is desirable to hoop them in such a manner as to support some kind of a mat or canvas covering that will throw off heavy rains. The rain, if they are exposed to it, will wash the greater part of the nourishment out of the soil; and if sharp frost quickly succeed rain, I always find a great many pots broken by it. With me the Strawberry plants do best when treated in the manner described at page 703; the reason obviously being that the soil is neither washed by rain, injured by worms, nor so liable to contract and leave a vacant space round the sides of the pot, to the great injury of the roots when brought in to force, as it is, after having been exposed to the rains of the early part of the winter.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Fruit-room.—The present changeable weather will furnish an opportunity of examining and removing all decaying fruit. Those slightly specked should be taken out of the fruit-room, and reserved for present kitchen use, as otherwise the atmosphere of the room would become so tainted, as to hasten the decomposition of all the stock. Most gardeners are perfectly aware of the importance of a close atmosphere, and an equable, rather low temperature, for the long preservation of Apples and Pears. Where, therefore, the fruit-room *must* still be used as a general receptacle, and where consequently air will frequently be admitted, the fruit may be covered with clean Wheat-straw, which will have a tendency to keep it in a uniform temperature, and prevent it shrivelling by perspiration. This is more necessary to be attended to this season, as many of our best fruit are fit for table much earlier than usual The best keeping Apples and Pears may be packed in jars, or new garden-pots, covering each layer with dry sand, if silver sand, such as is used for propagating, so much the better. Chaff should scarcely ever be used for such a purpose, as however well dried, the moisture from the fruit is apt to make it ferment, so as to vitiate the flavour. *Chesnuts*, *Walnuts*, and *Filberts*, are clearer in the shells, and fresher and moister in the kernels, when packed in sand than by any other method I have tried. *Walnuts*, if previously well dried in the sun, may be kept in a heap covered with straw, provided they be turned frequently; but the kernel is more shrivelled, and the inner pellicle is more adhesive to it than when the fruit is packed in sand. The boxes or pots in which it is packed in sand should not be over large. If kept on shelves, or in heaps, unless in a very dry place, the outside shell soon contracts a mouldiness, which will soon find its way to the inside if not removed. A quick method of effecting this, is to put a quantity in a clean sack, and move them backwards and forwards quickly by two men, each holding the two corners of the ends of the bag.

Root-house.—Remove all decaying and damaged Carrots, &c. Prepare suitable places for a supply of Turnips, Celery, &c. being stored up on the first approach of severe weather. Potatoes if kept in a house, and especially if raised in rather a wet state, should have flues formed of faggots, &c. passing through the heaps. When sufficiently dried, the draught of air may be stopped or regulated at will. When the flavour of newly-raised Potatoes is preferred to having them like a ball of flour, a quantity of earth neither dry nor wet may be sprinkled amongst them. With a little attention to minutiæ, these roots may be kept as well in a house as by any other method, and any labour they require in spring and summer, can be performed in unfavourable weather. When one sees the large heaps of Potatoes, piled inconsiderately together, and thinks of the heating and fermentation produced, it is not surprising that their flavour should be deteriorated, and that when such tubers are planted, after an exhausting of their vital energies, they either should not grow at all, or present a sickly vegetation.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Attend to directions given in late Calendars.

Coppice.—In filling up vacant spaces in old, or in planting new ones, I would recommend the common Bird-cherry, or Hagberry, as a valuable addition, on account of its quick growth when young; it is useful for the same purposes as the Hazel, and thrives luxuriantly in moist ground.

Young Plantations.—Forward with all expedition any planting that is intended to be done before spring. As hares and rabbits begin their depredations upon young plants and trees, long before severe weather sets in; the sooner they are protected from them the better—a week's delay may cause much injury. I know of nothing of more easy application, or less unsightly, than a mixture composed of fresh night-soil, (cloacine), cow-dung, soot, or ashes; this applied to the stems, in the form of thick paint, will preserve them perfectly secure from injury.

Hedge-rows.—Continue the works recommended to be done in previous Calendars. The Worcester and English Elms, with the Poplar and the Walnut, are trees suitable for hedge-rows in some localities.

Nursery Work.—Refer to last Calendar.—*W. B.*

VII.—COTTAGERS' GARDENS.

Such of the cottagers as have a favourable situation against the wall of the cottage, or elsewhere—a south aspect, or one inclining to south, being preferable—and are desirous of having a Peach, Nectarine, or Apricot-tree, may plant of Peaches, the Royal George, or the Bellegarde; of Nectarines, the Elruge, or the Violette Hâtive; and of Apricots, the Moorpark for dessert, and the Breda for preserving. Apricots bear well in some situations planted against the cottage wall, and in favourable seasons some cottagers make a handsome trifle of Peaches and Nectarines, where the trees have a good border, and are well attended to. In forming a border, clear out the soil to the depth of about 18 inches at the wall, giving the bottom a gentle slope towards the front, where there should be a drain, for the purpose of speedily carrying off all superfluous water. Cover the bottom of the border with concrete, or anything that will prevent the roots from getting down into bad soil, and then fill up with fresh turfy loam from the surface of an old pasture, if that can be procured. Where it cannot be avoided, as is frequently the case, the border may be all paved over, with the exception of a small space round the neck of the tree, and used as a walk. In some of the best gardens, Apricots may be seen growing in borders made in this manner; and I have seen them on cottage walls, with their roots in a similar situation, bearing abundance of good fruit, even in spite of bad management as regards pruning, &c. Let all vegetable refuse be cleared away to the manure heap, which should be occasionally turned, and covered in with soil. Everything that can be made available for manure should be added to it; for, as I have before stated, upon its accumulation the crops for next year greatly depend. Rough-dig any vacant ground, exposing as large a surface to the action of the weather as possible. Clear up around the cottage, and put everything in order for the winter.—*J. MeH.*

State of the Weather near London for the week ending Nov. 7, 1844, as observed at the Horticultural Garden, Chiswick.

Nov.		Moon's Age.	Barometer. Max	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 12th 1841—therm. 63°; and the lowest on the 16th, 1841—therm. 15°.

Notices to Correspondents.

Some of our Correspondents have begun to favour us with long lists of plants, concerning which they desire to know every particular, as to country, size, colour, time of flowering, and cultivation. To answer such questions would be to write treatises, or to republish pages of catalogues. We must, therefore, beg them to excuse our non-compliance with their desires. Paxton's "Botanical Dictionary," or similar works, will give them the greater part of the information they seek, and to such sources of information we must take the liberty of referring them.

Books.—*P*—The Cacti are described in Pfeiffer's "Monographia Cactearum;" the Aloes, in the 4th volume of Kunth's "Enumeratio Plantarum."——*A Constant Reader.*—Apply to Mrs. Loudon, from whom the Numbers you want may be had.‡

Chinese Quince.—*Dodman.*—This has been fruited in this country, but it requires a wall. The fruit is very different from that of either the Common or Portugal Quinces; it is cylindrical, about 6 inches in length, and exceedingly gritty. We are not aware of any attempts having been made to hybridise the Quince and Pear.‖

Chatsworth.—*J. M.*—There is no doubt about the weight of the masses of rockwork used at Chatsworth; they are of sandstone, and were removed in a very simple way, viz. by lamination.

Chrysanthemums.—*C. P.* says, that all his Chrysanthemums in the *second* year always come pink. He had new varieties again last year, some of which were yellow, some white, and some pink, and they are all this year come pink, as they did before; the soil, which was made new this last spring for them, is composed of leaf mould two years old, rotten stable manure, and some rather clayish soil. We can offer no explanation of this supposed fact; but should fear that a change has been made among the plants themselves, rather than their blossoms.

Endive.—*Dodman.*—The variety you have seen in Belgium is most probably the Corne de Cerf. ‖

Fruit-trees for Espaliers.—*C. B.*—Apples: Golden Reinette, Blenheim Pippin, Claygate Pearmain, Ribston Pippin, Old Nonpareil, Herefordshire Pearmain, Court of Wick, Dutch Mignonne, Court Pendu-plat, Scarlet Nonpareil. Pears: Beurré Bosc, Marie Louise, Glout Morceau, Hacon's Incomparable, Passe Colmar, Easter Beurré, Beurré Rance, Thompson's, Winter Nelis, Suffolk Thorn, Knight's Monarch ‖

Fuchsias.—*A. X.*—Cutting down the Fuchsia Corymbiflora will make it as bushy as its nature will permit, and not prevent its flowering next year; but it should never be grown as a bush. It ought always to be trained with a stem 7 or 8 feet high, and an umbrella head.

Gesnera zebrina.—*A Subscriber.*—It is probable that some insects have eaten the round holes in the leaves of your plant, although you cannot detect them. It should be potted in rough heath-mould, mixed with about one-fourth of silver sand. The pot in which it is grown should be well drained. It is a stove plant, and requires a humid atmosphere.§——*A Constant Reader.*—Your (Gloxinia) Gesnera zebrina evidently requires more heat. The temperature should never be below 60° at night when the plant is coming into bloom. This plant will succeed best where bottom heat can be applied.§

Grapes.—*J. B.*—The Black Lombardy is the same as West's St. Peter's (not Oldaker's); bunches rather large, but not long; berries, large, roundish, black, thin-skinned, rich: a moderate bearer.‖

Heating.—*X. Y. Z.*—We quite agree with you as to the trouble, dirt, and inconvenience of growing Melons and Cucumbers with dung. Your plan of heating a series of pits with hot water seems so good that we will publish it as soon as a cut can be made. A paper on Tank-heating appears in another column, which you will do well to consult.

Insects.—*X. X.*—Should you have any opportunity of detecting the insect which bores into your standard Roses, and will forward specimens to Mr. Curtis, he will give you the information required. *R.*——*S. T.*—Your Oak-leaves are covered with the Oak-spangle, which is produced by a minute Cynips. You will find their history in the *Gardeners' Chronicle*, vol. iii. p. 52. *R.*——*J. S—h.*—Your Vine-leaf insects are the larvæ of a Thrips. *R.*——*Nux.*—We must refer you to vol. ii. p. 108, for the history of the Filbert Beetle, which will enable you to judge what is best to be done. Burning the leaves and rubbish under the trees, and forking in lime, would perhaps be useful. *R.*——*P.**—We can only recommend you to persevere with the washing, for one infested plant may inoculate all the others in time. We think the gummy exudation cannot arise from the insects, as you say the Lemon-plant is now free from the Coccus. *R.*

Ipomœa Horsfalliæ.—*Devoniensis.*—Cut your plant well back, and wash it with soap-suds and sulphur. It would be advisable to let it remain dormant until spring; then by syringing it morning and evening, when it begins to grow, the red-spider may be kept in check.§

Leschenaultia formosa.—*A Subscriber.*—This plant should be grown in a warm greenhouse. Such soil as Heaths are generally grown in is suitable for it.§

Mildew.—*Dendron.*—Doubtless it is cold and damp together that have mildewed your Dendrobium nobile. All the Dendrobia like warmth, and 54 is too low for them. The total obstruction of sunlight has increased the mischief.

Names of Fruits.—*S. T. H.*—1, Hawthornden; 2, Golden Reinette; 3, Fearn's Pippin; 4, Pennington's Seedling; 6, Adams's Pearmain; 7, New Golden Pippin; 8, Dutch Mignonne; 9, Scarlet Crofton.‖——*E. I.*—1, Cornish Gilliflower; 5, Powell's Russet. 1, Colmar; 2, Passe Colmar; 3, Glout Morceau; 4, Rousselet.‖——*Este.*—The Seedling Apple, No. 1, proves not rich enough to merit recommendation. 2, Doyenné Gris; 3, Colmar; 5, not 3, Glout Morceau. ——*Z. Z.*—1, 2, Doyenné Blanc; 3, Forelle; 4, Brown Beurré; 5, Winter Bon Chrétien; 7. St. Germain.‖——*A Constant Reader.*—1, Fearn's Pippin; 2, Cluster Golden Pippin; 3, Brown Beurré; 4, Messire Jean; 5, Gansel's Bergamot; 6, Doyenné Blanc; 7, Crassane; 8, Moor-fowl Egg; 9, Passe Colmar; 10, Beurré Rance; 11, St. Germain; 12, Easter Bergamot; 13, Catillac.‖——*J. S.*—1, Golden Russet; 2, Easter Pippin or French Crab; 3, West Grinstead Pippin; 5, Wormsley Pippin; 6, Royal Russet. The Pear is the Catillac.‖——*A Subscriber.*—1, False Delices d'Hardenpont; 2, Black Achau; 4, Hacon's Incomparable; 5, Bellissime d'Hiver; 6, Colmar; 7, Flemish Beauty; 8, Double de Guerre; 9, Aston Town. 1, 2, Golden Reinette; 2, Cockle Pippin; 3, Blenheim Pippin; 4, Cluster Golden Pippin; 5, Waltham Abbey Seedling; 6, Beauty of Kent; 7, Newbold's Duke of York; 9, Hollandbury; 10, Crimson Queening; 11, Hughes's Golden Pippin; 12, Rymer; 16, Easter Pippin; 17, Hawthornden; 18, Scarlet Crofton; 20, Alfriston.‖——*Tolla.*—Particular attention has been paid to your Apples No. 1 and No. 2; they are the same variety, but not the true old Golden Pippin. The flesh of the latter is richer and more yellow; and it has specks in the skin, which the specimens sent have not.‖——*J. S.*—There being no leaves sent along with your Pine-apple, it is impossible to say whether it is an Enville or one of the seedlings belonging to the Enville tribe.§——*S.S.*—Glout Morceau.‖——*D.*—Your Grape was beginning to decay; it is probably the Lombardy.‖

Names of Plants.—*B. M.*—1, Some Anoda, apparently; 2, Aristolochia glauca.——*C. Moore.*—The parasite is Uredo filicum. It is very common in Cystopteris fragilis, and sometimes so abundant as to injure the plant. These parasites occur frequently under such different circumstances, that it will probably never be known exactly what favours their growth. *M. J. B.*——*Agatha.*—1, A Bignonia, perhaps æquinoctialis; 2, an Erythrina; 3, Jatropha multifida; 5, Hedychium coronarium; and 6, a Bauhinia. §——*An Original Subscriber.*—Hymenophyllum Wilsoni in blotting paper. The Oaks are varieties of Quercus sessiliflora.——*E. H.*—Comanthus fimbriatus is Phacelia fimbriata, and belongs to Hydrophyllaceæ. Begonia manicata, *Cels.*; acida, *Vellozo*; Statice pseudo-armeria, *Jacquin*; Ceanothus thyrsiflorus, *Escholtz*; Cereus crenatus, *Lindl.*; Gongora truncata, *Lindl.*; Habrothamnus cyaneus, *Lindl.*——*South Lambeth.*—1, Opuntia cylindrica; 2, Crassula bimaculata; 3, Sempervivum arboreum; 4, Aloe serra; 5, Mesembryanthemum echinatum; 6, M. inclaudens; 7, M. uncinatum; 9, M. caulescens; 10, M. diversifolium; 11, M. dilatatum; and 12, Aloe distans. §——*Flora, Forfarshire.*—1 and 4, Calluna vulgaris; 2, Erica mediterranea, var. alba; 3, Calluna vulgaris, var. tomentosa; 5, Erica mediterranea; 6, Leptospermum juniperinum; 7, dried up; 8, Andromeda polifolia and Eupatorium cannabinum. §—— *W. G.*—Quercus pedunculata. ¶——*T. R.*—1, Zygopetalum Mackaii; 2, Maxillaria picta. By pouring sulphuric acid over lime you will certainly form gypsum; and you will know when the power of the acid is exhausted by the lime, which is no doubt a carbonate, ceasing to effervesce. If you try the experiment, you had better dilute the acid a good deal with water. But you will find sulphuric acid *per se* a better disinfecting agent, and sulphate of iron cheaper and better than either.——*W. W. W.*—Dead flowers should not be sent for examination. Perhaps a Eupatorium.

Peach-trees.—*An Original Subscriber.*—Your border has been well made, and in growing three years to wood only, your trees have done well likewise, seeing they have only been so long planted. Train so that there be but one upright shoot in the whole tree; let that be in the centre, and annually cut back to furnish other branches, and a fresh upright. ‖

Pears.—*A Subscriber.*—For standards in the north of Lincolnshire: Aston Town, Marie Louise, Louise, Bonne (of Jersey), Belmont, Flemish Beauty, Comte de Lamy, Thompson's, Figue de Naples, Hacon's Incomparable, Knight's Monarch, Winter Nelis, Glout Morceau, Althorp Crassane, Fondante d'Automne, Suffolk Thorn, Ne Plus Meuris. Most of these will doubtless succeed; all are worthy of trial, and if any prove unsuitable, it is an easy matter to graft them with such varieties as may be found to answer.‖——*Querist.*—The Winter Bon Chrétien will not succeed on a N.N.W. aspect; better substitute Hacon's Incomparable. On the E.N.E. aspect you may plant Winter Nelis, Suffolk Thorn, Ne Plus Meuris, Hacon's Incomparable, and Jargonelle. These aspects will suit Morello and Kentish Cherries, and the Orleans Plum. ‖

Pear-trees.—*Delta.*—Head down next month your trees intended to be grafted the following spring. Intending to form wall or espalier-trees by grafting standards, you ought to head the latter back to within 15 inches of the ground, and a little lower by a fresh section at the time of grafting. Bending down branches will induce fruitfulness. Glout Morceau and Marie Louise for your N.W. aspect. ‖

Passion Flowers.—*Q. W. L.*—We never heard of such a thing as preserving Passiflora edulis in sugar for the dessert, and doubt the possibility of it. Its shell is too hard, and its pulp too watery. It is always eaten fresh and ripe, or used for ices, in which way it is said to have been in favour with King George the Fourth.

Sand.—*An Amateur.*—Silver sand is the purest form of silica that can be readily obtained. We are not aware whether it is procured in Yorkshire. It is considered better for horticultural purposes than well-washed sea or pit sand, or that from beds of rivers; but the latter will do very well if they are thoroughly washed.

Tussac Grass.—*W. B. B.*—You cannot confound Carex trifida with Festuca flabellata. The former is a solid-stemmed sedge; the latter a hollow-strawed Grass. Besides, the fruit of Carex is the hollow flask-like case peculiar to that genus; the other has seed very like Cock's-foot Grass on a large scale.

Violets.—*W. G.*—The Violet is not new, but is seldom cultivated, on account of its being semi-double, and of a dull colour.¶

Miscellaneous.—*A Constant Reader.*—Your gold and silver fish will succeed well in a plant stove.§——*Malum.*—Ferns are excellent material with which to protect plants in winter. They are preferable to Moss. Since you can get them, cover up your Fuchsia globosa with them, taking care at the same time to put a good layer over the roots—the most material part to protect—and it will probably survive the winter without injury ‡——*Δινταν.*—None of the plants you have named are sufficiently handsome to be worth growing.‡——*Carbon.*—To pour water upon a quantity of charcoal, and allow it to remain for some time, and then use it for watering plants, would not be attended with any benefit.‡——*A Subscriber.*—The only way by which you can clear your lawn from Sorrel at less expense than relaying it, is to persevere in destroying the foliage as soon as it makes its appearance. It is a tedious operation, but will ultimately, without fail, have the effect of killing the roots.‡——*Ruricola.*—One of the Grapes you mentioned is as good as the other for a greenhouse.——*J. P. C.*—Throw half a pound of corrosive sublimate into a jar of water; let it stand an hour or two; then stir it up and leave it for a day. To the solution thus obtained add 10 times its bulk of water. Keep the undissolved sublimate for future use; half a pound will last for a long time. ——*An Admirer of Consistency.*—Nothing degrades the newspaper press more than personal altercations between their editors. They are in very bad taste, to say the least of them, and are pieces of impertinence towards readers, who buy newspapers for something more valuable than egotistical rhapsodies by the nobodies who can find nothing better to talk of than themselves.——*A Constant Reader.*—We do not remember having seen a fruit of Gardenia Rothmannia ripened in this country. We have no means of judging whether it has been artificially fertilised or not.——We regret the necessity of referring an *Old Subscriber* to the first paragraph in these Notices to Correspondents.——*Pluto.*—In all probability your plants have suffered from cold; we however know no such plant as Clerodendron maculatum.——*A Subscriber.*—They require no protection.

SEEDLING FLOWERS.

Fuchsias.—*A. Z.*—A large flower, with flesh-coloured tube and sepals, and rosy-purple corolla; this seedling is not equal to many of the same character which we have seen during the season; the sepals are too long, and the corolla too pale and small, for the size of the flower.*

Petunias.—*Rex.*—Both your specimens are well-formed flowers, but they are not equal to many varieties which have appeared during the present season; the large variety is the better of the two, but this wants purity in the ground colour.*

**As usual many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

AGRICULTURAL COLLEGE.—At a Meeting of the Committee of Management, held the 1st instant, it was resolved:—"That the Head Master not being yet fixed on, applications to fill that office shall be received until the 30th inst. He must have a knowledge of Agriculture and of the sciences connected therewith. The salary to be 200*l.* per annum; and 1*l.* per annum additional, for every pupil above the number of 50. The master to be allowed the board of the College for himself and wife, and a furnished dwelling in or attached thereto. A married man will be preferred; and if, with the approval of the Committee, his wife take charge of the housekeeping, 50*l.* per annum will be added to the salary. The master to have the superintendence and control of the whole establishment, subject to the Committee alone: to give his whole time and to take part in the Farming, Teaching, or otherwise, as circumstances may require." Applications and testimonials to be sent to ROBT. J. BROWN, Hon. Sec. Cirencester, Nov. 2, 1844.

NOW READY FOR DELIVERY,

JOHNSON AND SHAW'S FARMERS' ALMANAC AND CALENDAR, for 1845, 220 pages, and 100 Engravings of the best Agricultural Implements, with their prices and Makers' names, &c., &c. Price only 1*s.*; also,

1. JOHNSON'S TRACTS for Agricultural Schools, Cottage Farmers' Assistant, Farmers' Calendar, and Agricultural Chemistry, 1*s.* each.
2. A New and enlarged edition of JOHNSON ON MANURES, price 16*s.*
3. VON THAN'S PRINCIPLES OF AGRICULTURE. Translated by C. W. JOHNSON, Esq., F.R.S., and W. SHAW, Esq., in 2 vols., price 25*s.*, cloth.
4. MORTON ON SOILS. A New edition, enlarged, price 10*s.*
5. SQUAREY'S AGRICULTURAL CHEMISTRY for the Practical Farmer, 5*s.*
6. SINCLAIR ON GRASSES AND WEEDS OF AGRICULTURE, 45 coloured plates, 30*s.*

WE continue our remarks on the practice of CHALKING LAND. In parts of Hertfordshire a heavy dressing of chalk raised upon the spot by means of shafts sunk through the soil, is spread at intervals of 14 or 20 years over the argillaceous portions of the London clay, and over the sandy and gravelly soils, occasionally covering the lower beds of that formation. The drift constitutes the surface soil over a considerable tract, which skirts the base of the chalk hills, and is laid down in some of our geological maps as chalk, in others, as a member of the London clay. Its depth varies greatly and rapidly, being even in the same field less than 3 feet and more than 10. In brickfields near St. Alban's its depth varies between 6 feet and more than 20, and a rill less than a quarter of a mile from these pits has cut through the drift to the depth of 30 or 40 feet, without exposing either chalk or any beds of the London clay.

Analyses of the chalk of different localities, and of the same locality at different depths, are among the data wanted to place the improvement of land by means of chalk upon a rational and scientific basis. The geologist recognises in the white chalk upper, middle, and lower beds, differing in the abundance in which flints and organic remains are present, differing in their mineralogical aspect, and, of course, in their chemical composition. The chalk of one locality Mr. Lonsdale found to be composed almost entirely of organic bodies—microscopic shells and fragments of corals. In that of Brighton nearly 1 per cent. phosphoric acid has been detected. Do any portions of the chalk of other districts contain more of that valuable substance? Do all contain as much? Differents beds of chalk contain different proportions of alumina, mixed with the calcareous matter which constitutes the greater part of their bulk. For the improvement of sand or gravel we should expect that chalk to be the most efficacious which contained the greatest proportion of argillaceous earth; while, for the improvement of clayey soils, chalk possessing the opposite qualities would appear to be preferable. The farmers of Suffolk prefer the chalk brought from Kent to that which lies under their own fields. Does this arise from difference of composition, or from the cheaper rate at which the Kentish chalk can be supplied, by reason of the large scale on which the pits are worked there, and the depth of covering over the chalk in that part of Suffolk where it is used? These are important questions, which can only be solved by a rigorous chemical analysis of the chalk of different localities. But who is to undertake this important though expensive work? It is a work in which, in our opinion, a portion of the funds of Agricultural Associations might be profitably spent.

We have made arrangements for laying before our readers details of the practice of chalking land in those districts where it is most prevalent; and Mr. Gyde, of Painswick, has undertaken the analysis of a series of specimens of chalk from different portions of that formation, with which Mr. Trimmer will supply us. The results of these analyses will appear in our columns.

We shall conclude the present Article with a few practical details of the Hertfordshire mode of chalking, obtained from some workmen whom we found engaged in the process. The field on which they were employed was a Wheat stubble, in course for a Turnip fallow; the adjoining field, a Clover ley, had just been chalked for Wheat. They were situated in the parish of Ridge, at the foot of the hill of the same name; the soil was a gravel, with a light loamy base, belonging to the drift formation. Its depth, as exhibited in one of the two pits which were open, was about three feet; in the other nearly ten.

The chalk was raised by means of a common windlass, in a bucket holding a bushel. Twenty-two of these are called a "yard" or a "load." How many loads they were spreading to an acre the workmen did not know; some farmers, they said, laid on 100 loads, some less. From the thickness of the covering, we should consider full 100 loads to have been used in this case. After the work is finished, the excavation is filled up by throwing in the soil and chalk from round the mouth of the pit, thus producing a slight hollow in the field. There was in this case a contractor for the whole job, between the farmer and the workmen. The men stated the price received by them from the contractor to be 6*d.* per load of 22 bushels for raising the chalk, carrying it over the land, and spreading it. The cost of the operation, at this rate, supposing the largest quantity above-named to be used, would not exceed 50*s.* per acre, and the benefit of it would be felt more than 14 years. It was stated by one of the workmen that his grandfather had been accustomed to receive 1*s.* per load where they had 6*d.* At the latter price they said they could earn, by a hard day's work 10*s.* or 11*s.* a week. It is usual to sink pits at such distances that the chalk can be wheeled from them over the field; but in this case, the covering being deep on one side of the field, and the farmer being unwilling to disfigure the surface by more of the hollows which remain after filling in the pits than were absolutely necessary, allowed the use of a horse to draw the chalk to those parts which were beyond wheeling distance.

We have no doubt this account will draw forth further particulars from some of our readers resident in the district. The amount of alumina and phosphate of lime applied to this field in a dressing of 2200 bushels of chalk we hope to be able to announce before long.—*E. W.*

CULTIVATION OF WHEAT ON THE SAME LAND IN SUCCESSIVE YEARS.

IN Oct., 1843, you published an account of an attempt of mine to grow Wheat on the same land year after year. As the subject appears to me to be an important one, and as many persons who may read this letter may either not have seen the former, or may have forgotten it, a short summary of the former experiments may not be out of place.

These experiments were commenced in the autumn of 1841, after the field had been cleared of a crop of Oats, which was a very bad one; the land being not only naturally poor, but foul, and exhausted by long cropping. As the season was very wet, it was indifferently cleaned, and *one-fourth* of it manured with a compost of night-soil and ashes, and then the field was sowed with Wheat. Two of the remaining three-fourths were manured on the 6th of May, 1842 (the spring being a very dry one, no rain came until that day), one with guano, the other with nitrate of soda, each at the rate of 2 cwt. to the statute acre; and the remaining fourth was left unmanured. The following were the results at harvest:—

	Bushels (of 60 lbs.) per acre.
That manured with night soil and ashes produced	32
" " guano	27
" " nitrate of soda	27
Unmanured	19⅔

When the field had been cleared of the crop, it was immediately ploughed up; and, as the season was favourable, the land was well cleaned, and sowed with Wheat in October, 1842, without any manure, except 1 cwt. of guano, which was scattered over it when the Wheat was coming up. The field was divided into three portions; and in April, 1843, was manured as follows:—No. 1, with 90 lbs. of sulphate of magnesia, and 2 cwt. nitrate of soda to the statute acre; No. 2, with a compound from a manufacturer of chemical manures; No. 3, with 60 lbs. of silicate of soda, and 2 cwt. of nitrate of soda to the acre; and, with the view of still further varying the experiment, a part of each portion was sowed with guano a fortnight after the application of the chemical manures. The crop promised to be a very good one, but it was much plundered by the birds; and, as the summer was wet, it suffered also much from rust. Allowing for the destruction occasioned by the birds, the crop per acre was estimated at—

41⅔ bushels in patch No. 1;
36 bushels in patch No. 2;
41⅓ bushels in patch No. 3;

and, in that part of No. 3 which was also covered with guano, it reached by actual weight (not by estimate) 53⅓ bushels of 60 lbs. to the acre. Those patches in Nos. 1 and 2, which had guano put on them, suffered so much from the depredations of the birds, that no account was taken of them separately.

The crop was cleared off the land, which was cleaned, and again sowed with Wheat on the 31 October, 1843. It was drilled in rows, seven inches apart, and at the rate of 2½ bushels to the acre. It is to the results of this crop that I now wish to call your attention.

Before sowing, the land was sub-soiled to the depth of from 14 to 16 inches, except a strip of about 10 feet in width down the middle of the field, which was left untouched for the purpose of determining what were the advantages derived from subsoiling. If the advantage was merely that of thorough-draining (for the field had not been thoroughly drained previous to the subsoiling), it was thought probable that this strip of 10 feet wide would be drained by the subsoiling on each side of it; but if, in addition to this, the Wheat plant derived more nourishment by striking its roots deeper into the soil, where that was loosened by the subsoil plough, the crop ought to be better in the subsoiled than in the unsubsoiled part. The field runs over the ridge of a hill; and upon that ridge the soil is so poor and thin, that it was deemed expedient to give it a slight dressing of coal ashes and night-soil, from an idea that the plant would scarcely survive the winter unless some stimulus were applied there; but the ashes contained little manure, and were only applied to the worst part of the field, covering about one-third of its surface. The Wheat was Spalding's Prolific: it came up evenly and well all over the field. It was hand-sowed with lime early in February, to the extent of about 21 cwt. of dry lime on the acre.

In order to ascertain the value of lime, and the proper quantity, I had the field uniformly covered with it, except one land, which was left entirely without it, and the headlands, which had, one three, the other six times as much lime put upon them as any other part. The field was also dressed with a chemical manure, of the following ingredients, on the 16th March, costing—

	s.	*d.*
1¼ cwt. nitrate of soda	17	6
1 cwt. impure sulphate of magnesia	5	0
¾ cwt. silicate of soda	11	3
¾ cwt. common salt	2	0
1¼ cwt. gypsum	2	0
Mixing and applying it, say	2	3
Total per statute acre	40	0

Speculating on the probability of a dry summer, I gave it an extra quantity of manure; and think that where guano is used afterwards, as it was by me, the nitrate of soda might be dispensed with, which would bring the cost to 22*s.* 6*d.* per acre. I should prefer guano to nitrate of soda, because of the phosphates contained in the former. At the distance we are from the sea (about 30 miles), it would seldom be necessary to apply common salt, as the gales of winter generally bring as much as is needed; but last winter we had no high winds, and I thought that, where salt was applied along with the other chemical manures, the Wheat was more luxuriant than where there was none; but owing to a misunderstanding of the instructions to that effect, the produce was not kept separate.

When the chemical manure was applied, one land was left without it, for the purpose of comparison. Guano was sowed on the land on the 29th March, at the rate of something less than 2 cwt. to the statute acre; one side of the field being covered with Peruvian, the other with African; and the land on which no chemical manure had been sowed was, half of it covered with guano, and the other half left without anything except lime; but as it was thought desirable to ascertain the value of the chemical manure, without guano, half of this patch was sowed with the chemical manure in April, after the long drought of the last spring had thoroughly set in. A small patch was left without manure, to show the natural condition of the field, and to serve as a comparison both with the manured part alongside of it, and also with the condition of the field when the experiment commenced, in 1841-2, when the unmanured portion yielded only 19⅔ bushels per acre. This part of the experiment, however, was frustrated by the carelessness of the men who threshed out the Wheat.

The crop was a very good one throughout the field, but was evidently shorter and thinner where there was no lime, and also where guano was applied alone. It was best on the headlands, where more lime had been applied.

The weather was exceedingly favourable until the Wheat was going out of bloom; but it then changed, and the crop was beaten down by the rain, in some places so thoroughly that it never rose again; and from that time to the day it was reaped (the 21st August) there were not more than six fine warm days. This cold and ungenial weather would, no doubt, materially affect both the quantity and the quality of the crop, the sample being only just fair.

On threshing out the crop, I find the result to be as follows:—Where the guano and chemical manure were applied, but no lime, the yield was 49⅓ bushels (of 60 lbs.) per statute acre; where the land was left unsubsoiled, it was 52½ bushels; where guano alone was applied, it was 42⅓ bushels; where the chemical manure alone was applied, it was 43½ bushels; where the African guano was applied, it was 45 bushels; where the Peruvian was applied, it was 52⅔ bushels; on the headlands, where three times the quantity of lime (or 3½ tons per acre) was applied, it was nearly 62 bushels; and where six times the quantity of lime (or 7 tons to the acre) it was 49⅔ bushels. I give this last result as it was ascertained, but do not consider it conclusive, for the

Wheat-plant on this headland looked quite as well as the other, until it went out of bloom, when from some unknown cause, it was partially blighted,—an irregular patch, from a foot to a yard in width, and extending almost from end to end of the headland, becoming brown and parched, as if affected by lightning, or some atmospheric visitation. With the view of making these results a little clearer to the eye, I subjoin the following tabular statement of the produce per acre, in the different parts of the field:—

	Bushels of Oats per statute acre.
Guano alone	43½
Chemical manure alone	44½
Guano and chemical manure, with 24 cwt. of lime to the acre, but land unsubsoiled	57½
Do. do. but no lime	49 1-5th
African do. do. and lime	45
Peruvian do. do. do.	53½
Do. do. do. 3 times as much lime	62
Do. do. do. 6 times as much lime	46½
Average crop throughout the field	50

It may be as well to observe, that the total expense of manure, and of its application, to that portion of the field which produced 62 bushels per acre (including the guano and the additional quantity of lime used), was at the rate of 81*s.* per statute acre. Deducting the cost of the nitrate of soda, the utility of which, under the circumstances, I am inclined to doubt, it would have been 63*s.* 6*d.*

I consider these to be very favourable results, and as offering strong inducements to continue the experiment. I have accordingly had the land ploughed up and cleaned, and it was again sowed with Wheat on the 9th instant.—*T. J. Clitherow.*

(*To be continued.*)

ON FLAX SEED AS FOOD.

To many of the readers of the *Agricultural Gazette* an apology may be necessary for bringing this subject so frequently under their notice; they may not be impressed with a clear idea of its importance to the farmer. In a recent paper in one of the numerous agricultural publications of the day, while advocating the advantages of another addition to the list of cultivated plants in Britain, the writer appears to entertain such very extraordinary notions regarding Flax culture, and the application of the seed as food for live stock, that he hopes "the advocates of the one and the other are now so sensible of their folly that they will hide their heads with shame, and not encounter the indignant condemnation of their countrymen, on whom they have so shamefully imposed." This is strong language; so strong, indeed, that it is quite apparent it proceeds both from gross ignorance and unconquerable prejudice. It is, in fact, language which those whose sole efforts are devoted to the extension of useful knowledge among any class of their fellow-creatures should be ashamed to employ.

In already advocating the extension of Flax culture in the pages of this Journal, I was particularly anxious to guard its readers against entertaining over-sanguine expectations as to the results thereby to be obtained. I said, that the Flax crop was unprofitable or profitable according to the management adopted, and that such management, to be successful, requires a greater degree of particularity in the performance of the several processes connected with it than is necessary in the case of almost any of the other cultivated crops. On these grounds, then, it was especially recommended that such farmers as had not previously some opportunity of acquiring a practical knowledge of the mode of proceeding adopted in the Flax-growing districts, should be cautious in their first attempts to grow the article, and that their operations should in the first instance be conducted only on a small scale, until they ascertained how far they were likely to be successful. In regard to the use of Flax-seed as food, such precautions were scarcely necessary, as the quantity of this substance used in a particular form by British farmers, from an early period, has been very great. Oil-cake has always been in high and deserved repute as food for the domestic animals of the farm, and therefore it was no great innovation of established practice to recommend the use of the genuine seed itself. Most farmers are aware of the extent to which adulteration has been practised in the case of the portable manures, and there are abundant grounds for stating that a similar system has prevailed in the case of oil-cake, which, being a more valuable substance, held out greater inducements for the adoption of such a course. This imposition, however, can be guarded against by using the seed itself instead of the cake prepared from it, and in the former article it is apparent that no adulteration can take place which the most simple examination will not be sufficient to detect. In the estimation of the nutritious ingredients respectively contained in the Flax-seed itself and in the cake, the proportion usually existing in the former as compared with the latter is also much in its favour, even taking into consideration the difference in money value between them; other and important reasons also exist for a preference being given to the seed, which need not here be repeated, as they have been so recently detailed in former papers on the subject.

The numerous inquiries which are constantly being made on the subject are, indeed, the best evidence as to the system of feeding here recommended becoming more popular. That much misapprehension, however, prevails regarding it, is evident from the nature of many of the questions asked as to the manner of carrying it into effect. A Gloucestershire farmer states that he has made good thick jelly from Flax-seed previously ground into meal, but cannot satisfy himself that its effects in fattening cattle are at all equal to that of the common oil-cake, and assumes as a reason for the supposed inferiority of the former, that the seed may not have been sufficiently reduced before boiling, and that therefore a portion of it may have passed away through the animals without having been sufficiently digested. The reduction of the seed into meal before boiling is essentially necessary to guard against the casualty which is supposed, in this case, to have taken place; but having produced a good jelly, there is no good reason assigned for the inferiority of the latter to oil-cake. A few days' trial is not sufficient for ascertaining the comparative merits of different articles of food. Should carefully-conducted experiments as to the value of Flax-seed compared with other articles of food show the inferiority of the former, then good grounds will exist for considering it as an article of inferior importance; but in the absence of any such, and with both theory and practice, so far as already adopted, in its favour, it certainly seems a little premature to condemn it.

The subject of Flax-seed as food is here considered apart from the cultivation of Flax as a remunerating crop. The chief supply, both of seed and cake, is at present obtained from the Continent, from which, no doubt, an increased quantity may be obtained, if required; so that it is altogether a matter of after-consideration how far it may be advisable to raise Flax-seed in Britain in preference to importing it from other countries. When the seed is consumed on the farm, it is certain that Flax is a highly *restorative*, and not an *exhausting* crop, as many have supposed; and from this circumstance, a gradual increase of the cultivation of that crop need not sensibly diminish the production of Wheat.

Experience having proved the great value of house-feeding in almost every case in which it is practicable, both as economising food and adding greatly to the stock of manure, advantage has been taken of the unexampled nutritious properties of Flax-seed to carry that system of feeding into effect, where it could not without this auxiliary be introduced; and instead of the usual method of confinement by stakes and chains, Mr. Warnes introduced the plan of feeding the cattle in boxes, somewhat similar to those in which sick horses, or brood mares with their foals are confined, as a medium between confinement by tying to the stake and mere confinement in open yards, with shelter-sheds attached, as is usual in the practice of Scottish farming. This system, while it affords ample opportunity for moving about in the inclosure, secured a more uniform degree of warmth to the animals—a consideration of which modern science has abundantly shown the importance—and guarded the manure made by the animals from loss by exposure to the weather. This plan of box-feeding is, of course, applicable in the case of other articles of food as well as Flax-seed, and cannot therefore be regarded as a peculiarity consequent on the adoption of that article of food. Many inquiries have been made relative to the construction of these boxes by persons anxious to make a trial of Flax-seed, but it will be seen, that though a highly desirable arrangement for feeding cattle at all times, it is not necessary that the slightest change should be made in the arrangements of the farm-yard for that purpose. For the satisfaction of such inquirers, a description of Mr. Warnes's boxes is given; but it is hoped that these observations will tend to remove much misapprehension which at present exists on the subject, and remove one of the chief obstacles to the more general introduction of the system of feeding so strenuously and justly recommended by that gentleman. The description which follows is that of his own boxes, and given in his own words:—"The description of these buildings is difficult, because however clear and explicit, it must convey ideas of magnitude and intricacy, while neither exists. To make ten boxes, a space will be required of 50 feet long and 12½ feet wide; then let a line be drawn from one end to the other 3½ feet wide, from the side most convenient to the passage. Next let the mould, to the depth of one foot, be excavated from the other part, and thrown on the side intended for the front, and spread to the thickness of a foot deep; this will give two feet from the bottom of the boxes to the surface. A wall of brick-work, 4 inches wide and 2 feet high, is next to be built round the inside of the part excavated, and intersected at distances of 8½ feet. At each angle, the brick-work should be about 12 inches square, which will both support the posts, and afford strength and durability; upon the wall a sill of wood is to be placed, for which purpose large poles, split or square, are adapted. The foundation being now complete, posts 6 feet long, and the necessary sills and ties, may be placed upon it. Across the ties the most ordinary poles may be laid to support a roof composed of the trimmings from hedges and ditches, and completed with a thatch of straw or rushes. Two gates must be added to each box, one of which is to move on hinges, and the other to be secured to the top and bottom sills of the building, so as to be taken down at pleasure. Presuming that advantage has been taken of a barn or other walls on farm premises, the external part is finished. The internal part has merely to be parted off with a few poles between each bullock, and the passage separated by the cribs, which are to move up and down between the interior posts, which are placed upon the angles of each box, and support the roof on the passage side."

Further details regarding the construction of these boxes may be found in a former article in the *Gazette*, page 626, col. *a*, where the arrangements adopted at Horkesley Hall are minutely described. Regarding the expense of construction, and advantages of these boxes, Mr. Warnes states "that the cost of erecting similar ones with the advantage of a wall, including such materials and labour as could be fairly taken into the account, would average from 25*s.* to 25*s.* a box, which will be repaid in less than a year. For instance, if the erection of a box costs 25*s.*, and the bullock fattened in it pays a pound more than he would have done if grazed abroad, the money is of course returned to the pocket, and the box remains free for future inhabitants. To be more explicit, let 20 bullocks be equally divided, and 10 fattened in boxes, and 10 in the yard or field; I assert that the former will pay 13*l.* more than the latter. But in justice to my own experiments I must add, that the advantage of box-feeding would be from 1*l.* to 3*l.* per head on that in the field or yard, and the extra expense of attendance amply repaid by the economy of food."

The directions already given for the formation of the compound, are conceived to be amply sufficient for the purpose, and that a repetition of them would be irksome to most of the readers of this Paper. The details of the system may, in fact, in every case depend on peculiarity of circumstances, to which no general rules would apply. It has been already seen that the farinaceous matters may be composed of any of the usually cultivated grain crops, the inferior portions also being available for the purpose. The directions for making the jelly will be found in page 610, col. *b*, of the *Gazette*, and the quantity of this jelly to be employed is only ascertained by a little experience, being determined by the nutritious qualities of the substances to which it is to be added, as well as the condition of the animals in regard to fatness. For the largest size bullocks, somewhat less than a bushel of Flax-seed will be a sufficient allowance for a week.—*J. Sproule.*

GEO-AGRICULTURAL NOTES ON SOUTH GLOUCESTERSHIRE.

(*Concluded from page 722.*)

Old Red Sandstone.—This formation, which with the silurian rocks lying below it, and the trap rock piercing it, still remains to be described, consists in this district of three distinct members: 1st, a fine-grained sandstone, of a gray or reddish-gray colour; 2d, a coarse sandstone conglomerate; 3d, a red marl frequently alternating with thin beds of sandstone. The first of these, the uppermost, lies around the edge of the mountain limestone, below which it dips. At Millbury Heath this band is of considerable breadth. This rock affords a very good building material, but is chiefly quarried for the flagstones which it affords; when it occurs in very thin beds it is sometimes used as a roofing stone. The second member of the series—the conglomerate—commences near Tortworth, where it is obscured by the marl of the new red sandstones, and runs in a narrow band below the sandstone just mentioned, round the lower edge of Millbury Heath. Near this it is overlaid by the dolomitic conglomerate of Thornbury, on the other side of which, near Kington, it again appears rising in the form of a shallow dome. The third member of the series commences at Tortworth, where it overlies the upper beds of the silurian system, and extends round the edge of the hills by Whitfield to near Thornbury. It is broken through near Whitfield by a dome of silurian rocks, which rise through it.

Below the old red sandstone lie a series of beds of clay, sandstone, and limestone, possessing characters peculiar to themselves. Their occurrence in this district is of limited extent. They have been divided into several distinct beds, to which names have been given, referring to those of the districts in which their characters are respectively best developed. The lowest of them which occur in this district is the Caradoc sandstone, which consists of a series of alternating beds of clay and sandstone. Commencing at Purton Passage, it extends up to Berkeley, and widens out between Stone and Newport, dividing into two arms, the one stretching east as far as Charfield, and the other south-west as far as Falfield, which embrace the northern end of the coal-basin. At Charfield and Damory this rock is quarried as a building stone; throughout the rest of its extent the clay greatly predominates. Above this, at Skeysgrove, an impure limestone occurs, termed the Wenlock limestone. It occurs at Falfield, Whitfield, and Brinmark, where it rises in the form of a dome, dipping on all sides below the old red marl. A section at the quarry at Whitfield shows the occurrence in large quantities of the mineral strontian, overlying the shale above this rock. The quarries at Whitfield and Falfield have long been known as the best sources of road-material in the district.

It is through the Caradoc sandstone that the trap rises. It occurs in several places between Stone and Charfield. It has thrown up the strata on either side, so that they are frequently tilted in opposite directions. It has also had considerable influence in altering the rock it comes in contact with; a comparison of the Caradoc sandstone near Damory with that at Stone or Berkeley, shows the much greater hardness of the former.

Agricultural Character of the Old Red Sandstone, &c.—The district in which the old red sandstone and the silurian systems occur is not distinguished by any peculiarity of surface. It is generally well wooded. In many places it has almost a forest-like appearance, and is completely overshadowed by the hedgerow timber. The Oak and the Elm are the trees natural to it, the one growing on the clays, and the other on the sandstone soil.

The soil on the upper member of the old red sandstone is a keen sand, generally near the rock. One half of this land is under arable culture. In this it does not differ from that adopted on the light soils in its neighbourhood.

The band of this rock is generally so narrow, that those portions of the farmer's experience which would induce him to alter in his case the general practice of the neighbourhood, are overruled by the influence of the example of all who farm around him.

The general rotation is the four-field course, which I have already quoted so often:—1st year Wheat; 2d, Barley: 3d, Seeds; 4th, Potatoes. The crop of seeds is here sometimes substituted by Turnips, but oftener omitted altogether. It is a universal practice on this soil to lime once in three or four years. This is generally done before the Wheat crop. It is spread over the land at the rate of 80 or 100 bushels per acre. The average of the crops per acre are—Wheat, 20 bushels; Barley, 30 bushels; and Potatoes, less than 7 tons. This soil is perfectly fitted for the growth of Turnips, but few Turnips are grown. The soil on the old red conglomerate is generally shallow—a keen sand, full either of fragments of the rock or of pebbles, owing to its disintegration.

The land on the lowest member of the old red is much overrun with hedgerow-timber, chiefly Oak. It is generally a reddish clay soil, partaking more of the nature of the clayey than of the sandstone strata, of which its subsoil is composed: at least 7-8ths of it are in pasture. The Grass, when wet, is of a very poor description—full of the yellow Cow-wheat and the white Moon-flower. Over the whole district the crop of hay will not average 18 cwt. per acre; about two-thirds of it are mown each year, and on many farms this portion is not shifted about among the several fields, but certain fields are mown, and the rest of the farm depastured during a succession of years.

Between Berkeley and Purton, the land is much overrun by Elm and Oak in the hedgerows. A three-field course is here followed—Wheat, Beans, and Potatoes being the crops cultivated. The soil here is sometimes a stiff clay, and at others it is brashy and sandy. If it were drained, the greatest improvement would be effected. Nowhere else in the county would such marked effects follow the use of this invaluable means of agricultural improvement. Drainage not only improves the capabilities of the soil, but it greatly diminishes the expense of cultivation; and this is not an insignificant item in the sum-total of the advantages attendant upon it. The answer to the question—"Would you, if you were allowed, break up a larger portion of your pasture-land?" which I frequently put, was uniformly answered in the negative on the undrained clay soils of the district, and in the affirmative on all the sandy and comparatively dry soils—and this wholly on account of the great expense of cultivation wherever the soil is wet.

The average per acre, near Berkeley, of the Wheat crop is above 20 bushels. The Potato crop generally does not belong to the farmer. The land for the purpose is let to the labourers and others, the farmer first cultivating and manuring it. It is in this way let as high as 8*l.* per acre. The kind of Wheat sown is the old Red Lammas.* On some of the pasture-land, clay-draining has been followed to a considerable extent, and the mole-plough has also been used. The soil is stiff enough to admit of these plans, and at the same time sufficiently free to drain easily, so that great success has followed them. They are, however, entirely unfitted for the arable land, such drains being easily stopped by the treading of horses in soft weather.

Over the whole of the silurian formation the land is pasture, which is similar in quality to that on the old red sandstone. It is superior, however, to that on the poor wet sands of that formation, but with it requires drainage, which it has not. The trap rock, being of very small extent, is not of much agricultural importance. It is covered by a red, apparently ferruginous soil, generally close upon the rock. It is chiefly in pasture, and affords a Grass superior in quality to that on the formation surrounding it, and, in a wet season, superior in quantity also. It is a dry soil, and would pay better to be cultivated as arable land than as pasture. Being fertile, dry, and easy of cultivation, it possesses the three great requisites of good arable land.—*M. S.*

MR. DENTON'S A LEVEL.

Being daily in receipt of communications on the matter of my "A Level," you will, if I may judge from the number of these communications, interest many of your readers by affording me the opportunity of explaining the geometrical problem upon which this simple instrument is based, and the best method of using it in the field.

The woodcut above shows the instrument—its figure will explain the reason of its being called the "A Level;" while the observer will comprehend at a glance its portability and the facility with which it may be used either on the surface or in the trench. The bar B turning up on a hinge and falling into grooves cut in the legs A, these legs may be closed, as a pair of compasses fold; and the whole may be used as a rod for measurement. The legs A are sufficiently narrow to stand in the narrowest trench; while the false feet F afford the means of stationing the instrument on the surface.

The object of the instrument is to assist foremen and workmen in testing and preserving a uniform fall in all works requiring such regularity. A spirit-level, if understood by workmen, is a thing easily put out of order, and is at all times liable to be broken; its use, therefore, is dreaded by workmen, as a process involving too much time, care, and precision, for their fingers to perform.

In draining and sewering, if the first object of the operator is to direct his drains according to the best fall of the ground, the next point of importance is that the floor of the trench, and the course of the tiles, soles, or bricks, should be even and regular from the top to the bottom of the drain. Any hollow in the drain intercepts the sedimentary matter which the flow of the drain-water would otherwise carry out with it; the sectional area of the water-way is thereby lessened, and the sediment, gradually accumulating, after a time causes a stoppage, the drain bursts, and the work has to be re-done.

The level placed in the trench, as it is dug preparatory to laying in the tiles, indicates by the plumb-line any irregularity bad workmanship may occasion. Such use of the instrument is merely analogous to the mode by which the carpenter applies his square and plummet. It is my wish to prove that the extended principle upon which the A Level is based is so sound, that if accurately constructed, the instrument cannot work otherwise than with perfect efficiency, *in determining the average fall of surface between any two spots within sight of each other.*

It should be observed, that the legs of the instrument being equal in length, form, with the base upon which they are placed, an isosceles triangle, and that, when that base is perfectly level the plumb-bob pendent from the apex must necessarily divide the triangle directly in half. This admitted, it is equally clear that by means of a bar connecting the two legs at any given distance, and exhibiting on its face the centre or half of the angle at the apex, any person is competent, guided by the plumb-line, to raise or depress one leg until it stands on a level with the other: the plumb line will then hit the centre.

Now, as the plummet will always hang vertically, by reason of its weight, any rise or depression of either leg is immediately indicated on the connecting bar by the equivalent deviation of the plumb-line from the centre.

The angle A B C is equal to the angle D E F, *i. e.*, the angle made by the hypothenuse or surface with the horizontal line, is equal to the angle of the line dividing the triangle in half, with the vertical line.

Thus, the difference of height between D and E may be calculated by multiplying the natural sine of the angle D E F (read off on the bar as A B C, *if the in lex represents degrees*), by the length of the ground spanned between E and D. In the A Level, this is already done; and instead of degrees and minutes, inches and quarters are divided on the bar, so that the operator may at once read from it the difference of height between the two spots upon which the instrument stands, and *vice versâ*. If it is required to sink one leg an inch below the other, the ground is lowered until the plumb-line strikes the 1-inch division of the index on the bar.

It will be seen, that at a certain distance from the apex, on each leg a line of sight is shown. On the one leg there is a sliding sight-hole answering to a fixed index, agreeing with that on the bar B; on the other leg, there are cross hairs fixed, the centre of which are exactly the same distance from the apex as the nonius of the index on the opposite leg. The line of sight therefore from these two points is ever parallel with the base of the instrument.

To arrive at the average fall of surface from the top to the bottom of a field, the instrument must be placed on a level by means of the plumb-line. The operator must then send forward his assistant-workman to the spot D, at which he intends to end his drain, with a stick marked by a paper fixed in it at a height C above the ground,

agreeing with the height of the cross hairs B, above the base of the instrument. He then slides up or down the sight-hole until he fixes the cross hairs upon the paper in the stick.

This line of sight, C B C, is parallel with the general line of surface, E D (regardless of its sinuosities), and therefore forms, with horizontal line of sight A B A, an angle C B A, equal to the angle D E F, formed by the datum horizontal and the surface.

Now, as the opposite angles of lines crossing each other are equal, the angle A B C is equal to the angle C B A; and we have shown that the angle C B A is equal to the angle D E F; therefore A B C is equal to D E F, and consequently you are enabled to read from the index at C, the angle *converted into inches and quarters*, which is common to the whole distance from E to D. The height thus read off is transferred to the bar B, and retained by the shifting limb G (see the woodcut), to the edge of which the plummet is afterwards worked. This limb is used only to save memory, and assist the man who cannot read.

From the explanation given, I hope I have shown that, without any measurement of distance whatever, the average fall of surface is arrived at without any chance of error, if the span of the instrument is always the same, and the indices are accurately made (agreeing with that space) in the first instance.—*J. Bailey Denton.*

THE ALLOTMENT SYSTEM IN IRELAND.

I am well pleased to find this system making its way in England, and am not surprised it should encounter some opposition. But that the objections of the farmers, as mentioned in the *Agricultural Gazette*, of the 12th October, are ill-founded, I think no better proof can be offered than the beneficial effects produced by the allotment system in Ireland, where with its modifications it has long been in operation. That it is highly advantageous to the labourer cannot admit of question; without it he could not exist in the dearth of employment, and with the low price of labour, in few places exceeding 8*d.* a day: that it is of much, indeed of essential service to the farmer is evident, for without it he could not pay his labourers; in his want of capital it is, in more than nine cases in ten, his only means of working his ground; it constitutes for him a species of credit, while it gives the labourer a security for his wages. The Irish labourer, whose day clothes are often his only night covering, whose bed is straw, and whose dwelling a hovel, is, by this allotment system, independent of the workhouse and of parish relief, and is virtually a capitalist, for he very generally has, through it, his year's provision in advance.

In many parts of Ireland, the pure allotment system obtains, the labourer having more or less land which he holds with his hovel, and when, from his employer, the rent is paid by his labour, at a stipulated price—an arrangement of which he is very glad to avail himself, and in consideration of which he will give a higher rent for his allotment than he otherwise would. I knew a gentleman farmer in the neighbourhood of Portumna, where labourers' wages were only 5*d.* a day, without meals; but they each held from him a hovel, with an acre of land, at 30*s.* a year, the grazing of a cow at 30*s.*, some hay for the winter feeding of the cow, at from 20*s.* to 30*s.* a ton; so that these labourers lived as comfortably as most people of their class, and at the end of the year their accounts were pretty equally balanced. In Tipperary, I found some holding a hovel and an acre of land for two guineas a year, the summer grazing of the cow at two guineas, and the wages at 7½*d.* a day.

What I would call a modification of the allotment system, is the notorious con-acre plan which appears to prevail in Connaught and the central districts of Ireland. Old Grass-land is let in small lots to the poor people for two or three crops of Potatoes in succession, followed by a couple of crops of Oats, at an annual rent of from 5*l.* to 8*l.* the Irish acre—that is, from 3*l.* 2*s.* 6*d.* to 5*l.* the statute acre, according to the goodness of the ground, and its capability of giving crops with or without manure, for the two or three years it is under Potatoes; and from 3*l.* to 4*l.* annual rent of the statute acre for the two years it is under Oats. Another plan more general in the south, is the occupation of a hovel and a perch or two of land, at from 30*s.* to 40*s.* a year, and a portion of land ploughed and the manure placed on the ridges ready for trenching in of Potatoes, at from 5*l.* to 8*l.* the statute acre, according to the goodness of the land and manure, the labourer seeding the land and doing all the labour of it, and working out the rent at from 6*d.* to 8*d.* a day: in these cases the land is only let to them for the crop.

Now, as a good statute acre of Potatoes will be from 8 to 12 tons, and as they are worth from 1*l.* to 2*l.* a ton, and sometimes more, and very seldom so low as 1*l.*, we may take the average—and it is rather a low one—at 1*l.* 10*s.* a ton, and taking the average of produce at 10 tons to the acre, we have 15*l.* for the value of an acre of Potatoes: and as the average rent may be taken at 6*l.* an acre, we find that the allotment system virtually doubles the wages of the labourer, without laying any additional charge on the farmer.

But the allotments of the poorer classes of Ireland are under the worst possible treatment; and as we may expect more and superior management in the allotments in England, so we may expect far more beneficial results. I have no hesitation in saying that an acre of ground, under proper treatment (and I will, at some future period, submit courses for an acre and smaller lots), will give an English peasant as much Potatoes and vegetables as he chooses to eat, a fat pig at Christmas, and the support of a small cow, such as our Kerry, with the exception of her hay, for the year. Half an acre may give him his Potatoes, vegetables, and pig or pigs.

* Goldfinches, which feed almost exclusively on the seed of the Thistle, are very abundant in this neighbourhood. The inference to be drawn from this fact is not very creditable to the agricultural practice of the district.

I assure the farmers of England that I never yet knew an Irishman rendered so independent of his employer as to become a saucy and bad servant from his possessing his bit of land; it is attended with a contrary effect, for his dread of losing it is such that he is made much more subservient, and more to be depended on, than the casual day labourer. He becomes, indeed, an interested person, and I have known him even submit to a blow from his employer, rather than leave his service and lose his land. I have resided in Ireland nearly 27 years, and may, therefore, speak with some confidence on this subject.—*J. M. Goodiffe, Granard.*

Home Correspondence.

Mildew on Barley.—It may, perhaps, interest some of your readers to learn that the little black specks, which are so common on the straw of the late Barley crops, are a form of the true mildew which is so destructive to Wheat. I have never observed Puccinia graminis on Barley before, and the heaps of spores are so small, and completely concealed beneath the cuticle, that their real nature would scarcely be suspected. The parasite is too imperfectly developed to be at all injurious. The grains, especially in shady parts of the field, are much infested with Cladosporium herbarum, which makes them nearly black, and there is scattered over the leaves and sheaths a minute club-shaped, jointed parasite, which gives them a speckled appearance. The crops themselves are very heavy, and have been for the most part secured, notwithstanding the unpropitious weather, in tolerable order, and it is thought will yield a fair sample: the heaviest crop was not sown till the 17th of June. Those portions only which were reaped have suffered from the wet, in consequence of the sheaves being more tightly bound, and therefore not admitting so free a current of air. The mould which your Buckinghamshire correspondent found on Wheat, and which proved to be a form of Erysiphe communis, has been, I believe, almost universal, but it does not appear, in any case that I have witnessed, to have been injurious to the produce, though so very abundant. With us, those portions of the leaves and sheaths were most affected that were covered with the red rust, a parasite which, though so much dreaded on the Continent, even more than mildew, as it should seem from Philippar's account, does not appear in Great Britain to do much harm, at least to the red Wheats. —*M.J.B.*

Gypsum and Guano.—In the *Agricultural Gazette* for Oct. 19, a correspondent is informed, that it is questionable if gypsum would tend to fix the ammonia in guano unless both were dissolved in water. From some experiments which I have recently made, it appears that gypsum acts upon the insoluble part of guano, and produces a soluble sulphate; nothing more than perfect contact of the two compounds being effected by the water in which they are placed. After washing a portion of guano very frequently for several days, until every trace of its soluble salts was removed, I added 50 grains of gypsum to 100 grains of the insoluble residuum of the guano. In the course of two or three hours a decided action had commenced. The evaporation of a few drops of the water in which the gypsum and guano were placed, gave a large supply of microscopic crystals, and about 10 grains of soluble sulphates, the sulphate of ammonia being one, were ultimately obtained. My former short notice on this subject showed that the sulphuric acid of the gypsum fixes ammonia, if its salts be dissolved in water; and by the present experiment it appears that, under the action of gypsum, even insoluble portions of guano may be made immediately available for the food of plants. This effect, resulting from the perfect contact of two insoluble bodies, will seem to be the less surprising, if we bear in mind that even two elements, two of the metals, when placed in contact, not in water, but in atmospheric air, immediately liquefy each other — *J. B. Reade, Stone, Aylesbury.*

Railroads.—Has it occurred to you what may be the effect of these railroad works that are everywhere intersecting our properties, and absorbing our land? It is worthy of the consideration of those who are engaged in agriculture, what the results of this all-absorbing mania may be in regard to rents and rent-charge, and as affecting the aggregate produce! Farmers should be looking out; and the sooner they get leases of their landlords the better, I am inclined to think, for them and their families. The venerable Laureat, as in your newspaper of last week, may well protest, though, alas, in vain! And another in vain supplicates for the favourite and cherished Elm or Oak of his early care. Should the Colossus of *Roads* penetrate the park of Blair Athol and others, where the Queen and Prince Albert planted their pairs of Oaks, would they be spared? But the pocket, of course, before the refined pretensions of sentiment, and the M.P. will be the arbiter after all; and if he be a proprietor, we can see (without the aid of Lord Rosse's telescope), which way his vote will go. But consider what thousands of acres of land the rail has already taken out of all possibility of cultivation, and draw your own conclusions.—*An Early Contributor, and an Original Subscriber.*

Chidham Wheat.—I transcribe for you, from "Young's Survey of Sussex," published by the Agricultural Board in 1813, the account of the origin of this variety of Wheat:—"The farming world is certainly indebted to Mr. Woods (of Chidham), for a valuable acquisition, in bringing into cultivation, what with justice has been called, and is a new sort of Wheat, the Chidham White, or Hedge-wheat. The origin of it was this:—As Mr. Woods was occasionally walking over his fields, he met with a single plant of Wheat growing in a hedge. This plant contained 30 fair ears, in which were found 1400 corns. These Mr. Woods planted the ensuing year, with the greatest attention, in a Wheat field: the crop from these 1400 corns produced 8½ lbs. of seed, which he planted the same year, and the produce amounted to 48 gallons; this he drilled, and it yielded 15½ quarters, 9-gallon measure. Having now raised a large quantity of seed, he partly drilled, and in part sowed, the last produce broadcast, over rather more than 50 acres of land, and he gained 38½ loads—20 loads of this quantity was sold for seed at 15*l.* 15*s.* per load. The Wheat, upon trial, was found to be so fine, that Mr. Woods had an immediate demand for a far greater quantity than he could spare for sale; 1792 turned out a bad yielding year, otherwise the last produce would have fully equalled 45 loads. With respect to the sample of Chidham Wheat, it is white, of a very fine berry, and remarkably long in the straw, so as to stand in a wet summer full 6 feet in height. The seed is now (1813), dispersed over Hampshire, Surrey, and other counties, and much cultivated about Guildford.—*J. S.*

The Cotswolds.—In your *Gazette* for Oct. 5, I find among your "Notices to Correspondents," in reply to "G.", you describe the soil of the Cotswold hills to be "poor, thin, and brashy." I have resided the greatest part of my life upon the Cotswolds, at Salperton, which is situated between Northleach and Andoversford, and though much of our soil is as you describe, I do not believe it varies more in any part of England. I can answer for it that in my parish we have not one ground without a variety of soils. Some of our stone brash is quite deep in soil (I am not speaking of the valleys), as you will suppose when I mention that I have grown many of the large Belgian Carrots, five pounds weight, without manure, upon a farm which was so wretchedly cultivated that I was obliged to take it in hand four years ago. We have, also, a good deal of very stiff clay, and still more of a very deep soil, called in the country a dead earthy soil, on which, as elsewhere, great benefit is derived from paring and burning, though I am sorry to say, some few landlords are, to the injury of their land and the ruin of their tenants, discontinuing it. You then say, "No cheese is made there." Of course not in the same quantities as in the vale; but I will answer for it that, upon at least one-third of our farms, cheese is made. Cheese has been made from time immemorial in my parish, and it is very highly spoken of by those who taste it. You then say, "Turnips are sown broadcast; but the farmers rarely use artificial manure." Now I should much like to know where you obtained your information, for it would almost puzzle you to find one farm where the Turnips are all sown broadcast, certainly in our neighbourhood; and I understand at the Cirencester Cattle Show, nearly all the competitors for the best field of Turnips, raised them with artificial manure, and if not upon the ridge system, by drilling upon the plain surface. I cannot call to my recollection one farmer who does not use some sort of artificial manure. There was one of my father's tenants who never had, and last year I persuaded him to let me have a few loads of straw, and pay him with bones, which bones I stipulated to put on with my drop-drill. I did this in a great measure to remove prejudice, and though we only put 4 bushels per acre with, I believe, about 16 of turf ashes, he has got better Turnips there than any part of the field with farm-yard manure: indeed, had it not been for the large grub, which has destroyed thousands of acres of Turnips upon the Cotswolds this year, he would have had a very fine crop. I was in great hopes somebody else would have taken notice of your paragraph, but this not being the case, I could not refrain from answering it myself. I will, if you wish it, give you some slight account of the Cotswold system of farming from time to time. [Thank you].—*T. B. Browne.* [You needed to have read "G.'s" communication, to have become qualified as judge of the accuracy of our answer to it. The statements as to cheese-making, and the use of artificial manures are, comparatively speaking, correct, *i. e.* but very little cheese is made, and but very little artificial manure — in the sense in which "G." employed the term — is used. We know that the drill cultivation of Turnips is rapidly acquiring general adoption on the Cotswolds, but that does not hinder us from admitting the truth of "G.'s" supposition, that broadcast culture still to a great extent exists.]

Allotments.—I have read with interest all that your columns have contained on this subject, and am myself endeavouring to pursue some such system in the village where I reside, convinced that it presents a very important means by which to improve the condition of an invaluable class of the community. The suggestion I have to offer, is therefore, made in no unfriendly spirit; yet I confess I am not without very strong misgivings that sooner or later, according as the system of providing the labourer with a patch of ground for his own cultivation may become established, advantage will be taken of his dependent state to turn this present well-intentioned scheme of good against him, and convert it into a medium by which still further to lower his condition. I fear that it will be made a handle to lower still further the wages of the agricultural labourer; that the farmer, taking into calculation the advantages which a labourer and his family may derive from the cultivation of his little allotment, will convert them into an element by which to measure the minimum daily or weekly stipend on which a labouring man may subsist. The allotment system, by this perversion of its humane intent, may thus, in its ultimate effects, promote the very evil it is meant to correct, its first tendency being to increase population by improving the condition of the present generation, while, if my anticipations should unhappily be realised, its remote consequences will be a return of the privations and poverty consequent on insufficient wages, and operating upon a wider spread surface of society. The probability of the evil is more obvious than the preventive. It becomes, however, the duty of every friend to humanity to be alive to the possible consequences of a measure which now has the support of the most philanthropic spirits of the age.—*Rusticus*

Professor Johnstone's Lectures in Perth.—The following is an explanation of the great variety of opinion regarding the use of common salt as a manure. Here Farmer *A.* had, on the side of the hill facing the sea, applied salt to a considerable extent in various ways, but never found that it did any good. *B.* and *C.*, in the inland valley, had also used it, and with very beneficial results. Farmers *A.* and *B.* meet in the market-room, and among other subjects a discussion arises upon the use of common salt as a manure. Farmer *A.* says, "I have tried it often, and in different ways, and I never could discover any difference in favour of the crops that had been salted beyond those that had not. I am, therefore, satisfied it is of no manner of use whatever, so that I have made up my mind to use no more of it; it is only so much time and money thrown away; and, more than that, it has prevented me using such manures as might have been of some benefit; so what with purchase-money and carriage, labourage in putting it on, and a partial failure of my crops, that might have been so much better had I used something else, and not depended upon it, I am a considerable loser, and have, therefore, learned a lesson I am likely to remember." Upon which farmer *B.* says, "I am rather surprised at your statements regarding common salt, as I have been using it for some time, and have always observed a very decided difference in favour of the crops where I applied it, and on that account I am likely to continue to use it while I am satisfied of its beneficial results." Another farmer from the sea aspect says, "I have used salt a good deal, and can confirm the statement of my friend from the same district, that it is useless as a manure, and have also made up my mind to give it up; experience, and the evidence of my own senses, telling me it is good for nothing." In this way the discussion goes on, those from the *A.* side of the hill being against it, and those from *B.* to *C.*, &c., in the valley beyond, as invariably for it, until the question whether salt is of any use as a manure is finally put to the vote. The Professor dwelt upon the evil tendency of such an argument upon effects, without some little knowledge of the causes. He called attention to a Table showing the quantity of common salt contained in different crops, and explained the maximum amount that any land was likely to require of it; and that on the sea becoming agitated by the winds the salt which rose in the spray and was carried on to the land was of considerable quantity, when it was found that houses as much as 20 miles inland had their windows incrusted with it, so that tracts lying within the influence of the sea-breeze could not be in want of it. The management of dunghills then came to be considered, and the generally bad system pursued. He said they were generally placed upon the driest part of the steading, and if that was not dry enough, drains or gutters were carefully cut from them to some lower place, and from that to the nearest brook, where the best and richest part of the manure found its way to the nearest river, and washed onwards to the sea. The Professor here said, "What would you think if, on your going home at night to tea, you found that the water had all been drawn, and that nothing was left but the leaves? You would be likely to complain; but under such circumstances you would have no more reason to do so than your farms have to complain; you waste your farmyard tea, and you carry to your land the leaves."—*A Subscriber.*

Two Crops per Annum.—In the counties of Berks and Oxford, Turnips or Rape is very often sown with Beans or Peas; the seed is sown sometimes between the rows with a small hand-drill, and sometimes broadcast just before the last hoeing; I have Tankard Turnips sown with Beans this season, now ready to be fed off with sheep, some of the roots weighing from 3lb. to 4lb. The crop of Beans was very good.—*J. C. C.*

Prevention of the Fly in Sheep.—I have heard that an excellent way of preventing sheep being struck with the fly, is to mix train oil and sulphur to a moderately thick substance, and then occasionally draw a brush down the back of each animal, during the season that the fly is about. Once a month is said to be sufficient. Can you say if it is effectual, or will some practical farmer give his opinion on the subject?—*M. A. S.* [Your plan will very frequently succeed in preventing the attack of the fly, but a more simple and effectual method is the occasional application of coarse whale oil.—*W. C. S.*]

Fire-clay as a Manure.—Mr. Isaac Anderson says, (p. 692, *Agricultural Gazette*, 1844), Mr. Sprot "planted two Potatoes with a large spadeful of well rotted hotbed stable-dung, well incorporated with the soil: two others he planted about 18 inches from the above, incorporating with the soil an English pint of Garnkirk fire-clay." I do not think the experiment conclusive as to the extent of the fertilising quality of the Garnkirk fire-clay, for though this clay might make the soil more retentive or attractive of moisture, and so far of service to these two Potatoes, yet from their close proximity to the dunged ground, they probably received as much benefit from the effluvia that proceeded from it as the dunged Potatoes did, while this proximity would, if the clay is attractive of moisture, which it probably is, have tended to deprive the dunged Potatoes of moisture, to which the stable-dung also assisted. Had the dung been of the byre instead of the stable, and the distance greater, I think the result would have been different.—*J. M. Goodiffe.*

Hop Garden.—I am about to commence a Hop-yard, but being myself inexperienced in the system, I have had recourse to my neighbours for information. I find they invariably recommend the removal of all the male (or barren) plants, under the idea that as they never bear, they are useless. I know practical men are often right when they seem to be wrong, but I should have expected that the perfection, if not the quantity and weight of the Hop, would have been best secured by impregnation. I should, therefore, be much obliged if you would favour me with your opinion on the point; informing me what is the practice among the best growers in Kent, Sussex, &c., and particularly how many barren plants it would be desirable to have in every hundred. I presume it will be necessary to plant them singly, and not two or three plants together, as is the general course. I am myself inclined to plant ten per cent. I should further be obliged by the names of the best kinds, Kent Hops especially; of the hardest and best bearing, and an intimation of the name and address of the party from whom proper cuttings might be obtained. I understand Hop-growers themselves, and not nurserymen, provide them.—*Humulus, Bradford.*

How to store Cabbages.—Peter Mackenzie tells us "the Cabbages are put in heaps in a manner like cast-iron bullets in an arsenal;" but as few English farmers have had the advantage of an education at Woolwich, and as many of those of the interior have not even seen an iron bullet, let alone an arsenal, they may not understand how a pile of balls is made. As it may also give Cabbage-growers more confidence in storing, to be informed that over a large tract of country it is generally done with success, I will state the practice throughout the province of Connaught and neighbouring parts. About a month before Christmas the Cabbages (the roots being cut off), are ranged as close as possible in parallel rows of any length—say six rows; on the tops of these, five parallel rows are ranged; on these again four rows; on these three, then two, and one row finishes the heap; a little straw is placed over them to keep the earth from them, and they are covered about a foot thick with earth beaten down so as to exclude air and rain; they are thus finished off like the roof of a house; no straw or anything is mixed with them. Of course advantage is taken of a dry day; and it is better to lay the tops downwards, that any moisture may drain from them. The first rows may either be placed on the surface, or a pit may be excavated to the tile.—*J. M. Goodiffe.*

Sea Buckthorn.—Will your correspondent "M. D. P.," who, in your *Gazette* of the 26th of last month, alludes to the plant called Sea Buckthorn, favour us with some further particulars respecting it? From the properties he describes it to possess—of growing freely on sand-hills, and especially of not being liable to be attacked by rabbits—it would be most valuable in some localities. Will it grow and be useful as underwood, and in inland districts? Perhaps "M. D. P.," or some of your correspondents, will oblige us by describing it more particularly, and state if it is to be met with in any other parts than those referred to. Upon inquiry, I cannot find that it is known under the name in question.—*An Old Subscriber.*

A Correspondent, in the Number of the *Gazette* for Oct. 26, asks who is the author of the saying that "whoever could make two ears of Corn, or two blades of Grass to grow upon a spot of ground where one only grew before, would deserve better of mankind, and do more essential service to his country, than the whole race of politicians put together." I beg to inform him that the King of Brobdingnag made the observation to Mr. Lemuel Gulliver.—*Rd. S.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The Council resumed their sittings for the Session, at the Society's House in Hanover-square, on Wednesday last, the 6th of November. Present—William Miles, Esq., M.P., in the chair; Viscount Hill, Colonel Austen, Thomas Raymond Barker, Esq.; Samuel Bennett, Esq.; French Burke, Esq.; Humphrey Gibbs, Esq.; T. B. Brandreth Gibbs, Esq.; Stephen Grantham, Esq.; Henry Handley, Esq.; W. Fisher Hobbs, Esq.; W. H. Hyett, Esq.; John Kinder, Esq.; Francis Pym, Esq.; James Allen Ransome, Esq.; Professor Sewell, William Shaw, Esq.; and Professor Solly.

Henry Drummond, Esq., of Albury Park, near Guildford, Surrey, was elected a Governor, and the following gentlemen Members of the Society.

Talbot, Hon. and Rev. W. Chetwynd, Ombersley, Worcester
Jones, W. Tilsley, Gwynfryn, Aberystwith, S. W.
Giraut, Moses, Mainland, St. Lawrence, Jersey
Southampton, Lord, Whittlebury Lodge, Towcester, Northamptonshire
Thomson, Henry, Primrose, Clitheroe, Lancashire
Roper, John, Foscott, Buckingham
Grant, John, Dartmouth, Devonshire
Green, Rev. Thomas, Vicar of Badby, Daventry, Northamptonshire
Smith, Benjamin, Colebrooke Park, Tonbridge, Kent
Ormerod, George, D.C.L., F.R.S., Sedbury Park, Chepstow, Monmouthshire
Galpine, Richard, Lymington, Hants.
Sanders, Samuel, Lockers, Hemel Hempsted, Herts.
Williams, Leigh, Farnham, Surrey

Finances.—Mr. R. Barker, Chairman of the Finance Committee, laid before the Council the Report of the Society's funds on the last day of the previous month; from which it appeared that the amount of invested capital was 7700*l.*, and the current cash-balance in the hands of the bankers, 928*l.* This Report was then confirmed, and cheques ordered for the various payments recommended by the Committee.

Colonel Austen called the attention of the Council to the large amount of arrears of subscription still remaining unpaid, notwithstanding the constant reference of the Finance Committee to the subject, and the reduction of no less than 1223*l.* of arrears during the last six months; and trusted that some still more vigorous and decisive step would be taken by the Council to insure the payment of the subscriptions as they became due from year to year, and thus remove the anomalous condition under which the accounts of the Society were placed by the omission of annual payments, and the consequent accumulation of arrears.

Mr. Pym, Mr. Fisher Hobbs, and Mr. Kinder having stated the success which had attended the efforts they had made in their respective counties of Bedfordshire, Essex, and Hertfordshire, as Honorary Collectors of the Society's subscriptions from the members residing within those districts, expressed their willingness to continue their exertions in the care of such collection, and to aid the Council in extending the system of such friendly co-operation, through members of the Council, to other counties. Mr. Pym then gave notice, that at the Monthly Council to be held on the 4th of December next, he should move, "That county or district collectors should be appointed for the purpose of getting in the subscriptions of the Society."

Elections of Council.—On the motion of Mr. Raymond Barker, seconded by Mr. Shaw, the Council resolved unanimously, that Philip Pusey, Esq., M.P., Chairman of the Journal Committee, should be requested to accept the office of a Trustee of the Society, vacant by the decease of His Grace the Duke of Grafton. Mr. Thomas Lockley Meire, of Cound Harbour, near Shrewsbury, was elected a Member of Council, in the place of the late Mr. Edward Gough, of Gravel Hill, near Shrewsbury.

Implements at Southampton.—Mr. Parkes, Consulting-Engineer to the Society, communicated to the Council the doubt and difficulty under which he this year laboured in drawing up his report on the trial and exhibition of Implements at the Annual Country Meeting of the Society, from the circumstance of his acting at Southampton simply as the mechanical referee of the Judges, and not as formerly as an actual judge himself—an arrangement which, to a considerable extent, placed him under the condition of an ordinary inspector of the implements, and excluded him from the more immediate communication with the judges at the trials which determined their awards, and which was essential to his being enabled to make a complete and satisfactory Report. The following resolution was then passed:—"That it is the opinion of the Council, after considering the letter addressed to them by Mr. Parkes, that Mr. Parkes should draw up the Report from the reports of the Judges, for which they are solely responsible; but that upon all trials which he himself viewed, it will be competent for him to make any remarks he may think necessary, as well as upon the whole mechanical appearance of the Show."

Mr. Shaw gave notice that at the next Monthly Council in December he should move:—"That the trials of implements be in future made at such time and place as the Society may find best adapted to the circumstances, and not confined to the Annual Country Meetings of the Society.

Shrewsbury Meeting.—Earl Spencer, Chairman of the General Shrewsbury Committee, addressed a communication to the Council in reference to the arrangements of the Annual Country Meeting, to be held at that place next year; and Mr. Brandreth Gibbs reported the result of his personal visit to Shrewsbury, and his interview with the owner of the fields intended for the trial of implements, and which had been now placed, agreeably with the instructions of Mr. Shelley and Mr. Miles, the stewards of that department, under proper cultivation for that purpose. Mr. Gibbs also reported that Earl Spencer and Mr. Taylor had undertaken the trial of the Wheat, selected at Southampton for cultivation in reference to the Society's prize.

Prize Essays.—Mr. J. A. Gordon, of Naish, near Bristol, addressed a communication to the Council, in which he proposed to place the sum of 30*l.* at their disposal, as a prize for the best Essay on the Influence of Electricity on Vegetation. The Council ordered their thanks to be given to Mr. Gordon for this liberal offer, and referred the consideration of the subject to the next monthly Council. Mr. Shaw expressed his regret to find that all the Essays to which the prizes of the Society had been awarded, had not been published in the Journal; for, although the one in which he was himself much interested—"On the Mechanical Properties of the Plough"—had been placed, he was informed, in the hands of its lamented author, the late Rev. W. L. Rham, for revision and extension, and remained incomplete at the time of his decease, there were other Essays to which prizes had been awarded, but which had not yet been published.—The Chairman explained to Mr. Shaw, that, independently of the Essays, which it was thought not desirable to publish under their present form in the Journal, there were several others whose appearance was delayed in consequence of the extent to which the pages of the Journal had been occupied by the Prize Reports on the farming of the various counties already selected for consideration; that on the county of Norfolk having proved so voluminous that its author had preferred its entire publication on his own account, to the requisite abridgment of its details for the Journal.

Ashes of Plants.—The Marquis of Northampton, and Sir John Johnstone, Bart., M.P., communicated to the Council a proposal, on the part of the British Association, that the Society should join with that body, in contributing a sum of money from its funds for the purpose of obtaining a complete series of analyses on the ashes of plants, from various localities, to be made under the immediate superintendence of Professor Graham, who had liberally placed his services on this occasion gratuitously at the disposal of the two Institutions. The consideration of this question was postponed until the monthly Council in December.

The communications of M. Hugues on his sowing machine having been referred to the Journal Committee, and his offer of a model accepted, thanks were ordered for the numerous donations made to the Society, and the Council adjourned for a fortnight, until Wednesday, the 20th of November.

FARMERS' CLUBS.

Groombridge.—At the late annual meeting of this Association the following remarks were made:—Mr. Hammond, of Penshurst, said that last year he sowed a field of Swede Turnips in rows. One part of the field he manured with good rotten dung from the fatting stalls, at the rate of 30 loads per acre. Close beside it he drilled in guano, at the rate of 2½ cwt. per acre. The Turnips where the guano was placed were the best up till the middle of the summer, when he fed them off, and the crop in that field this summer was quite as good where the guano was put as where he manured it with dung.—Mr. G. Wickens had used guano on meadow land, and one could tell to an inch where it was laid, the Grass was so greatly improved.—Capt. Aitchison spoke from experience of the effect of manuring with soot on his land. The eight-acre field, where the ploughing-match was held last year, he sowed with Wheat, and top-dressed it with soot, in the autumn, at the rate of 50 bushels to the acre, and he had a most excellent crop of Wheat, and a finer piece of young seeds he scarcely ever saw.—The chairman believed, in this part of the country, mould taken from hedges and mixed with dung or lime was a very favourite manure with the farmers. Now, it occurred to him that by spreading this mould over their land they sowed a great many weeds, else where did the great quantity of weeds found in the farmers' fields come from? He saw, go where he would, a great many weeds, and he was inclined to think that the mould taken from the ditches, although it might be valuable to the land, contained a great many weeds. He thought that artificial manures were preferable in this respect: they did no harm.—Capt. Aitchison was of opinion that the farmers were too apt to spare the labour of turning the mould heaps sufficiently often to destroy the weeds. His mode was to turn the mix hills three times at least, and he was satisfied it paid the farmer. Thus the whole of the seeds were brought into life and destroyed before being carried into the fields.

Saffron Walden.—The following are portions of a speech by Ph. Pusey Esq., M.P., at a late Meeting of this Society:—He said there was one subject that occupied the attention of the country—the improvement of the condition of the agricultural labourer; and on that point he would beg to throw out some considerations for them to pass their opinion upon. He would say that he thought credit was due to Lord John Manners for his endeavours to revive the old amusements of the peasantry of this country. He might quote a practical authority on the subject—the Speaker of the House of Commons—who told him in 1830, when outrages took place, that they would all remember that there were about 30 parishes in Hampshire, known as the cricket parishes, and in these parishes no disturbances occurred. Emigration was talked of as a remedy for the evil felt; but he thought those who talked of this were not aware that the population had flowed to Canada, the United States, and other parts, to the amount of 100,000 a year. He did not think this could be looked on as a national remedy for what was called the "surplus population." Then they had the allotment system proposed, and on that subject he would speak confidently. He was aware that there were objections to it on the part of the farmers; he found that was so when he carried it into effect 14 years ago; but that was passed away, and the farmers, he believed, no longer feared allotments. For the last 14 years he had had 400 or 500 allotment tenants, and it certainly had answered extremely well. But still, this must be regarded as a palliation; it was not a sufficient remedy for the present want of employment; that remedy was to be found in the employment by the landlord of the surplus population of the villages during the season, in permanent improvements of the soil. He learned this from his relative Lord Kinnaird, who, 30 years ago, used to employ a number of labourers in improvements on his estates; Mr. Pusey had done the same himself: and he believed, if he could get this principle established in every parish, we should hear no more for some years of a surplus population. He did not think gentlemen were aware of how far money would go in improvements. If they had men for 10*s.* a week for the winter months, for 300*l.* they might employ 50 labourers, and they would not only benefit them but all the other labourers, because as a little corn thrown in would sometimes spoil the whole market, so if they withdrew these labourers they rendered employment better for all the others. Then the question came, Where were the landlords to find funds for this purpose? He knew this country well, and he knew there was not a place from Plymouth to Berwick in which landlords might not make improvements; but when the tenant was short of money, the landlord generally would be short of money too. But he would tell them how to find funds. There were many districts where there was a great superfluity, not only of useless but of mischievous timber, and if they would cut that

down, which excluded the sun and air and fed on the soil, and sell it, they would benefit the farmer and the labourer too by laying out the proceeds in under-draining the soil. There was another mode in which they might find money. He knew that on some properties a large sum was spent in the preservation of game. It was not at all unusual for the game to cost 500*l.* or 600*l.* a year; and if this were given up, the money would employ 100 able-bodied labourers in improving the property. This was another fund for the landlords of England to benefit the labourers, and the farmers at the same time. Still, if the landlord did his utmost he might not be able to find money sufficient for the purpose; but let him give security to the tenant, that if he will lay out his money in permanent improvement he shall reap the reward of the outlay. This might be done by a lease, and it might be done without a lease, for they ought not to lay down an absolute rule, as leases were not universally applicable, and it was not desirable that the landlord should give up the land for 10 to 14 years to a man that was not able to do justice to it. But without leases there was a plan adopted in Leicestershire, by which they might give security for money expended in improvements. If a farmer boned his land, it was supposed that would not be exhausted in less than three years; and if the tenant left the first year, he received back two-thirds of the expense. Then if he chalked the land, that was not exhausted under ten years; and if he left it in five years, he received back one-half. Therefore, if the landlord objected to granting a lease, he said let him give security in this way for the outlay in permanent improvements on the land. There was another source of employment for the population—that was the breaking up of Grass land. He had broken up a great deal of Grass land himself, and he never repented of it. It appeared to him, that since the system of fatting cattle on artificial food Grass land had sunk in value. Now they would see at once the great increase of employment that would arise from breaking up these lands: they might reckon one labourer for 100 acres of Grass land, but it would take four to 100 of arable; and thus if they had 500 acres of Grass land, and broke it up, instead of five families they would employ 25 on it, which would considerably relieve the distress.—Mr. Edward Solly then entered deeply into the mutual benefits conferred by chemistry on agriculture, and *vice versâ*; and gave a short sketch of the progress of agricultural chemistry during the last few years, pointing out the value of science in all practical matters, and more especially drawing attention to those parts of Agriculture which were likely to be benefited by chemical science. He stated that phosphate of lime existed in large quantities in Wheat flour, and that it was necessary that a proper quantity should be afforded the plant, in order to bring it to perfection, as well as those materials necessary to the formation of starch and gluten. A gentleman named Lawes, had endeavoured to produce superphosphate of lime in large quantities by burning bones, and adding thereto sulphuric acid. This was an excellent manure. He could not, however, procure enough bones for his purpose. Professor Daubeny had visited Spain, at the request of the Royal Agricultural Society of England, and found phosphate of lime to exist there in large quantities, but the heavy expense of land carriage prevented its transmission to this country. It was, however, very probable that large quantities existed below the surface of the soil in this country, which had only to be brought up and spread upon their lands to excite fertility. He had, at the suggestion of Professor Henslow, visited a part of the east coast, where he had seen hundreds of tons of the required material in the shape of coprolites, one of which he held in his hand, though from its appearance no one would suppose that it contained the most essential manure for the production of both plants and animals. The value of phosphate of lime being known, chemists and others would seek everywhere for cheap and abundant supplies of it, and he had no doubt the search would be successful.

Rebiews.

Practical Treatise on the Use of Peruvian and Ichaboe African Guano, &c. By J. H. Sheppard.

Another of the many pamphlets on this subject, to some of which we have already directed the attention of our readers. It is full of convincing testimonies to the value of guano as a manure, and it contains many useful directions how to apply it.

Miscellaneous.

On Ploughing Old Pasture Lands.—With the consent of the proprietor, two pieces of old turf of the second class were ploughed this spring, after proper drainage, in the parish in which I reside, and sown with Oats in the usual way. The produce of the first piece is estimated at 70 bushels per statute acre; the second piece, only a part of a field, produced 64 bushels per acre; and I have no doubt of the successful cropping of this land for a series of years, in the hands of the present good managing tenant. A part of this field, containing about fourteen acres, remained unploughed, and was not stocked in the spring, but mown for hay in July. The produce was gathered in, the whole amounting to about five tons, and but little herbage has grown since. It is easy to see the relative position of the occupier with regard to these two pieces of land, without going to figures. I am aware that it will be said the excessive drought that has lasted so long this summer is the cause of the failure of the Grass-land, and this is fully conceded, and this fact strengthens the evidence in favour of ploughing; inasmuch as it gives the farmer a greater control over the elements, in order that they may be made subservient to his interest. The master may pass over the Grass-land and make his silent remarks, but has no power or control over it. But not so in the other case: he can plough deep; he can hoe and harrow; thus pulverising the soil, rendering it capable both to attract and retain moisture; apply various manures, giving a stimulus to the young plants, and enable them to resist in a great degree the inclemency of the season, whether from excessive heat or excess of rain; and there remains but little doubt that when all the sciences connected with agriculture are brought fully to bear upon the land, the farmer will have, if not a complete, a successful control over the elements, so far as production may be concerned. It may be observed also that this description of land was put into Grass at a period when the population of this country was limited and small, and that there has been a vast accumulation of vegetable matter going on for generations, laid up in store by Providence for the supplies of the future, all of which might easily be converted into food for man, and a return given back which would produce food hereafter.—*Thomas Underwood, in the Northampton Mercury.*

Guano.—I could give the names of scientific farmers who applied guano three years back, that, without any better treatment than the ordinary mode, in the same field can be discerned on Clovers this year at a very considerable distance, where it was applied against the richest farmyard decomposed dung, in the same field; this I account for by having used genuine Peruvian guano—for African Ichaboe guano was not known at that time. The failure in so many instances where guano has been lately applied is from its spurious quality, the improper mode of application, the mixture of lime, &c.—*J. H. Sheppard, Chester, in the Farmers' Journal.*

Notices to Correspondents.

Advertisement.—*R. A.*—The Advertisement will cost 5*s*. Shall we insert it?

Books.—*I. G. T.*—We cannot mention prices. Apply to any bookseller.

Book-keeping.—*E.*—We do not see that you need charge upon your returns for the year any per centage whatever on your invested capital—*i. e.* if it be all your own—before balancing your accounts. In *anticipating* the result of your proceedings for the coming year the case is different; for then, to insure accuracy, you must deduct from your estimated returns various per centages on different portions of your invested capital, according to what experience tells you will preserve its value from depreciation. Thus, 5 per cent. on the present value of your sheep must be deducted, for this will be required to replace the losses of the year by death or accident; 10 per cent. on that of your horses must also be deducted to cover the losses and injuries which *they* may sustain—and so on. At the end of the year, however, you have to collate facts, not to estimate probabilities; and if your valuations of stock be just, the simple difference between that at the beginning of the year + the amount of purchases and expenses during it, and that at the end of the year + the produce of sales during it will obviously represent the financial result of the year's proceedings.

Carcase.—*S. W.*—Chop it up, and cover the pieces with thick layers of your vegetable matter and pounded chalk; you had better not put clay or salt in the compost, unless you wish to retard the process of decomposition.

Dipping Sheep.—*H. F. Campbell.*—4 lbs. of Mr. Bigg's Composition suffices for 20 sheep. Mr. B.'s address is 15, Crawford-street, Portman-square, London.

Fullers' Earth.—*Delta.*—Your remarks go to prove, not that fullers' earth contains alum, but that it contains alumina, which is only one of the three constituents of which alum is composed, the other two being sulphuric acid and potash. The effect of alum as a manure would more probably be owing to these than to the alumina which it contains.

Lucerne.—*D. H. L.*—One can hardly judge without seeing it. What has destroyed it? You may as well leave it till spring. You will be able to foresee the fate of your plant before it be too late for Swedish Turnips, especially if you can use Crosskill's clod-crusher, and so obtain a tilth in spite of weather.

Mr. Warne's Boxes.—*T. M. and a Subscriber.*—See to-day's Article, by Mr. Sproule.

Sea Mud.—*M. D. P.*—Certainly: have it ploughed before winter; the summer's fallow recommended was additional to this. Frost cannot be expected to deprive mud of excess of salt, except by increasing its porosity, and thus facilitating the action of future rains, in washing out its soluble ingredients. Lime decomposes salt, and may thus deprive it of some of its noxious properties; perhaps, however, muriate of lime and carbonate of soda, which are the resultant compounds from this process, may be as injurious in excess as common salt. We have no facts to determine the quantity of the latter substance, which may be beneficially applied per acre.

Spade Husbandry.—*Malum*—Where can Dr. Yelloly's fork be obtained? The Vernon hoe has a dart-shaped blade, attached to a handle, with a swan-neck shaped termination. It is useful for opening drills for seed or sets, &c.

Trifolium incarnatum.—*R. G.*—Autumn is the proper season for sowing Trifolium incarnatum. Can any one give us his experience of it? Spring is the best season for manuring meadow land with guano. Apply 3 cwt. per acre.

Vetches.—*Paddy*—In a luxuriant crop the lower parts of the plant will be certain to wither and rot. We know of no efficient remedy. Oats and Rye, sown with the seed, have but a slight tendency to support the plants.

Waste of Fences.—*A Quiet Observer.*—Will you be kind enough to explain your meaning. What, in reference to quicksets, is "preserving the spring."

*** As usual, many communications have been received too late.

Markets.

POTATOES.—Southwark Waterside, Nov. 4

In consequence of the contrary winds the arrivals during the past week have been limited, which has caused a considerable clearance; several parts of cargoes of inferior samples have been disposed of, and towards the end there was more money asked for the best Scotch, but there was not sufficient sales made to justify an advance in our quotations, but the demand was much better, and ready sales were effected of the best samples at the following prices.

York Reds	-	-	55s to 70s	Kent and Essex Whites	-	50s to 55s
Perth	-	-	50 —	— — Kidneys	-	— —
Yorkshire	-	-	— —	Wisbeach Kidneys	-	60 —
Early Devons	-	-	55 60	— Blues	-	60 —
Late Devons	-	-	— —	— Whites	-	45 50
Cornwall	-	-	55 60	Guernsey Blues	-	60 —

— Whites	-	-	— —	Prince Regents	-	50 60

HOPS, Friday, Nov. 8.

The Market for fine Sussex and Weald of Kent Hops keeps advancing, and is full 5*s* per cwt. dearer than last week.

The Duty is still estimated at 130,000*l.*

Pattenden & Smith, Hop-Factors.

SMITHFIELD, Monday, Nov. 4.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10	to 4s 0	Best Downs & Half-breds	3s	8	to 4s 0
Best Short Horns -	3	8	3 10	Best Long-wools - -	3	8	3 10
Second quality Beasts -	2	8	3 2	Ewes and second quality	3	0	3 6
Calves - - -	3	4	4 2	Pigs - - - -	3	4	4 0

Beasts, 4015; Sheep, 30,900; Calves, 98; Pigs, 369.

Our supply of Beasts is again very extensive, nor do we observe much improvement in the general quality. Trade is exceedingly dull, and although 4*s* is obtained for some of the choicest, many of fair quality realise only from 3*s* 8*d* to 3*s* 10*d*. The inferior kinds are very heavy on hand, and make very little money; indeed many are sold under our lowest quotations. The Dutch Beasts are arriving in very good condition, and give much satisfaction to the butcher. Sheep are rather more plentiful, and trade for them is a little worse; there is, however, very little difference in the best qualities, but the prices of last week are not so freely given, and in some instances are not obtained. We have a great many Ewes and middling Sheep in Market, which are very unsaleable. Although good Veal is not very plentiful, we cannot observe any improvement in the general trade. It is only the very choicest that make anything over 4*s* per 8lbs. Pork trade continues steady.

Friday, Nov. 8.

The arrival of fresh Beasts to this day's Market is not very considerable, but owing to the dullness of the dead Markets, and the still inferior quality of the supply, very little business is doing. Our best qualities make about the same price as on Monday, from 3*s* 8*d* to 4*s*; but some of the inferiors are sold at very low prices, for they range from 2*s* 4*d* to 3*s* 2*d*. Sheep are fewer in number, but the demand is very small indeed; trade is a shade worse than Monday. The best Downs, &c. hardly make 4*s*, and Long-wools rather over 3*s* 8*d*; Ewes, &c. 3*s* to 3*s* 4*d*. Veal trade is heavy; we cannot quote more than 4*s* for the very best. Pork at late rates.

Beasts, 759; Sheep, 3310; Calves, 217; Pigs, 270.

41, West Smithfield.

HAY.—Per Load of 36 Trusses.

Smithfield, Nov. 7.

		„ Inferior	— —		

COVENT GARDEN, Nov. 9.—There has been little variation in the prices of most articles during the week; but, in consequence of the unsettled state of the weather, trade has been dull. Of fruit there has been, generally speaking, a good supply; Pine-apples are good in quality, and quite sufficient for the demand. Grapes are also brought in considerable quantities; some good foreign sorts are in the market, and home grown varieties are likewise good and plentiful. Melons are scarce, as are also Plums; a few of the Late Imperatrice are, however, still to be met with, and there are a few Damsons, but they are now almost over. The principal dessert Pears are the Marie Louise, Crassane, and Jersey Chaumontel; among the latter there are some very fine specimens. Apples consist of the Ribston Pippins, Blenheim Orange, Court of Wick and the King of the Pippins, Quinces and Medlars are plentiful, and Nuts of all kinds are sufficient for the demand; Walnuts are somewhat dearer; Cucumbers appear to be nearly over. Of vegetables, Cauliflowers are scarcer, and in consequence, a little dearer. Cabbages, Broccoli, and Brussels Sprouts are well supplied and are of good quality. Some excellent samples of Celery are in the market, and abundance of Carrots and Turnips are offered. Endive, Lettuce, and other salading are likewise sufficient for the demand. Cut Flowers chiefly consist of Rondeletia speciosa, Bignonia venusta, Epiphyllum truncatum, Gloxinias, Heaths, Heliotropes, Cinerarias, Pelargoniums, Camellias, Chinese Primroses, Picotees, and Roses; the latter are very fine specimens.

FRUITS.

Pine Apple, per lb., 3*s* to 7*s* 6*d*
Grapes, Hothouse, p. lb., 1*s* 6*d* to 5*s*

Kingsford and Lay.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

LAVENDER-HILL NURSERY, WANDSWORTH-ROAD, NEAR LONDON.

During the present month, will be sold by Auction, unless previously disposed of by private contract, the valuable and healthy NURSERY STOCK of the late Mr. W. PAMPLIN, by order of the Executors, consisting of about Nine Acres of general NURSERY STOCK, particularly abounding in the Finest HARDY EVERGREENS, of all sizes; FRUIT TREES, SHRUBS, and PLANTS; Large and Small CAMELLIAS, an extensive Collection of FERNS (some of extreme rarity); Erection of Greenhouse, Garden Frames, and Lights; Garden Implements, Shop Fixtures, quantity of Vegetable and Flower Seeds of the present Harvest, including a half-cwt. of best White Spanish Onion, Early Cauliflower, &c. &c.

Due notice of particulars will be given in a future advertisement. Meanwhile, parties contemplating purchasing the **Leases of the Premises will be treated with at once, and may learn full particulars, and may inspect the Leases, on applying to Mr. W. J. LOAT, Clapham Common; or to Mr. W. PAMPLIN,** Bookseller, 45, Frith-street, Soho.

LAVENDER-HILL NURSERY, WANDSWORTH-ROAD.—IMPORTANT LEASEHOLD PROPERTY to be Disposed of, by order of the Executors of the late Mr. W. PAMPLIN, Nurseryman. These valuable Premises with extensive frontage, most beautifully and eligibly situated, and capable of much improvement, consist of the substantial DWELLING-HOUSE, in capital repair,—dining, drawing, and large sitting-rooms, five good bed-rooms, and large underground and other domestic offices; Stable, Lofts, Sheds, and other buildings; about NINE ACRES of LAND, occupied as Nursery Ground. The whole (well adapted for a moderate family, for a Nursery and Seedsman, or for scientific and experimental Agricultural purposes) will be sold by public Auction during the present month, unless previously disposed of by private Contract.

For particulars apply to Mr. W. J. LOAT, Clapham Common, or to Mr. W. PAMPLIN, Bookseller, 45, Frith-street, Soho.

TO MARKET GARDENERS.

TO BE LET AT EALING, Six Miles from London, a Capital MARKET GARDEN of 11 Acres, well stocked with Fruit-trees, &c., lately in the occupation of Mr. Samuel Knevett. There is a House, with Stable, and other conveniences on the premises. For particulars apply to Mr. GROVER, Builder and House Agent, near the Church, Ealing, Middlesex.

TO FARMERS, BRICKMAKERS, BARGEMASTERS, and Others.

TO BE SOLD, by PRIVATE CONTRACT, about 2000 Chaldron of CINDER ASHES, and about 2000 Loads MANURE, mixture of Nightsoil and Sweepings of the Paved Streets, &c. Lying on the Premises, Albion-street, Rotherhithe, Surrey.—Apply to Mr. THOS. AVERY, on the Premises.

N.B.—The Manure, &c. may be loaded into craft if required.

KNAP HILL AND BAGSHOT NURSERIES.

NOTICE.—The Business of these Nurseries, since the death of the late Michael Waterer, carried on in the name of H. and J. WATERER, is by mutual agreement divided. The KNAP HILL NURSERY will in future be carried on by HOSEA WATERER, and that at BAGSHOT by JOHN WATERER. It will, therefore, be of importance, to prevent confusion, that correspondents be particular in the address, and direct letters intended for the Knap Hill Nursery, to Hosea Waterer, Knap Hill, near Bagshot; and those for the Bagshot Nursery, John Waterer, Nurseryman, Bagshot, Surrey.—November 7. 1844.

GRASS FARM.—WANTED, to RENT, upon very Moderate Terms, within 30 miles of London and two of a Market-town, a RESIDENCE, in perfect repair; containing three or four Sitting and eight or nine Bed-rooms, together with the usual Domestic Offices, &c. There must be from 20 to 50 Acres of good sound Meadow-land adjoining, and the rent asked for them must accommodate itself to the altered state of the times.—Apply by letter, post paid, with full particulars, to F.R.C., Post-office, Waltham-cross, Herts.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c.

This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 16½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford Street. — Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & C have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower Stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5A, Hawley-road, Kentish Town.

MR. LAWES' MANURES.—Mixture for Wheat, 7*l.* per ton; Super-phosphate of Lime, 7*l.* per ton. To be had at the Factory, Deptford Creek, near London.

Super-phosphate of Lime, in a concentrated form, may also be procured at Messrs. WARNER'S, 28, Cornhill, in 7 lb. packets, price 1*s.*

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, Nov. 9, 1844.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE Attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset street, Fleet street, London.

DR. HALLETT'S DRY SOLUBLE FERTILIZER'S are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried things (see No. 33 of the *Gardeners' Chronicle*, &c.). 5 cwt. of either has been found equal to nearly 40 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10*l.* per ton, or 12*s.* per cwt.

DR. HALLETT'S CONCENTRATED LIQUID FERTILIZER is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1*s.* 6*d.*, and in bottles, six times the size, at 7*s.* 6*d.* Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Warner & Warner, 28, Cornhill; Hurst & M'Mullen, 6, Leadenhall-street; Winstanly, Poultry; Pace & Co., St. Peter's Alley. Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mr. Bland & Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seward, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. D. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace & Co. Dundee—Green and Co. Further respectable Agents wanted.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S

ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Buildings, Bunhill-row, London.

TANNER'S VITREOUS CLOTH, a SUBSTITUTE for GLASS for HORTICULTURAL PURPOSES.—The above recommends itself to the notice of Florists and Horticulturists, as producing effects superior to Glass, at a less expense. The support the Proprietor has received from very many highly respectable Florists encourages him to consider that his labours have not been misapplied in bringing before the public an article so generally required. Price of cloth, 7-8ths of a yard wide, thin, 2*s.* 6*d* per yard.; stout, 3*s.* 1 yard wide, 3*s.* 6*d.* Price of Fluid (for renewing the cloth after lengthened service), 4*s.* 6*d.* and 2*s.* 6*d.* per bottle. Manufactured only by N. W. TANNER, Chemist, Exeter: and Sold by Messrs. Butler and Muckley, Covent-garden, London; Mr. Cunningham, Paradise-street, Liverpool; Messrs. Lucombe and Pince, Exeter Nursery.

AGRICULTURAL DRAINING. — THE DERBY LEVEL.—The attention of persons Draining their land is directed to this efficient but simple Instrument, presumed to be all that can be required for the purpose, and its price such as to place it within the reach of all. To be had of the Maker,

J. DAVIS, Optician, Derby.

DRAIN TILES, SOLES, &c.—A regular supply can now be had, of various sizes, and at moderate prices, at AINSLIE'S PATENT DRAIN TILE WORKS, Alperton, near Ealing, Middlesex.

Alperton is eight miles west of Paddington, and about three miles from Acton, Ealing, and Harrow. The Works being on the banks of the Grand Junction Canal, Tiles, &c., can be barged at a cheap rate, to any distance on the line.

All communication to be addressed "Alperton Tile Works, near Acton, Middlesex."

DRAINING OF LAND.—THE WORKMAN'S LEVEL, invented by Mr. BAILEY DENTON, is made and sold by MESSRS. JONES, Opticians, 30, Lower Holborn, London.

IMPROVED ROOFING FELT.

M'KIBBIN'S PATENT ROOFING FELT is particularly applicable as a Substitute for Slate, Zinc, Tiles, Thatch, and other Articles used for Roofing, from its Economy, Durability, and Lightness. It is quite impervious to wet and damp, resists the heat of the sun, and is a non conductor of heat or cold. Besides the economy in repairs, the timber where it is used may be so light as to save its whole expense. It requires no other coating, and by attention to printed directions may be applied by a common labourer. It is free from breakage and contraction, like zinc, and requires neither painting nor coating. It is now in very general use for Roofing Houses, Verandahs, Sheds, Workshops, Ropewalks, Railway Stations, Icehouses, &c. &c., and for protecting Plants, covering Garden Frames, Corn, and Hay Ricks, the top and sides of Sheep-folds; and to Emigrants it provides a cheap, warm, durable, and portable Roof.

This Improved Roofing Felt is much more durable than the common Felt, made in lengths, not being subject, like it or other materials in continuous lengths, to be stripped by storm; and being fastened down at the overlaps only, the wet cannot percolate through the nail-holes.

Sold in sheets 32 inches by 20, at 5*d.* each (being less than 9*s.* 6*d.* per square of 100 feet).—Apply to H. C. BOWDEN, Agent to the Manufacturers, East India Chambers, Leadenhall-street, London.

AGRICULTURE, COMMERCE, NAVIGATION, the CHURCH.—A. B. SAVORY and SONS, GOLDSMITHS, 11, Cornhill, London, opposite the Bank, have finished a few Splendid Pieces of PLATE, suitable for Presentation to Gentlemen connected with either of the above pursuits or professions, to which they invite the attention of committees who are in search of valuable testimonials for such occasions.

THIS DAY IS PUBLISHED,

THE BOOK OF THE FARM; detailing the Labours of the Farmer, Farm Steward, Ploughman, Shepherd, Hedger, Cattle-man, Field-worker, and Dairymaid. By Henry Stephens, F.R.S.E. In three large volumes royal octavo, price 4*l.* 10*s.*, illustrated by 33 Engravings on Steel, and upwards of 600 on Wood.

Advertisement by the Publishers.—Before the publication of the Book of the Farm there was no Work to which the Student of Agriculture could be referred, as giving, in full detail, the various operations to which his attention would be directed in the course of the year. Such a work has long been a desideratum to the practical Farmer; and in the present volumes it has been the object of the Author to supply it. Commencing with the end of the Agricultural year, when the crops are reaped and housed, he leads out with what may be called the preparatory labours for the ensuing season; the reader being thus led on from month to month, and taught what labours should be in succession undertaken; why at that particular time; how these can be best performed, and with the smallest cost of money or time; and also the data by which the master may ascertain that his work has been efficiently performed. Nor has he confined only to the primary operations of the Farm that the Author has limited his instructions. Almost every concomitant range of subjects, which it should be the interest of the Farmer to know, has been brought forward and systematically discussed, and separate sections—we had almost said treatises—have been devoted to the mysteries necessary to be learned by the farm-builder, the weather-seer, the hedge-planter, the ditcher, the drainer, the plough-man, the sower, the thatcher, the shearer, the hay-maker, the pig-killer, the miller, and the butcher, up to the grieve or general overseer of the farming operations. In short, it has been the great object of the Author, while endeavouring to make his Work as comprehensive and perfect as possible, that no subject, either of primary importance or collateral interest to the Agricultural Student or practical Farmer, should be left undiscussed, and the utmost pains has been taken that the information given should be brought down to the latest and most approved discoveries in all the departments.

SUBJECTS TREATED OF IN "THE BOOK OF THE FARM."

Introductory.—The Difficulties which the young Farmer has to encounter at the outset of learning practical Husbandry—The Means of overcoming those Difficulties—The kind of Information to be found in existent Works on Agriculture—The Construction of "The Book of the Farm"—The existing methods of learning practical Husbandry—The establishment of Scientific Institutions of practical Agriculture—The Evils attendant on Landowners neglecting to learn practical Agriculture—Experimental Farms as places for instruction in Farming—A few Words to Young Farmers who intend Emigrating as Agricultural Settlers to the Colonies—The kind of Education best suited to Young Farmers—The different kinds of Farming—Choosing the kind of Farming—Selecting a Tutor Farmer for Teaching Farming—The Pupillage—Dealing with the Details of Farming—The Steading or Farmstead—The Farm-house—The Persons who Labour the Farm.

Winter.—The Weather in Winter—Climate—Observing and recording Facts—Soils and Subsoils—Enclosures and Shelter—The Planting of Thorn Hedges—The Plough—The various Modes of Ploughing Ridges—Draining—Yoking and Harnessing the Plough, and of Swing-trees—Ploughing Stubble and Leaguing—Fresh and Subsoil Ploughing, and Moor-land Paring—Drawing and Stowing Turnips, Mangold-Wurzel, Cabbages, Carrots, and Parsnips—The Feeding of Sheep on Turnips in Winter—Driving and Slaughtering Sheep—Rearing and Feeding Cattle on Turnips in Winter—Driving and Slaughtering Cattle—The Treatment of Farm-horses in Winter—Fattening, Driving, and Slaughtering Swine—The Treatment of Fowls in Winter—Threshing and Winnowing Grain, and of the Threshing-machine—The Wages of Farm-servants—Corn Markets—The Farm Smith, Joiner, and Saddler—The Forming of Dunghills, and of Liquid Manure Tanks—Winter Irrigation.

Spring.—Cows Calving, and Calves—The Advantages of having Field-work in a forward state—Cross-ploughing, Drilling, and Ribbing Land—Sowing Spring Wheat and Grass Seeds—Sowing Beans, Peas, Tares, Lucerne, Saintfoin, Flax, and Hemp—Switching, Pruning, and Water-Tabling Thorn Hedges—Hiring Farm Servants—Sowing Oat-seed—The Lambing of Ewes—The Training and Working the Shepherd's Dog—Sowing Barley Seed—Turning Dunghills and Composts—Planting Potatoes—Breaking in young Draught-horses—Sows Farrowing or Littering—The Hatching of Fowls.

Summer.—The Sowing of Turnips, Mangold-Wurzel, Rape, Carrots, and Parsnips—Repairing the Fences of Grass-fields, and the proper Construction of Field Gates—The Weaning of Calves, Bulls, and the Grazing of Cattle till Winter—Mares Foaling, Stallions, and Horses at Grass—Sheep-washing, Sheep-shearing, and Weaning of Lambs—Rolling the Fleece, and the Qualities of Wool—The Making of Butter and Cheese—Weeding Corn, Green Crops, Pastures, and Hedges, and Casualties to Plants—Haymaking—Summer Fallowing, and Liming the Soil—Building Stone Dykes—Embankments against Rivulets—Forming Water Meadows—Breaking in young Saddle-horses.

Autumn.—Pulling Flax and Hemp, and the Hop—Reaping Rye, Wheat, Barley, Oats, Beans, and Peas—Carrying in and Stacking Wheat, Barley, Oats, Beans, and Peas, and of the Construction of Carts—Drafting Ewes and Gimmers, Tupping Ewes, and Bathing and Smearing Sheep—Lifting and Pitting Potatoes—Sowing Autumn Wheat, and the Construction and Principles of Agricultural Wheel Carriages—Eggs—Rotation of Crops—Fertilising the Soil by means of Manures—The Points possessed by the Domesticated Animals most desirable for the Farmer to cultivate—Making Experiments on Farms—Destroying and Scaring Vermin on Farms—Looking at a Farm; its Rent; its Lease; its Stocking; the Capital required for it—Improving Waste Land—Farm Book-keeping—The Conveniences of the Cottages of Farm Servants—The Care to be bestowed on the Preservation of Implements—Index.

William Blackwood and Sons, Edinburgh and London; and Sold by all Booksellers.

SUBSCRIPTIONS

FOR THE

NATIONAL TESTIMONIAL

TO

Mr. ROWLAND HILL,

Author of the Penny Postage,

WILL CLOSE ON THE 30TH OF NOVEMBER.

Of all the sources of income stated in the recently published Quarterly Returns of the Public Revenue, none exhibit such a proportionate increase as the *Post Office*. On the year's net Revenue, the Customs have increased at the rate of only 1½ per cent., the Excise 1½ per cent., the Property Tax 2 per cent., while the *Post Office Revenue*, under its almost nominal rate of a penny, has increased above 13½ per cent., and the increase on the quarter has been even as much as 25 per cent.

These cheering results show that though the *plan of Penny Postage* is yet but *imperfectly tried*, the *complete restoration* of the Post Office Revenue to its amount before the Penny Postage was adopted is not an event far distant, if it be fairly and honestly carried out; and the *City of London Mercantile Committee on Postage* desire to impress these satisfactory results most emphatically upon the Public, in announcing the *approaching close* of the National Testimonial to Mr. Rowland Hill. *All* parties are unanimous upon the great *moral* and *commercial* advantages of the *Penny Postage*. Its expediency as a *financial* step has been the *sole* ground of question; but now, even this *can scarcely be doubted*; for, let it be remembered, that the Old Postage Revenue had been absolutely *stationary* for twenty years,—retrogressive, in fact, if we consider the increase of population, education, and commerce during the period. The change which Penny Postage has effected, is to make the *Post Office Revenue* the *most buoyant* source of National Income, bidding fair to become more profitable than it has ever been. The Committee, therefore, call upon the Public to reward, with suitable gratitude, the Author of this great and triumphant measure.

The Committee have the satisfaction to announce that the Subscriptions, headed by the chiefs of political parties and of commercial wealth, already reach 10,000*l.*; but 10,000*l.* cannot be held to be a sufficient *national* reward for such *national* services. The Committee therefore urge upon the *nation at least to double* this sum. If every letter-writer, for only a single week, would pay a twopenny instead of a penny rate for his letters, the amount, and more, would be raised. In proportion as the public show their gratitude to Mr. Hill, so they strengthen the chances for the complete adoption of his plan, *now but partially carried out*. Its perfection will bring greatly-increased convenience to themselves, and increased advantage to the Post Office Revenue.

Never have the services of any *Public Benefactor* been *requited* as Mr. Hill's have been. Quitting a *permanent* situation for a *temporary* public engagement, to carry out his plan, Mr. Hill's services, whilst his plan was yet not carried out, were dispensed with, and he received the following acknowledgments of his merits, and—*nothing more*:—

"I gladly avail myself," writes the present Chancellor of the Exchequer, "of the opportunity of expressing my sense of the satisfactory manner in which, during my tenure of office, you have discharged the several duties which have been from time to time committed to you." "I entertain," writes Sir Robert Peel (who has also subscribed 10*l.* to the Testimonial), "a due sense of the motives by which your conduct, in respect to Post-Office arrangements, has been actuated, and of the zeal and fidelity with which you have discharged the duties committed to you."—Mr. Trevelyan, on behalf of the Lords of the Treasury, writes thus:—"I am also commanded by their Lordships to take this opportunity of stating, that they consider it due to you, on the termination of your engagement with the Government, to express to you the approbation with which they have regarded your zealous exertions in the execution of the duties which have been intrusted to you; and how materially the efficiency of the Post Office arrangements has been promoted by the care and intelligence evinced by you in the consideration of the various important questions which have been referred to you."

Under these circumstances the Committee call upon the *Public* to come forward with due generosity, and reward Mr. Hill themselves, as the *unrequited Inventor* of the *great measure of Penny Postage*—a measure which has opened the blessings of free correspondence to the Teacher of Religion, the Man of Science and Literature, the Merchant and Trader, and the *whole British Family*, especially the *poorest* and most *defenceless* portion of it;—a measure which is the *greatest boon* conferred in modern times on *all the social interests* of the *civilised world*, for Penny Postage is spreading its influence throughout Europe and reaching even Russia. The Committee rely on the gratitude of their countrymen, and feel sure that this, their last appeal, will not be made in vain.

(Signed) GEO. LARPENT, Chairman.

Consulting Actuary—W. Ratray, Esq., King William-st., City.

THE GREATEST PRESENT BENEFIT, AND THE GREATEST FUTURE ADVANTAGES to those who attain the average duration of Life are secured to the Assured in this Office, *a combination of advantages presented by no other in London.*

The principle adopted in the distribution of the profits is *peculiar to this Office*, and is at once safe, equitable, and favourable to young and good lives. The surplus is reserved for Members who survive the period at which their premiums, with accumulated interest at 5 per cent., shall amount to the sums assured, and may be received in cash, or applied in the reduction of the future premiums, or to the increase of the sum assured.

The Premiums are deduced from the Government experience, and are accurately adjusted to the several ages. At early and middle life they are about *one-fourth lower than at most other offices.*

All the objects of Life Assurance may be effectually accomplished at this Office.

Every facility and information afforded on application at the Office, 17, New Bridge-street, Blackfriars.

CHARLES JAMES THICKE, Resident Secretary.

NORTH BRITISH INSURANCE COMPANY, Established 1809. His Grace the Duke of Sutherland, K.G., President; Sir Peter Laurie, Alderman, Chairman of the London Board; Francis Warden, Esq. (Director H.E.I.C.), Vice Chairman; John Webster, M.D., F.R.S., 24, Brook-street, Physician.

THIRD DIVISION OF PROFITS.

The Third Septennial Investigation of the Company's Affairs will take place on the 31st December next. Parties joining the Profit Scheme in the interim, will participate in the Bonus to be then declared.

This Institution is incorporated by Royal Charter, and is so constituted as to afford the Benefits of Life Assurance in their fullest extent to Policy Holders, combined with perfect security, in a fully subscribed Capital of One Million Sterling, besides an Accumulated Premium Fund, exceeding Four Hundred Thousand Pounds, and an Annual Revenue of Eighty-seven Thousand Pounds.

Fire Insurances may be effected on Private Houses, Country Mansions, &c., at the lowest rate of Premium.

A Prospectus, containing Tables of Premiums, with the names of the President, Vice Presidents, Directors, and Managers, who are all responsible Partners, may be obtained of Messrs. B. and M. BOYD, 4, New Bank Buildings, or of the Actuary, 10, Pall-Mall East. JOHN KING, Actuary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE 14, WATERLOO PLACE, PALL MALL, LONDON.

The Chisholm, *Chairman*. W. Morley, Esq., *Dep. Chairman*.

GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.

Credit given to Members for half the amount of the first five Annual Premiums, without security.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l.*, for One Year, Seven Years, and the whole Term of Life.

A. R. LAVINE, Managing Director.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON and Co., West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co." under a crown. Old articles replated and gilt.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS AND DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

CONTENTS of the NUMBER for SATURDAY last, NOVEMBER 2, OF

THE ATHENÆUM,

JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND THE FINE ARTS.

Twenty-four Large Quarto Pages, PRICE FOURPENCE, *Or Stamped, to go free by post, 5d.*

Reviews OF, WITH EXTRACTS FROM—

Dispatches and Letters of Lord Nelson, by Sir Harris Nicolas.	Factories and the Factory System, by W. Cooke Taylor, LL.D.
Travels in the Track of the Ten Thousand Greeks, by W. F. Ainsworth, Esq.	Life of the Rev. Andrew Bell, D.D., by Dr. Southey.
The Attaché; or, Sam Slick in England. Last Series.	Journal of William Dorosing, of Stratford.

WITH SHORTER NOTICES OF—

Gallus; or, Roman Scenes of the Time of Augustus, by Professor Becker. Translated by F. Metcalf.	Walks in the Country, by Lord Leigh.

Just Published,

AN ESSAY on the Latest Improvement on the Culture of Wheat Sowing, Drilling, &c.; also of Barley, Beans, Peas, Seeds, &c., (and for Gardeners and Nurserymen's purposes invaluable, as the land is cleared at much less expense from weeds, &c.), being a great saving in seed, producing greater crops, by adopting the new principle, and which is suitable to all soils. And a small model, with full instructions to make the same, at the cost of 1½*d.* to 15*s.* Gypsum for land, and for staying the ammonia, &c., in Manure Heaps, Stables, Cesspools, &c. &c., &c., supplied genuine, in any quantity, from the principal works in the United Kingdom, to suit the buyer's convenience, effected in 12 hours, will be forwarded, postage free, on receiving 1*s.* by letters prepaid, addressed to J. WOOLHOUSE, 3, Pepper-street, City of Chester.

GARDENING and FLORICULTURE.—In two handsome volumes, with 180 Illustrations, price 18*s.*, the GARDENER and PRACTICAL FLORIST, containing a complete system of cultivating, managing and improving Flowers, Plants, and Shrubs; plain instructions for raising new varieties; a clear description of the properties of Flowers, and a concise and familiar explanation of every subject connected with Gardens, Greenhouses, and Conservatories.

London: R. GROOMBRIDGE, 5, Paternoster-row, and all Booksellers.

News of the Week.

OUR accounts from Spain give the particulars of another conspiracy which has been detected in that unhappy country. The alleged object of this attempt was the assassination of General Narvaez and of his chief lieutenant, the Baron de Meer, now Captain-General of Catalonia. The plot is said to have been so arranged that the attempt should be made simultaneously at Barcelona and Madrid, but in both cases the assassins were unsuccessful. Gen. Narvaez was apprised of their intention and eluded the attack, while the Baron de Meer owed his escape to the indecision of the conspirators. Circumstances, however, have created an impression that the assassination of the Ministers was never contemplated, and that the affair was arranged by Gen. Narvaez himself, as a means of arresting certain suspected parties. The real facts probably will never be rescued from the darkness which surrounds the intrigues of Spanish politics, but the feelings of the Ministry have been shown by the arrest of Col. Prim and other parties supposed to have held treasonable correspondence with Espartero. Col. Prim is well known to have taken an active part in the overthrow of the Ex-Regent, but letters are said to have been found upon him, in which he expresses his regret at the part he had taken in upsetting the Government of Espartero, and bringing back the Moderados, seeing that the only use they had made of power was to destroy the constitution and liberties of the country. A Council of War had been summoned to try Col. Prim, and it was generally believed that his fate would be a counterpart of that of Diego Leon. The parties arrested at Barcelona have undergone a summary trial, and several have already been shot. The Chamber of Deputies have given a decisive proof that they will adopt the Ministerial scheme of constitutional reform, by rejecting the amendment of M. Isturitz, by a majority of 98; and have formally excluded Don Carlos and his family from all chance of reaching the throne by means of an alliance with the Queen.—From France we have no news of great importance. The affairs of Spain are the leading topic of the journals, and opinion is as much divided in Paris as it is in Madrid respecting the real character of the new conspiracy. The marriage of the Duc d'Aumale with the Princess of Salerno will take place at Naples on the 25th inst., the anniversary of the marriage of Louis-Philippe; and immediately after this event, the Prince and Princess de Joinville are to proceed to the Brazils, where they are to pass the winter, the health of the young Princess requiring a return to a milder climate.—The regular Overland Mail has arrived this week with later advices than those brought by the Calcutta steamer. The southern Mahratta country is in a disturbed state, and our troops have been compelled to attack the malcontents and dislodge them from some of the strong hill forts which they had seized. In Scinde tranquillity prevails, and the health of the troops is much improved; the Punjaub is still the scene of hopeless anarchy, and the interference of the British is again mentioned as the only means of restoring order. The news from China relates chiefly to the attacks of the Chinese mob on the American factories at Canton, and to the increase of piracy. The troops are again very sickly at Hong-Kong; and it is said that Mr. Davis, the new Plenipotentiary, has advised the abandonment of that settlement.

At home, we regret to notice the increase of fatal accidents, not only in mines, but in important buildings in our provincial towns. The late colliery accidents followed closely upon a long series of explosions in the engine-houses of factories, and this week we have accounts of another class of accidents, which seem to call as loudly for Legislative interference. Our provincial news records the fall of no less than six buildings, including a mill at Oldham, an archway at Derby, a portion of the new market at Birkenhead, and factory chimneys at Stockport, Manchester, and Glasgow, four of which were attended with a lamentable loss of life.

Home News.

COURT.—On Saturday the Queen and Prince Albert took equestrian exercise in the riding-school. On Sunday Her Majesty and the Prince walked for some time in the Home Park, and afterwards attended Divine service in the private chapel of the Castle. On Monday morning Her Majesty promenaded for some time in the Home Park, and in the afternoon took equestrian exercise with Prince Albert in the riding-school. On Tuesday, Wednesday, and Thursday, Her Majesty and the Prince took

their usual promenade in the grounds of the Castle. Prince Albert shot in the royal preserves at Bagshot on Monday, and in those of Windsor on Wednesday, and on Thursday hunted with his harriers. The Prince of Wales and the Princesses are quite well, and have taken their usual exercise on ponies during the week. Her Majesty and Prince Albert, according to the arrangements at present determined upon, will leave Windsor Castle on Tuesday next, the 12th inst., at an early hour, for Slough, proceeding thence, in the state carriage of the Great Western Railway to Paddington. From that terminus the Queen and Prince, attended by a military escort, will proceed to the Euston-square station, and thence, by a special train, to the Roade station, 60 miles from the metropolis, and about 40 miles from Burghley House, the seat of the Marquis of Exeter. At this station the royal carriages will be in attendance to convey Her Majesty, Prince Albert, and suite, to Burghley. Detachments of cavalry, relays being stationed at different points of the road throughout the whole line of route from the railway station to Stamford, will form Her Majesty's escort. Her Majesty is expected to arrive at Burghley between 4 and 5 o'clock in the afternoon. During the short absence of the Court from Windsor, which will not extend beyond four days, the infant royal family will remain at the Castle. The visitors to the Queen this week have been Prince Ernest of Hesse Philippsthal, the Duke and Duchess of Bedford, the Earl of Lincoln, the Earl and Countess of Clarendon, the Earls of Liverpool and Delawarr, Lord Portman, and Lord and Lady Ashley. The Earl of Morton has succeeded Lord Byron as Lord in waiting; Capt. Meynell has succeeded the Hon. Capt. Duncombe as Groom in waiting; and Col. Arbuthnot has succeeded Major-Gen. Wemyss as Equerry in waiting to the Queen; and Lieut.-Col. Wylde has succeeded Col. Bouverie as Equerry in waiting to Prince Albert. The Archbishop of York, Lord High Almoner to Her Majesty, has appointed Archdeacon Wilberforce to the office of Sub-Almoner, in the room of the late Dean of Carlisle.

Ministerial Changes.—A rumour is current that three offices in the Cabinet, all held at present by Peers, namely, those of the First Lord of the Admiralty, President of the Board of Control, and Postmaster-General, will all be vacated before the meeting of Parliament. Lord Haddington is expected to retire from the Admiralty on account of ill health, and Lord Ellenborough is mentioned as likely to be his successor. The Earl of Ripon it is said will also retire on account of ill-health from the Board of Control, and it is rumoured that Lord Stanley will succeed him as President of that Board, leaving the Colonies to Mr. Gladstone. In that case Mr. Gladstone will probably be succeeded at the Board of Trade by Lord Dalhousie, who will be succeeded, it is said, in the vice-presidency of that department by Mr. Cardwell, M. P., for Clitheroe. It is not known who is likely to succeed Lord Lowther as Postmaster-general.

Judicial Appointments.—Mr. Justice Erskine has retired from the bench in consequence of ill-health, and Mr. Erle, Q.C., has been appointed his successor.

Winter Assizes.—It having been finally decided to hold an additional gaol delivery at the following places, the Judges met on Tuesday, and made the following arrangement. The days for holding the Assizes have not been appointed:—Mr. Baron Alderson will preside at Winchester, Exeter, and Wells; Mr. Justice Patteson, at Nottingham, Derby, Leicester, and Warwick; Mr. Baron Gurney, at Liverpool and Chester; Mr. Justice Williams, at Norwich, Bury, Chelmsford, and Maidstone; Mr. Justice Coleridge, at York and Durham; Mr. Justice Coltman, at Stafford, Shrewsbury, Worcester, and Gloucester.

Death of Lord Western.—We regret to announce the death of Lord Western, which took place at Felix Hall, about 9 o'clock on Sunday morning. His Lordship, who was the son of Charles Western, Esq., of Riven-hall, by the daughter and heiress of William Borland, Esq., of London, was born in 1767; and after being educated at Eton and Cambridge, entered Parliament for Maldon, in 1790. He attached himself to the old Whig party, and continued to sit for Maldon till 1812, when he obtained a seat for the county, and remained in the House of Commons till 1832. During this long period of 42 years he took an active part in the business of the house, particularly on the corn-laws and the currency. If not the author, he was one of the leading promoters of the Corn Bill of 1815; and he ever remained a staunch advocate for protection, opposing as strenuously the proposed fixed duty of the Whigs as he did the doctrines of the League; and last year, on the formation of the Protection Society, he liberally contributed to its funds. With respect to the currency, he was opposed to the principles which have of late years been adopted. He attributed much of the embarrassment and distress which have prevailed at different periods to this cause, and endeavoured by his speeches and pamphlets to enforce his views on this subject. His Lordship steadily supported the Liberal party in their long struggle for reform; and contributed to its ultimate success in 1831; but the passing of the Reform Bill cost him his seat for Essex. On the division of the county under the provisions of that measure, he became a candidate for the northern division, but was defeated by Sir John Tyrell and Mr. Baring—a circumstance which induced Lord Melbourne, as a reward for his long and consistent services, to call him to the upper house, by the title of Baron Western, of Rivenhall; his political friends in the county also testified their esteem for him by presenting him with a splendid piece of plate, at a public dinner at the Shire-Hall, attended by 400 gentlemen. Since that period his Lordship lived in comparative retirement, seldom taking part in the debates of the House of Lords. A great portion of his time was devoted to practical improvements in farming; and in this department his name will long rank with those of the greatest benefactors of agriculture. His farm was a leading object with the agricultural tourist in the eastern part of the kingdom, as Felix Hall, filled with antiquities and works of art, principally collected in Italy, was attractive to the antiquary and the man of taste; and a welcome and ready hospitality was always extended to those who called to inspect either the farm or the mansion. Lord Western was never married, and the title is extinct.

Foreign.

FRANCE.—The state of Spain is the principal topic referred to in the Paris journals, which concur in considering the position of the actual Government of that country as, for the moment, strong enough to resist all the attacks directed against it. The Ministerial papers express the utmost horror at the conspiracies to assassinate General Narvaez and the other Spanish authorities, although the *National*, the *Siècle*, the *Commerce*, and most of the Opposition papers, admit that, from the accounts in their possession, the whole appears to be a plot got up by the police at the suggestion of the Government itself. An animated controversy on this subject has been kept up between the *National* and the *Journal des Débats*, the republican print violently attacking the Moderados and Queen Christina, whilst the Government organ cautiously defends the Narvaez Cabinet, but lavishes bitter invectives on Espartero, whom it accuses of having been sanguinary when prosperous, and of having fled like a coward from his enemies when they rose against him. This article of the *Débats*, in which the fallen Regent is abused, with little taste, for having been opposed to France, concludes by saying:—"Whether Spain change her constitution or not, Heaven preserve that noble land from falling again under the rule of Espartero. The best constitution is that which is now being carried into execution. Espartero would have promulgated a hundred constitutions without executing any of them." The *Patrie* of Thursday mentions that the Spanish Government has proposed to the Government of France the marriage of the Duke of Montpensier with the young Queen Isabella. With this proposition a memorial is said to have been sent, in which it is stated that it is impossible to arrange a marriage with the son of Don Carlos, on account of the opposition it would meet with in Spain; but that there would be no objection by any party to the marriage with the Duc de Montpensier. The *Patrie* adds that no answer has yet been sent to the proposition. The French Government has given the strictest orders to remove all Spanish emigrants from the south of France to the department of the Coté d'Or, where alone they are to be allowed to take up their residence. To such an extent is this carried, that some Spanish merchants, established in the south of France, have been obliged to break up their establishments, to their utter ruin.—It is stated that the loan of 300 millions will almost immediately be offered for competition (in the Three per Cents.), and that the minimum will be fixed at 80f. 10c. It is expected that the houses of Rothschild and Baring will be among the bidders. It is said that the adjudication will take place on the 25th inst.—It would appear from the Toulon papers that a certain *éclat* is to be given to the voyage of the future Duchess d'Aumale, from Naples to Toulon. Independent of a flotilla of steamers, the Prince de Joinville is to unite under his command the naval division now stationed before Tunis. Immediately after their marriage, the Duke and Duchess d'Aumale will take up their residence for a few months in the neighbourhood of Toulon. The Prince and Princess de Joinville are then to go to the Brazils, the health of the Princess requiring her removal to a milder climate.—The Committee charged with the reorganisation of the Polytechnic School have proposed the exclusion of 17 pupils from the institution, and the Ministry has sanctioned the measure. All the others are to be invited to re-enter the school and undergo the examination, agreeably to the ordinance of reorganisation.—The King left for Fontainbleau on Friday, accompanied by Count de Montalivet, and was to return to Paris on Sunday evening. His Majesty, it is said, intends to give *fêtes* in that splendid residence on the occasion of the marriage of the Duc d'Aumale.—At a general meeting of the proprietors of the Paris and Rouen Railroad, held in Paris last week, it was resolved that the proposed branches to Elbeuf and Louviers be carried into effect; that a new issue, to consist of 18,000 shares, be authorised; and that the dividend for the half-year just expired be 24f. 50c. per share.—The last accounts from Morocco state that Abd-el-Kader has refused the Emperor of Morocco to repair to Fez, and that he had taken refuge in the desert, with all the followers who had remained faithful to him.—It is announced that ten communes in the department of the Var, amongst which are Cannes, Cannes, La Gaude, and St. Laurent, have separated from the Church of Rome, and addressed a petition to the Chamber of Deputies in favour of religious liberty.—A subscription has been opened at Falaise for the erection of a statue of William the Conqueror, who was born in that town.—Amongst the prisoners for trial before the Court of Assizes, in November, is a man named Barbier, on a charge of breach of trust and theft. This, says the *Moniteur*, is the man who, under the name of Denis, gave strong evidence against Madame Lafarge.

SPAIN.—Accounts from Madrid announce that the lives of General Narvaez, and of his chief lieutenant, the Baron de Meer, have been attempted to be taken simultaneously in Madrid and in Barcelona. Narvaez, dining at the French Embassy on the 27th, was to have been assassinated. But the plot having been discovered, Narvaez instantly pointed out the party whom he suspected, by arresting the celebrated Colonel Prim. On the same day the Baron de Meer was attacked in the streets of Barcelona by assassins, who were arrested by the troops, but they were instantly rescued by a mob numbering 500 men. A fresh reinforcement, however, soon arrived, and 40 persons were arrested, six of whom, on the following morning, were condemned to death, and shot on the 29th, and nine sentenced to transportation. General Prim, on his arrest, was placed in solitary confinement, on a charge of high treason, and papers, it is said, were found on him giving a clue to a vast conspiracy, which had its ramifications in Barcelona, Saragossa, and other large towns. The object of the conspiracy, it is said, was not only the destruction of Narvaez and Baron de Meer, but the overthrow of the present system. A former Aide-de-Camp of Espartero, M. Mendicati, and several other persons of the Progresista party were taken into custody at the same time. In the Chamber of Deputies on the 28th, the debate upon the address in answer to the speech from the throne was opened, but it led to no incident of peculiar interest, beyond a question asked in reference to the attempt on the life of General Narvaez. M. Quinta having put some questions respecting the rumoured arrests, Gen. Narvaez said that the enemies of the Queen and the institutions, the partisans of Don Carlos as well as those of the revolution, had entered together into a conspiracy against public order, and were to begin in Madrid by a crime unworthy of the noble Spanish character. "The Government," he added, "is in possession of all their plans, and the delinquents now in the hands of justice will be speedily visited with the rigour of the law. The cause of order is in no danger, for the Government has both the wish and the power of maintaining it. As for me, nothing can induce me to swerve from the path of duty, and from the defence of the Queen and the liberty of my country. Providence has hitherto protected me, because it knows the rectitude of my intentions; but if I am doomed to fall by the hands of my enemies, I shall die contented, for my conscience will tell me that I have done everything in my power to uphold the throne and the institutions of the country. The banner of the Government is 'the law and the constitution.' Those who are anxious for their preservation must rally round it." This speech was repeatedly interrupted by applause from the assembly and the public galleries, and Gen. Concha, who had been hitherto opposed to him, M. Posada, and others, respectively expressed their firm determination to support the Government. Notwithstanding this, a strong feeling prevails in Madrid that the conspiracy was organised by the Government for the purpose of creating a panic and effecting the arrest and imprisonment of suspected parties. This belief is strengthened by the fact that the attack upon the Baron de Meer, at Barcelona, is mentioned in the Madrid letters, although that attack could not have been known at Madrid at the time when it is said to have taken place. On the 29th the Chamber of Deputies voted the first three paragraphs of the address in answer to the speech from the throne, after a confused and uninteresting discussion. The only subject of interest alluded to was the affair of the Spanish galliot, the Rayo, which was sunk a few weeks ago by the guns of Gibraltar. On this subject General Lara made some remarks, and called upon the Cabinet to exact complete satisfaction from the British Government for the insult offered to the Spanish flag. General Narvaez replied that a note upon the subject was to be sent by the Spanish Ambassador in London to the British Cabinet, and that Mr. Bulwer, the British Minister at Madrid, had assured the Spanish Government that full satisfaction would be given. Questions were put to the Government by M. Pacheco respecting some Spaniards who had been recently killed in Mexico, and also with regard to a declaration made by an English Minister in Parliament that the Spanish Government had published a decree against those carrying on the slave-trade in the West Indies. General Narvaez said that, while the Marquis de Viluma was in London, the British Cabinet had made some complaints on the extent to which the slave-trade was carried on; but the Marquis de Viluma added, that, as Minister representing Spain in London, he had declared to the British Government that measures would be taken to put an end to the slave-trade in the West Indies. The Chamber then proceeded to discuss the fourth paragraph, relative to the Government project of constitutional reform, together with the amendment of M. Isturitz, who moved that the consideration of that question should be adjourned to another session. M. Bravo Murillo defended the Government for bringing forward the project of reform at once. He reminded the assembly that no Minister who had held office during the last seven years had been able to govern within the limits of the constitution of 1837, and he contended that before setting the machine of Government in motion it was necessary to reconstruct it on a solid plan. The discussion was then adjourned to the 31st, when the Cortes adopted an amendment excluding Don Carlos and his children from any chance of an alliance with the Queen, and rejected the amendment of M. Isturitz for a postponement of the reform, by a majority of no less than 124 to 26.

PORTUGAL.—We have accounts from Lisbon to the 28th ult. The debates in the Chambers continue to absorb the chief attention. The discussions relative to

the Indemnity Bill have not yet been brought to a termination, but it is generally considered that the extraordinary acts of the Government during the last six months will be held as legalised, considering the urgency of the measures which gave rise to them, and that the Ministers will obtain in both Chambers a large majority. The recent financial speculation likewise forms a prominent part of the business of the present session, but the details have little interest for our readers. A meeting of the principal wine-growers of the Douro, has been held at the house of Mr. Forrester, a British merchant of Oporto, and an extensive cultivator of the vine in its vicinity. The statements made by this gentleman and others, were intended to point out the means of restoring the ancient character of Portuguese wines. The prevailing opinion that black, strong, and sweet wines are required for the English market; that it is not the genuine unadultered juice of the grape, but a mixture of brandy and wine with factitious taste and colour that suits the altered taste of the people of England, was shown to have led to a system of adulteration that had proved ruinous to the wine trade of Portugal. Efforts, it seems, were making to improve the quality of the wines of Oporto, and to discard the practice of drugging and brandying them. Mr. Forrester, who is deeply interested in the wine trade, and practically acquainted with it in all its branches, stated, that he knew of instances where the proportion of brandy to port wine is from three to five almudes to the pipe, which would be about a fourth-part of brandy, the quantity of berries unlimited, and the saccharine composition, "jeropigas," no less than a pipe to the wine-press reservoir. Vast quantities of this drugged wine, Mr. Forrester observed to the meeting, are in deposit in various British ports.

Belgium.—The Belgian Government have issued a Decree, in conformity with a Report of the Director-in-Chief of the railways, that in future a remission of 30 per cent. shall be allowed upon the low fares by third-class carriages, in favour of poor emigrants who may travel by railway to a Belgian port for embarkation, with another gratuitous carriage of their luggage besides. The privilege is restricted however to parties composed at least of 30 persons. This will be a great boon to the distressed Germans who flock to seek better fortune in the New World.

Germany.—It is asserted, in letters from Berlin, that Prince Charles, son of Prince Frederic Charles, born in 1828, is destined to the civil service of his country, and that it is the first time that a prince of the royal family does not follow the career of arms.—The Prussian Government had addressed an energetic remonstrance to the King of Hanover against the commercial treaty concluded by His Majesty with the British Government, and had recalled the Baron de Seckendorff, their ambassador at Hanover. The Prussian Government moreover expressed themselves in strong terms against the Anti-Germanic conduct of the King of Hanover.—The finding of the Judge of the First Instance against the regicide Tscheck has been modified by the Court of Appeal, in so far that, instead of being broken on the wheel, he is simply to be executed by the axe. An erroneous statement has been published in the German Papers, to the effect that when the sentence of death was read to the regicide, he quoted a sentence from the Bible, which he said he would recommend the King to read. It has been since discovered that this statement was a mere invention of a certain person named Dr. Joel Jacoby. It appears that Dr. Jacoby, who is a well-known Publicist, has been arrested, and ordered for trial.—From the Rhine we learn that a certain number of merchants in Mayence intend to transfer their business to Cologne. The laying of rails is almost completed on the railway, which is intended to unite the station of Cologne to the free port of that town, and that part of the railway will be open to the trade next spring.—The celebrated Bavarian sculptor, Schwanthaler, has just been presented by the Committee of the Goethe monument, at Frankfort, with a *cadeau* of 3000 florins, as a testimonial of their satisfaction at the masterly manner in which he executed the statue of Goëthe, as well as a token of their sense of his liberality in merely charging the outlay paid by him to his workmen, amounting to 2000 florins, without adding anything for his own time and labour. Schwanthaler has disposed of 2000 florins out of the donation for the benefit of the indigent in the city of Frankfort, and the remaining 1000 florins he distributed amongst his workmen.—It is officially announced that the reports recently circulated, to the effect that a jeweller at Dresden had sold false jewels to the King of Saxony are entirely without foundation, and it is stated in corroboration of this contradiction, that the jeweller alluded to has offered a reward of 300 dollars for the discovery of the author of the libel.—The *Augsburgh Gazette* announces that a duel took place lately between Count Bathiany and Count Zichy, in which the former received a sabre cut on the nose. Count Zichy had made some observations to Count Bathiany disapproving of the measures adopted by the Association of Young Hungary to insure the exclusive consumption of Hungarian produce. The Count having been incensed at these observations, challenged his adversary. In consequence of his meeting with Count Bathiany, Count Zichy received two fresh challenges from Counts Teleki and Pasmandi. It was believed that the police authorities would adopt measures to prevent such collisions. The 300th anniversary of the introduction of potatoes into Europe was celebrated a few days since at Munich.

Sweden and Denmark.—The King of Sweden has recently sent the Order of the Northern Star to the following distinguished writers:—Baron Alexander Humboldt, M. Arago, Herr Schelling, Herr Tieck, Herr Gauss, M. A. Lamartine, M. Victor Hugo, and M. de Tocqueville. His Majesty has conferred the highest order of knighthood in Sweden, the Seraphin, on the Kings of Holland and Bavaria. The republic of Venezuela have sent an ambassador to Stockholm to congratulate His Majesty on his accession.—We learn from Copenhagen, Oct. 21, that the King of Prussia had positively announced his intention of visiting that city towards the end of that month, or the beginning of November. After long and frequent debates, the Assembly of the States of Denmark rejected on the 20th ult., by a majority of 36 to 29, the motion made by the Opposition of an address to the King. This vote is a check to the Opposition, which hoped to gain a decisive triumph.

Italy.—Accounts from Rome state that the Papal Government is said to be in contract with the house of Rothschild for a new loan of 2,000,000 scudi. It is well known that the Holy See has lately opened a negotiation with an agent of the Duke de Leuchtenberg for his domains in the environs of Ancona, for which purchase a large portion of the loan is destined; but the parties have not yet come to an agreement as to the price.—The *Augsburg Gazette* of the 30th ult. states, that the object of the King of Naples' visit to Calabria was to observe with his own eyes the state of affairs in that province. His Majesty, during his journey, received many complaints of abuses which he has determined to remedy. Many patriotic voices were raised, and even the word "Constitution" was pronounced. It appears that the best results have been produced by the King's journey, and that the Government is determined to relieve the condition of the labouring classes.

Malta.—Letters from Valletta of the 27th ult. state that the new church of St. Paul, founded by the Queen Dowager, was to be consecrated on the 1st inst. by the Bishop of Gibraltar. The only portion yet incomplete is the spire or belfry, which will be finished by the 1st of the new year. The church is magnificent in its construction, though very simple. There are no pews, except for the Governor and Admirals, but high-backed benches, well cushioned, having carpets laid down between them, and hassocks for the convenience of the devout. There is also a splendid organ; but what is of most importance is, that the construction is such that the slightest intonation of voice will be heard from one end to the other. A beautiful statue of Faith, presented by Lord Howe, who was in Her Majesty's suite, has been refused a place in or outside of the church, on the plea of its resembling too much a Catholic custom. It has since been presented to the Garrison Library.

Turkey.—Accounts from Constantinople of the 17th ult. mention the arrival of a Tartar with despatches from the General-in-Chief of the Turkish army in Albania, announcing that he had entered the town of Dibra, after an engagement with the insurgents.—The *Augsburgh Gazette* publishes the following extract from a letter, dated Constantinople, the 2d ult.:—"There formerly existed a Turkish cemetery on the spot where the houses were built which were destroyed during the late fire at Pera. It is pretended that a Turkish saint was buried there. The Turks sold the ground at a very dear rate to the Christians. For some time back the site of the elegant houses erected on this ground excited the fanaticism of the Mussulman population. Recently, whilst digging a foundation, a Turkish tumulary stone was discovered. The female portion of the population immediately congregated, and cast stones at the windows of the houses, uttering at the same time the most dreadful menaces and blasphemies. These menaces have been realised by an incendiary fire. The first house burnt was built on the site of an ancient mosque." The same journal states that the Servian Government had applied to the Austrian Cabinet to remove Prince Milosch from Vienna, and to compel him to reside in a province where he would have less communication with Servia than in that capital. The most perfect tranquillity continued to prevail in Servia.—A letter from Rome of the 16th ult. informs us that the Metropolitan Bishop of Syria has entreated the Austrian Government to use its influence with the Porte in favour of the Christians of the Lebanon, in order that they may be treated with more justice and humanity.

Greece.—We have accounts from Athens of the 20th ult. The National Assembly was still occupied in examining the returns of members, a tedious process under a newly-formed constitution. One of the questions brought before the Assembly was, whether M. Balbi, as a minister of the Crown, came within the category of functionary. It required a long debate to settle the question, but ultimately it was decided that M. Balbi was subject to re-election. It appears to be doubtful if he will be continued in the Cabinet, a difference having arisen between him and his colleagues. The election of M. Tricoupi as vice-president of the senate, was considered a severe blow to the Ministry. The King and Queen were still absent from the capital. Their Majesties had been everywhere enthusiastically received.

Cape of Good Hope.—Cape papers to the end of August have arrived, according to which the frontier Boers were complaining of the inadequacy of protection, and the repeated infringements of the Caffres, notwithstanding the treaties entered into with the local Government. The Dutch farmers, it would appear, lay much of the blame arising from aboriginal aggression to the ready access the natives have had to fire-arms and ammunition in the way of trade with the British, and they seemed to consider that the Boers have been misrepresented here as persons who were only desirous of exterminating the original possessors of the soil for their own exclusive advantage. A meeting had been held of the Dutch farmers on the frontier, at which these feelings were strongly expressed, the late murder of one or two of their number having called them together to give their opinion on the subject. An active investigation was being made into the circumstances of these atrocities, and the Lieutenant-Governor had so disposed his military force in the neighbourhood as to command the movements of the tribes within a certain distance of the frontier, and trace the guilty parties if they were within the range of his district. The Boers are described as having attended the meeting well armed, and several of them came from a great distance to be present at the debate. In other respects the news by this arrival is of no great importance. From Natal the advices are favourable, and the progress of affairs in that part of Africa are stated to be of the most satisfactory description. Capt. Smith was to be presented with a valuable sword as the reward for his exertions in that part of the country. The trading prospects of the Cape are alluded to as steadily increasing, and those of Algoa Bay present a remarkable feature in the business of the colony.

India and China.—The regular Overland Mail has arrived this week with later accounts than those brought last week by the Calcutta steamer. The chief intelligence relates to disturbances in the southern Mahratta country, which has been some time in an unsettled state. Some of the malcontents seized two of the strong hill forts, where they hoisted the standard of revolt against the Rajah of Kholapore. They consist chiefly of Arab troops, who placed themselves under some bold leaders, and bade defiance to the Rajah and his allies. A force was sent by the British authorities to disperse them. It consisted of 50 artillerymen, and troops, amounting to about 1200 men, under the command of Colonel Wallace, of the Madras army. An attack is said to have taken place on one of the forts, in which the rebels defended themselves stoutly with their long guns. Some soldiers were wounded on the side of the British, for the hill forts from their position are difficult of access. The British were subsequently firing and throwing shells into the first fort, which is situate about 25 miles from Belgaum; the other is 18 miles further off. The Bombay Government was on the alert in making arrangements for having its disposable regiments ready for any emergency that might arise. Lieut.-Colonel Wyllie, of the Bombay Infantry, who had taken his passage by the steamer, was ordered to stop and join his regiment; and the steamers were in Bombay harbour under orders to be ready to remove troops at a moment's notice. Nothing serious was apprehended, but the Government were preparing to meet every difficulty. Serious riots took place at Surat on the 29th August, in consequence of the popular dissatisfaction at the increase of the salt-tax from half a rupee to one rupee (2s.) per maund of 80 lbs. Troops were promptly sent there by the Government, and the disturbances ceased. The Supreme Government subsequently ordered, by virtue of instructions from the Court of Directors, that the increased duty should be in the Bombay Presidency only of the sum of one quarter of a rupee (*6d.*) per maund. This arrangement has apparently pacified the people, although there were petitions presented against the tax. In Scinde tranquillity prevailed, and the health of the troops, with the exception of Sukkur and Shikarpore, was very good. The climate in September was highly agreeable, and many of the prejudices excited against the possession of the Indus had vanished. It was even reported that there was an intention of making it an integral part of the Bombay Presidency, and of increasing the Bombay Army so as to be able to maintain the British rule in Scinde. Capt. Mackenzie, at the head of some cavalry, in pursuing the Beloochee robbers, came on a body of armed men said to be Ryots, who had gone out to attack the Beloochees. His cavalry cut them to pieces, leaving 200 dead on the field. Captain Mackenzie has received the marked approbation of General Hunter for this exploit, although some doubt is expressed on the policy of undertaking the expedition. In the Punjaub confusion and anarchy prevailed. Heera Singh governs at Lahore, in the name of the young Maharajah Dhuleep. He was engaged in collecting a force to combat with his own uncle, Ghoolab Singh, and with the widow of Suchet Singh, the brother of Ghoolab, who was anxious to punish Heera for the murder of her gallant husband, Suchet Singh. There appears to be an apprehension on the British frontiers that some of those conflicting parties will enter the British territory, or that of the protected Sikhs, our allies, where the interference of the British Indian army will become imperative. It was rumoured that Sir H. Hardinge would soon proceed to the north-west, in order to confer with the Commander-in-Chief, who was at Simla, and perhaps even with Sir C. Napier, the Governor of Scinde. The affairs of Affghanistan present stormy appearances. Several powerful chiefs had formed an alliance with the King of Bokhara, with the intent of overthrowing Dost Mahomed, and a portion of their large army had fallen upon Bameean, defeating a son of the Dost, who shortly after regained the day. Yar Mahomed is now said to have defeated the Persian army brought against him, and prevailed on the Dost to accede to a second alliance between their families. The new rulers at Gwalior, although appointed under the British, are busied in peculations, and in oppressing the Ryots and Zemindars subject to them. The object of those rulers being to gather money as soon as they can, they care not about the means they use for that purpose. It was thought that the British authorities would have to compel them

to adopt another course. The unfortunate Christians who were formerly employed by the Gwalior Government, having been turned adrift, were in great distress, and a subscription had been raised for their relief, under the protection of the Lieut.-Governor of the North-Western provinces. The chief subject of interest at Bombay was, the arrest of the notorious Aloo Paroo, a very wealthy Hindoo, who is said to be deeply implicated in the late ship-burnings in the harbour, and one of the heads of the celebrated Bundor gang. His trial was fixed for the 7th October. He had been arrested at Jinjeera, a small island 80 miles south of Bombay, where he had concealed for some months, but was surrendered by the Rajah on the requisition of the Bombay Government. The advantages of steamers being fully recognised at Bombay, several companies had started for building steam-vessels for the coasting trade, &c.—The news from China comes down to August 1, but contains little of any interest. Several disturbances had lately been occasioned by attacks on the American factories at Canton, but these were headed by the very lowest of the Chinese. Robbery and piracy were still prevalent to a great extent, but, despite the efforts of the authorities, it seemed next to impossible to prevent their recurrence, and business remained exceedingly dull. Private letters state that the health of the troops is very melancholy. The 98th had 260 men in hospital on the 30th July. It was understood that Mr. Davis had written home recommending the abandonment of Hong-Kong; and that if the prevailing sickness continues, the Commander-in-Chief had resolved to send the whole of the troops to sea. An English vessel, the Samarang, had been fired into by a French man-of-war, but no particulars are given.

CITY.

Money Market, Friday. — Consols closed at 100⅜; Red. Three per Cents., 99⅜; New Three and a Half per Cents., 102¼ to ⅜; Bank Stock, 205; Exchequer Bills, 64 to 66 prem.

GAZETTE OF THE WEEK—BANKRUPTS.—J. Clark, Brunswick-cottage, City-road, carman—G. B. and A. J. Rudge, Gloucester street, Curtain-road, japan leather manufacturers—R. Eaton, Featherstone-street, City road, butcher—J. Staples, Cottenham, Cambridgeshire, plumber—J. B. Pim, Tweed's-court, Great Trinity-lane, stationer—W. Hobbein, Upper Seymour-street, flour dealer—H. Bryce, Montague close, Southwark, bottle merchant—W. H. Fitzhugh and R. F. Walker, Liverpool, merchants—M. I. Jacobs, Ashton-under-line, tailor—T. Crossfield, sen., Kirkham, Lancashire, linen-draper—J. Clarke, jun., Coventry, victualler—J. Raper, Bridge-road, Lambeth, tailor—H. J. Dobson, Camden terrace west, Camden Town, wine merchant—W. Ebbey, Abergavenny, City, silk manufacturer—F. E. Blythe, Colchester, Essex, porter merchant—J. Hubbard, Ramsgate, auctioneer—J. Pagrum, Robert-street, North Brixton, carpenter—J. Maynard, Panton street, Haymarket, bookseller—T. Swift, Rotherfield-street, Islington, and J. A. Hensman, Margate, bill brokers—S. Makepeace, Mitcham, Surrey, silk, cotton, and woollen printer—W. Brookes, Gilbert street, Grosvenor square, grocer—J. Row, Torrington, Devonshire, chemist—J. L. Tabberner, Birmingham, auctioneer—J. Bridrick, jun., Durham, bookseller—G. Bark, Birmingham, horse dealer—H. G. Gibson, late of Great St. Helen's, Bishopsgate street, but now of Northaw, near Potter's bar, Hertford, wine merchant.

Metropolis and its Vicinity.

The Royal Exchange.—Some confusion is said to prevail as to the real extent and capacity of the chimes of the clock at the Royal Exchange. The Gresham Committee at first ordered a peal of eight in the key of E flat; but Professor Taylor having afterwards been consulted on the subject, recommended an approximation to the chimes in Flanders, whereby a large extension of the scale, with the intervening semitones, harmony and the power of modulation are obtained. The committee on this suggestion increased their order to 15 bells—that is 12 in the scale of E flat (extending to B flat above), with the addition of two A natural, and 1 D flat, thus giving the command of the three keys of E flat, B flat, and A flat. Four tunes were arranged, so that they might be played with accompanying harmony by Mr. Dent's machinery; but the imperfect intonation of the bells above the first octave converted this intended harmony into discord. Until this imperfection is removed, it is proposed only to use the bells which are correctly tuned, and proper melodies have been prepared for them. Sir J. Graham has addressed the following letter to the Lord Mayor, dated Oct. 30:—"I have received Her Majesty's commands to make known to your Lordship and the Gresham Committee, and to the civic authorities charged with the arrangements for the reception of Her Majesty at the Royal Exchange on Monday last, the gratification which Her Majesty and the Prince, her Royal Consort, experienced on that day. The loyalty of the assembled multitudes, the splendid hospitality of the City of London, the order and good feeling which universally prevailed, have left on the minds of Her Majesty and of the Prince the most pleasing impression; and I am commanded to convey this assurance to your Lordship in the name of the Queen and of the Prince."

The Lord Mayor Elect.—On Saturday, pursuant to the usual custom, the Lord Mayor elect was presented by the present Lord Mayor, Sir W. Magnay, Bart., to the Lord Chancellor, for Her Majesty's approval. The ceremony took place at the Lord Chancellor's private residence, in George-street, Hanover-square. The Sheriffs, Recorder, Chamberlain, several Aldermen, and most of the civic officers were present. The Recorder addressed his Lordship, announcing that the citizens had "almost unanimously" elected Alderman Gibbs to the office of Chief Magistrate for the year ensuing. The Recorder then went into a history of the Alderman's civic career, the various offices which he had filled, and the ability he had displayed in them. He concluded by observing that the Lord Mayor elect "was in every way qualified to perform the duties of Chief Magistrate of the City of London, and he thought that those duties would be performed in a manner equal to any of his predecessors, and perhaps never surpassed. In the execution of his high functions, Mr. Alderman Gibbs, he was convinced, would show his loyalty to the Crown, and he was also equally certain that the Lord Mayor elect would be faithful to his fellow-citizens." The Lord Chancellor said, "My Lord Mayor elect, I have great pleasure in congratulating you on your appointment to the high office of Lord Mayor of London. It is an office of great importance and dignity, and one which I have no doubt will be fully sustained in your hands. And I have the satisfaction of stating to you and those assembled, that Her Majesty fully approves and confirms the choice the Livery of London have made in the election of Chief Magistrate for the year ensuing." His Lordship then, in a most friendly manner, shook hands with the Lord Mayor elect, and the other civic functionaries. The whole ceremony did not occupy half an hour. The Lord Mayor elect entertained the Aldermen, Sheriffs, and principal city officers, at the London Tavern in the evening.—The Lord Mayor elect has published a statement in the daily papers, for the purpose of explaining that his absence from the State procession, on the opening of the Royal Exchange, did not arise from any unwillingness on his part to meet the citizens, but from respect to the opinions of the Lord Mayor, who apprehended some expression of popular feeling which might be disagreeable to Her Majesty, and therefore requested Mr. Gibbs not to place himself in a position to call it forth. This day (Saturday) being Lord Mayor's day, the usual procession, on the installation of Alderman Gibbs, will take place from Guildhall to Westminster. It has been announced in the *Times*, that 100*l.* worth of rotten eggs have been purchased at Portsmouth and other places for the occasion; but it is believed that the authorities will take effectual measures to prevent such an outrage as would seem to be contemplated by the parties who have made this purchase. The installation-dinner will take place this evening at the Mansion House, and several of the Cabinet Ministers and Judges are expected to be present.

Royal Academy.—On Monday a General Assembly of the Academicians was held in Trafalgar-square, when Mr. William Dyce and Mr. William Calder Marshall were elected Associates of this Institution.

The Admiralty Telegraph.—It having been found that the steeple of the church erecting by the Marquis of Westminster on his Pimlico estate, at the corner of the new Chester-square, and Elizabeth-street, will be exactly in the line of view between the telegraphs at the Admiralty and the Royal Military Asylum at Chelsea, which continues to Wanstead-heath and Portsmouth, and will prevent their working; the authorities have given permission for the telegraph to be removed from the Asylum to the Royal Hospital, which will do away with the difficulty, and answer the purpose equally well. The conditions upon which the removal has been sanctioned by the Admiralty are, that the Marquis is to bear the expense of removing the telegraph and the extensive machinery, and re-erecting it in its appointed position.

Repeal of the Malt Tax.—On Tuesday the Committee of the Association for the Repeal of the Malt-tax met at the York Hotel, Blackfriars. The object of the meeting was chiefly for the purpose of arranging the details of their future proceedings, and was consequently of a private character. It is, however, understood that they have established a system of appeal to the farmers in every parish, and that from the answers which they have already received to the letters addressed to the principal agriculturists, they are encouraged to believe that a very powerful and active agricultural organisation will shortly be completed to obtain the repeal of the malt-tax. It has been resolved to hold a general meeting at the Freemasons' Tavern on the 13th December, and in the meantime it is expected that a variety of local meetings will be held in all parts of the country. The Committee, it is said, is resolved to bring the question before Parliament at the beginning of the ensuing session.

Destitution in the Metropolis.—A meeting of the Directors and Guardians of the Poor of Marylebone was held on Friday, at which a long discussion arose on the case of the poor man Hall, the particulars of which were given in our last. The subject was brought forward by Mr. Potter, who gave notice that he should at the next meeting move that the assistant-overseer and inspector of the out-door poor be brought before the Board to explain their conduct in the case relating to the death of John Hall, and that in the event of such explanation not being satisfactory, they be visited with the marked displeasure of the Board.—Mr. Wakley held another inquest on Friday on the body of a child who died from want and exposure to the cold. The mother said the child was taken suddenly ill and died in five hours. Her husband had formerly been a boot-maker, but nearly lost his sight by scarlet fever, and now swept a crossing in Queen-square. Her husband's parish was Bray, in Berkshire, and she was told, on applying for relief to the parish of St. Andrew's, Holborn and St. George the Martyr, about six months ago, that if she applied again she would be passed to her parish. She would not apply again, and they were in great destitution, her husband earning about 3*s.* a week, she being obliged to sell matches, taking three young children she had out with her. They lived in a room 10 feet by 8, and did not apply to the parish surgeon because they would thereby become chargeable to the husband's parish and be sent home. The Coroner said that the unwillingness now shown by the poor to apply for relief was attributable to their fear of being sent back to places where they had no longer any friends, and strongly condemned the law of settlement. The jury concurred in this opinion, and returned a verdict of Natural Death.

City of London School.—A Court of Common Council was held on Thursday, at which Mr. Hale, the chairman of the City of London School Committee, brought up a report on the subject of the school, which was received with the warmest applause. It stated that H. B. Hanbury Beaufoy, Esq., of South Lambeth, son of the late Colonel Beaufoy, has invested in the public funds, in the names of certain trustees, a sum of money sufficient to produce as dividends the yearly sum of 50*l.*, to be applied to the perpetual support of a mathematical scholarship to be called the Beaufoy Scholarship, to be established in connection with the City of London School, and to be enjoyed by pupils proceeding thence to the University of Cambridge.

Victoria Park.—The contract for 3 miles of park-paling has been retaken by a Mr. Marshall, its execution having been thrown up by Mr. Hull, of Godalming, who had previously taken it on terms of 1500*l.* below the highest tender. Workmen are engaged in forming Old Ford-lane into a straight line of road, and a row of houses, called King's Arms-row, has been levelled. Within the last three weeks upwards of 700 loads of rubbish have been brought from the works in progress in the formation of the new road at Whitechapel, to fill up the excavations. A circle has been staked out in the Grove-road, which is to form one of the principal entrances into the park; and some progress has already been made in the drainage of many of the fields. The chief part of the tenants inhabiting the houses forming the remaining wing of Bonner's-hall have vacated their occupancy, prior to the demolition of the building, which will commence at once. This is one of the most picturesque parts of the locality, the venerable trees which still remain showing it to have been the remnants of a formerly well-cultivated park.

The Fog.—A true November fog visited London on Tuesday, and was so dense that persons requiring light were obliged to burn candles or gas. On the river its effects were severely felt. The speed of the steam-boats was much reduced, and to prevent collisions it was necessary to hang out lights and keep constant watch, but no precautions could prevent great confusion and delay at the various wharfs and piers. It was necessary also to drive along the public roads with the greatest care.

Baths and Wash-houses for the Labouring Classes.—We have the pleasure of stating that the Queen has sent 200*l.*, the Queen Dowager 100*l.*, and Prince Albert 100*l.*, in aid of the funds required. The Grocers' Company have also presented 100*l.* The poor are already anxiously inquiring at the office in Crosby-square when the wash-houses will be opened.

Distress of the Jews at Mogador.—During the bombardment of Mogador, the Jewish quarter was subjected to the most brutal outrages, and the inhabitants plundered of all their property by the Moors and Kabyles. Since that period they have been wandering about in a state of the utmost destitution, and not a few have perished from starvation. A subscription has been set on foot in London for the purpose of providing for their immediate wants, headed by Messrs. Rothschild, of London, Frankfort, Vienna, Naples, and Paris, who have contributed 500*l.* to the fund. Sir Moses Montefiore, Mr. Goodale, and Messrs. Bensusan, have contributed 50*l.* each. The subscriptions already amount to about 800*l.*

Camberwell Church.—The consecration of the new church at Camberwell, which has been erected from the designs of Messrs. Scott and Moffatt, of Spring-gardens, on the site of the one destroyed by fire in 1841, is expected to take place on Thursday, and active preparations are making for that purpose. This ceremony was to have been performed by the Bishop of Winchester in the middle of last month, but it has been deemed advisable to remove the pulpit to another part of the church. The peal of bells, ten in number, and of very large size, have already been placed in the belfry. The organ has also been erected, and the interior fittings are almost wholly completed. It is expected that the Bishop of Winchester will consecrate Camden Chapel on the same day.

General Post Office.—On Saturday evening there was one of the largest despatches of newspapers from the Post-office in St. Martin's-le-Grand which has occurred for some years. So great a glut of newspapers has not been known in the General Post-office since the night of the coronation of Her Majesty, upon which occasion it is estimated that at least 130,000 newspapers were posted. The number on Saturday evening last did not fall far short of that quantity.

Metropolitan Improvements.—The new street from Oxford-street to Holborn is rapidly approaching that state when public proposals will be offered by the Commissioners of Woods and Forests for the erection of houses on either side of the road. The whole of the vaults are formed for the several buildings, a spacious sewer, about 2000 feet in length, has been constructed the entire extent of the roadway, joining the one in Holborn, and the great sewer in Tottenham-court-road; the gas-pipes are nearly all laid down, and it is expected that in the course of a week or two the water-pipes will be placed in the ground, as surveyors have taken a measure of the distance for that purpose. The foot-paths are marked out, and there are now regular thorough-fares for foot-passengers between Holborn and Oxford-street. At the south end of Plumtree-street the Commissioners have given instructions for the erection of three large houses, from designs by Mr. Pennethorne, the architect, which are to be specimens from which those in the line are to be raised. They will be in the Elizabethan style, composed of Bath stone and brick.

Accidents.—During the storm which prevailed in the metropolis and its vicinity on Friday night, the pole which supported the canvas covering of a circus, where equestrian performances are now exhibiting at Hackney, fell down while the people were assembling, and killed a woman and a child. It was at first supposed that the ropes had been wilfully cut, but after full investigation the jury returned a verdict of Accidental Death.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Nov. 2; West Districts, 123; Northern, 160; Central, 211: Eastern, 207; Southern, 265; Total, 966. Weekly average for the last five years, 946.

Provincial News.

The Late Storm.—The accounts from the provinces are filled with details of the severe storm which prevailed very generally throughout the country, and along the coast, from Thursday to Saturday last. Reports received at Lloyd's from various quarters give distressing accounts of losses at sea, with deplorable loss of life. Their number, we regret to say, is very considerable, and the sacrifice of property is enormous. The effects of the storm, however, were not confined to the shipping. At Birkenhead a portion of the new market now erecting there was blown down, and at Manchester the large chimney belonging to Messrs. Tennents and Clow, chemical manufacturers, was so much damaged that it fell and buried some of the surrounding buildings in the ruins. On the high lands in the North the storm was severely felt. On Cross Fell, in Cumberland, several persons, on crossing that dreary pass, were obliged to fall down on their hands and knees, for fear of being blown down the steeps of the mountain. The postman of the mail between Penrith and Alston was several times nearly blown out of his gig, and in the most bleak parts he was obliged to walk, holding on by the vehicle. The storm was not confined to this mountainous district alone, but extended over all the eastern division of Cumberland, by which the young Wheat crops in light soils and exposed situations have suffered much, the tender blades being swept away by the violence of the wind. The wind in those parts was accompanied with little or no rain.

Calne.—A few days since a meeting of labourers and others was held in the Methodist Chapel, Clack, in the parish of Lyneham, near this town, for the purpose of giving the labourers an opportunity of making known their distressed condition, and to consult as to the remedy. Long before the hour of meeting the chapel, which is large, was densely filled, and numbers were unable to obtain admittance. A working man from Calne having been called to the chair, opened the meeting by stating that it was a subject of painful regret that circumstances should render such a meeting necessary, yet he was cheered by the reflection that, whilst the labourers in some of the agricultural districts had wickedly proclaimed their distress by incendiary fires, the working classes in Wiltshire had recourse to other and constitutional means, viz., the holding of meetings of this description, and there stating their grievances, and respectfully asking for the removal of the causes which they believed had produced them. He then said, that as the meeting was convened for the purpose of giving the distressed labourers an opportunity of stating their own case, in their own way, he should be glad to hear the statements any of them might be disposed to make. At this suggestion seven men in succession came forward, and stated that 7*s.* per week was their wages when fully employed, which was not the case with all; that their families were large—four, five, and even six children to live upon it; that they were suffering much, their wages not being sufficient to obtain the common necessaries of life; that they were now reduced to a state of great wretchedness, and that their prospects for the future were even worse, unless a change soon took place. They fully believed their employers were unable to find them more employment, or to give them higher wages than at present; and said that the tailor, the shoemaker, and other small tradesmen depending on them, were in a condition nearly, or quite, as bad as themselves. They all expressed a belief that the extension of the allotment system would improve their condition. The following resolution was then proposed and carried unanimously:—"That, in the opinion of this meeting, it is highly desirable that an humble address be signed by the working classes in Wilts, and presented to the Queen, imploring Her Majesty to urge, at the opening of Parliament, the necessity of instituting immediately an inquiry into the state of the working classes in the agricultural districts."

Carmarthen.—We are glad to state, that the accounts received from Carmarthen relative to the state of health of Sir W. Nott, are much more satisfactory. The severity of the attack has passed away, and the physicians, who pronounced his case at first hopeless, are now sanguine in the General's early restoration to health and strength. The utmost interest in his recovery is felt among all classes in Carmarthen. Sir W. Nott has, since his arrival at Carmarthen, purchased a small estate, and workmen are now building a large and commodious mansion upon it, which will be finished by next May.—The local papers state that a subscription is on foot for the purpose of repairing the monument or cairn erected in memory of General Picton at Carmarthen. Lord Dynevor, the Lord-Lieutenant of the county, gives 50*l.*, while his son, the Hon. Colonel Trevor, gives 25*l.* Captain Gwynne, the chairman of the old Committee (now resuscitated), is receiving subscriptions, and there is some prospect that the monument will be restored.

Cambridge.—The Rev. Robert Phelps, D.D., and Master of Sidney Sussex College, was elected, on Tuesday last, Vice-Chancellor of this University, for the ensuing year.

Chatham.—An inquest has been held on the body of the miner who lost his life last week in the siege operations at this place, and after examining several officers and other witnesses, the jury unanimously agreed to a verdict, "That the deceased James Sullivan was accidentally killed by coming in contact with foul air in the field-works on Chatham-lines: and the jury are of opinion that no blame or want of caution attaches to those in command of the siege."

Cheltenham.—The Rev. Francis Close of this town, on Monday last caused the walls of the town to be posted with large bills, announcing that on the 5th November he would preach a sermon against the Cambridge Camden Society, in which he would prove that "the restoration of churches is the restoration of Popery." On Tuesday the church of St. Mary's, of which the Rev. gentleman is incumbent, was crowded to overflowing; and in the course of the sermon (upon the 18th chapter of the 2d Book of Kings, verse 4), he observed "that the Cambridge Camden Society had openly become the allies of the Puseyites; and as there was tractarianism doctrinal at Oxford, there was also tractarianism 'artistic' at Cambridge—the one a written Romanism here, the other a sculpture one there. The Puseyites were introducing strange forms and ceremonies into the Church, and the Cambridge Society were building and remodelling our churches for the express purpose of restoring images, and preparing symbols for the adoption of the tractarian party at Oxford—in other words, erecting temples of Puseyism throughout the land in order to propagate the Oxford heresy. If the religion of the present day was pure and undefiled, it were worse than useless to restore our churches fit only for the worship of the dark ages, happily passed away," &c.

Derby.—A fatal accident occurred in this town on Tuesday. A few weeks ago the Town Council and Commissioners of the borough agreed to arch over the Glitting mill-brook, in the Morlege, with the view of adding a large plot of land to the cattle-market. Accordingly, a Mr. Sims entered into a contract to carry out the extensive work, in connexion with the large sewer just completed, at a great expense to the town. The works were commenced a few weeks back, and one portion of the arch over the brook completed, all but removing the centres. On Tuesday morning Mr. Sims's labourers commenced removing the centres, and whilst in the act of taking away the last prop the whole mass of material fell in, burying the unfortunate men in the ruins. News of the accident was soon in all parts of the town, and thousands of people rushed to the spot. Every possible exertion was made to remove the materials, but from the immense quantity which had fallen, this was a work of some time, although there was no lack of willing hands. The first body found was that of the contractor's son-in-law; and six dead bodies, all of them more or less mutilated, were afterwards extricated.

Horsham.—Considerable excitement prevailed in this town on Thursday last, on its being ascertained that Mr. R. H. Hurst, M.P. for the borough, had left with his family for France, having previously discharged all his servants. It has long been apparent to the tradesmen that Mr. Hurst's circumstances were much embarrassed, but none were prepared for his leaving the place on so short a notice. The household furniture, farming stock, &c., are intended to be sold by auction. Many tradesmen and others are sufferers to the amount of several thousand pounds. Mr. Hurst's liabilities, it is said, exceed 150,000*l.*, and his son, Mr. R. H. Hurst, jun., has become responsible for his father's debts to the extent of 80,000*l.* The estates acquired by purchase by the late Mr. Robert Hurst are strictly entailed, and Mr. Hurst and his son only take life-interests under the will.

Northampton.—The expected visit of the Queen to Northampton next week, on her way to Burleigh House, has caused the greatest excitement in the town, which has not been visited by a Queen Regnant since the days of Elizabeth. The Corporation have voted an unlimited sum towards celebrating the event, and are going to meet Her Majesty in robes, which will be the first time they have worn them since the Municipal Bill passed. In anticipation of the Queen coming from Weedon, the ruins of the ancient castle are to be restored by temporary erections, so as to give it the appearance it had when the Henrys and King John held their Parliament there. Triumphal arches will be erected, the poor feasted, and a subscription opened for the purpose of erecting a dispensary, to be called the "Victoria Dispensary."

Oldham.—A dreadful accident occurred on Thursday, the 30th ult., in a suburb of Oldham, named Lower House, Greenacres Moor, at the mills of Messrs. Radcliffe, called the Lower-House Mills. The firm had recently built a new mill adjoining their old one, and about half past 3 on Thursday afternoon, the whole of this new mill fell in with a tremendous crash, at a time when there were 32 persons in it, of whom no less than 20 have been killed. Of the remaining 12, six were more or less hurt, of whom one is not expected to recover; and six escaped with little or no injury. On Saturday evening an inquest was held, at which 9 or 10 witnesses were examined, but nothing transpired to throw any light on the cause of the accident, and at the request of the jury the inquest was adjourned. On Wednesday, after receiving a report from the surveyors, stating that the accident was caused by a defect in one of the arches and by the weakness of the beams, the jury returned a verdict of "Accidental Death." Persons who saw the accident from the outside of the mill, describe the outer walls as first bulging or springing outwards, and then instantly collapsing and falling inwards, but some portion seems to have been forced outward by the great masses of brickwork, iron, &c., falling within the building. The authorities of the town have called a public meeting for the purpose of devising the best means of raising subscriptions for the relief of the sufferers. Most of the persons killed are old servants of the firm, some of them having been in their employ 30 years. The amount of damage to the property will probably not be less than 4000*l.* The new mill is not insured. At present, to add to the other casualties, about 800 hands are thrown out of employment by this catastrophe; but it is expected that the old mill will be at work again in about ten days.

Oxford.—The Rev. Charles Penny, M.A., student of Christchurch, and curate of Ashendon, has resigned his studentship, on conforming to the Roman Catholic faith. A letter has also been received from the Rev. J. H. Newman, of Littlemore, addressed to the Rev. Isaac Williams, author of the famous tract "On Reserve, &c.," intimating that he can no longer continue a member of the English Church. The intelligence has created a great sensation, as it is supposed Mr. Newman's secession will be followed by that of several others.

Portsmouth.—La Favori, French cutter, whose arrival at this port was noticed in our last, brought the following dispatch addressed to Admiral Sir C. Rowley, by Baron Mackau, Minister of Marine:—"Paris, Oct. 26, 1844. Monsieur l'Amiral—The official reports which I have received from Vice Admiral Baron de la Susse contain the most ample details of what took place at Portsmouth relative to the reception given to the officers of the French squadron by the inhabitants of the above port, as also by the numerous naval officers there present, high and honourable representatives of the British service. He at the same time rendered to me an account of the increased *éclat* given to those noble demonstrations by the visit which Her Most Gracious Majesty the Queen of England deigned to pay on board the frigate Gomer, after the departure of His Majesty the King of the French. The first generous greetings which, in accordance with the example invariably shown by your Excellency, were so worthily manifested by the officers of the Royal Navy, the principal authorities and inhabitants of Portsmouth, have been crowned in a manner the most flattering, inasmuch as it pleased her Britannic Majesty to confer upon the vessel bearing the flag of Vice Admiral Baron de la Susse the distinguished honour of her presence. Such generous condescension has been felt in the most lively manner throughout the whole of the French Royal Navy. I, therefore, Monsieur l'Amiral, in the name of the naval and military body at the head of which I have the honour to be placed, request your Excellency to accept for yourself, personally and especially, our marked thanks, and to have the kindness to make known, as far as it is possible, to the officers of the British Navy, as well as to the different personages who on that occasion associated themselves with the feelings and sentiments so warmly expressed, the profoundly grateful recollection we shall ever preserve, of the reception shown us in the port of Great Britain where the flag of your Excellency is to be seen flying. This reception, which at once establishes, in the eyes of the world, the existence of the most friendly feelings, and which I have seen so many times manifested between the navies of the two countries, is in the present day the indelible sign of the just and mutual esteem which unites them. Whilst I congratulate myself from the bottom of my heart, Monsieur l'Amiral, in being called upon to render myself, on this occasion, the faithful interpreter of this sentiment, I also esteem myself happy to be able to add to it the personal assurances of the very high consideration with which I have the honour to be, your Excellency's very humble and obedient servant, Vice-Admiral, Peer of France, Minister, Secretary of State of the Navy, and of the Colonies, Baron de Mackau."—The Cornwallis, 72, bearing the flag of Vice-Admiral Sir William Parker, has arrived from the East Indies. The Dwarf, steam-tender to the royal yacht, having had her screw examined and readjusted, has been engaged during the past week in working to and fro between the Round Tower and Southsea Castle, having on board the Coast Defence Commission, surveying the fortifications, prior to strengthening and improving them.

Plymouth.—On Saturday, at mid-day, a fire broke out suddenly on the premises of Messrs. Beal and Forster, at Coxside, where an extensive business is carried on with saw-mill machinery, &c. The fire originated in the turning-loft, and by the exertions of the military and police it was confined to that quarter. The workshop and lofts, containing a large and valuable stock of mahogany and other woods, furniture partly manufactured, turning-lathes, and other materials, were entirely destroyed; but the saw-mill machinery, steam-engine, and the larger portion of the stock escaped. The fire is suspected to be the work of an incendiary, the proprietors having lately received threatening letters written by parties opposed to machinery; and, during the progress of the flames and on the following day, exulting expressions were uttered by sawyers and others connected with factories of this description. This suspicion is strengthened by the fact that the premises were carefully examined the evening previous, and the fire commenced in a part most easily approached by an incendiary.

Romford.—On Monday, the day fixed for the appearance of Messrs. Johnson and Mann, the partners in the late Romford Bank, on their adjourned final examination, the bankrupts came again before the Court. It was stated that they were not prepared to pass, and further time was requested to prepare the accounts. After some discussion it was agreed that the bankrupt Mann should come up for his last examination on the day of audit, and that the bankrupt Johnson's examination should stand adjourned for three months. An application for an allowance to Johnson, sen., was made, but, as on former occasions, was opposed and rejected.

Stafford.—The Earl of Shrewsbury, who subscribes such large sums towards the erection of new Roman Catholic churches in every part of the kingdom, is building, at his own expense, a splendid church at Cheadle, in this county, about five miles from Alton Towers. In addition to the materials for building this church, which is to be composed entirely of stone, his lordship intends to spend no less a sum than 25,000*l.* in ornamenting and completing it. The ornamental portion of the building is to be of the most magnificent description, and altogether it will be one of the finest things of the kind in the kingdom. His lordship is also erecting a new church at the village of Alton, about a mile from his seat, solely at his own expense, with a monastery for a new order of monks to be established there. This building will cost a great deal of money, and will be of the most complete character.

Stockport.—On Tuesday a fatal accident occurred at the Churchgate factory in this town, belonging to Messrs. Elkanah and S. H. Cheetham, by the falling of a large chimney attached to the works, which caused the death of two men, and seriously injured two or three others. The chimney had for some time been in a dilapidated state, and the recent high wind and dampness had rendered its state still more dangerous. On Monday nearly a cartload of bricks fell from the top on the roof of a factory below, in consequence of which the hands refused to work, and the engine was stopped. Next morning it was determined to take it down, and several men were engaged for this purpose. About noon they had taken down about 5 yards of it, and most of the men and factory hands had left for dinner, when the whole mass suddenly fell, carrying down the boiler-house, and almost entirely filling with bricks, timber, and rubbish, the yard and reservoir. A sweep was at the top of the chimney at the time, engaged in the work. Finding it going, he leaped off, but was followed by the mass of brickwork, and thrown violently into the water, at one corner of the reservoir, a great weight of bricks falling upon him. He was extricated from his situation as soon as possible, but was much injured. Two other men were found under the brickwork quite dead.

Windsor.—Her Majesty and Prince Albert have long contemplated the erection of schools in a convenient situation on the Royal domains, for the education of the park and gamekeepers' children. A spot, admirably adapted for such a purpose, having been selected at the west end of the gardens at Cumberland-lodge, about a mile from the statue of George IV., the necessary plans of the intended building, executed under the orders of the Commissioners of Woods and Works, have been submitted to and approved of by Her Majesty. The building will be in the Elizabethan style, and erected at the cost of about 1500*l.*, which will be defrayed by Her Majesty and the Prince.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2430*l.*; Bristol and Gloucester, 1005*l.*; Eastern Counties, 4334*l.*; Edinburgh and Glasgow, 2522*l.*; Great Western, 16,510*l.*; Grand Junction, 8053*l.*; Glasgow, Paisley, and Ayr, 1702*l.*; Great North of England, 1851*l.*; London and Birmingham, 16,047*l.*; South Western, 6217*l.*; Greenwich, 728*l.*; Brighton, 5040*l.*; Croydon, 157*l.*; Liverpool and Manchester, 4958*l.*; Manchester, Leeds, and Hull associated, 5859*l.*; Midland, 10,122*l.*; Manchester and Birmingham, 3267*l.*; Newcastle and Carlisle, 1872*l.*; Newcastle and Darlington, 1031*l.*; Preston and Wyre, 356*l.*; Sheffield and Manchester, 661*l.*—A meeting, numerously attended, was held on Monday at Milton-next-Sittingbourne, for the purpose of considering the merits of the various competing lines through the northern part of Kent. The chair was taken by Mr. Hinde, one of the coroners for the county, and the meeting was addressed by Sir John Fielden, Bart., who, in a lengthened speech, proposed an independent line. This was opposed by the Solicitor to the South Eastern Company, who pointed out the public advantages which would be realised by permitting the Company to make the line, and pledging them to carry out their promises. An amendment was then proposed in favour of the South Eastern Company, and carried by a large majority, not above 40 hands being held up for the original motion.—A meeting of the Provincial Committee of the Windsor Junction Company took place last week, for the purpose of receiving the report of the engineer, and adopting a resolution thereon, as to the most eligible line, previous to the details being submitted to Her Majesty. The following resolution was unanimously adopted, subject to its confirmation at a general meeting of the subscribers—"That the proposed lines of railway shall be from Windsor to the Great Western at Slough, and from Windsor to Staines, thereby connecting Staines with Windsor and the Great Western." A copy of this resolution was transmitted to Mr. Anson, Her Majesty's Private Secretary, for the purpose of being submitted to the Queen. Nearly 1000 shares have already been subscribed for by parties residing in the neighbourhood of Windsor. The main line is intended to commence in Datchet-lane, near Windsor-bridge, proceeding to Datchet, and thence to the Metropolis, through Colnbrook, Hounslow, Brentford, and Hammersmith. A branch line is intended to proceed from Datchet to Staines, there to join the Richmond and Staines Junction. A second branch is contemplated from Datchet to join the Great Western somewhere between the Slough and West Drayton Stations. The terminus to the main line will be at Millbank, whence a railway will be constructed, according to the arrangements at present contemplated, for the exclusive use of Her Majesty and the Court, direct to Buckingham Palace, thus bringing Windsor Castle within 35 minutes' journey of the Palace.—The Quarterly Meeting of the Grand Junction Company took place on Friday, when the usual dividend of 2*l.* 10*s.* per share, or 10 per cent., was declared. The chairman made a speech in explanation of the difference existing between the Grand Junction and the London and Birmingham Boards, stating that the Grand Junction were prepared for any alternative, and the needful measures were being taken for bringing before Parliament their Shrewsbury and Wolverhampton line, and also that from Shrewsbury to Stafford. He said that if the Board of Trade and Parliament should conceive that the Shropshire public will be better served by other parties than by this company, they must, of course, submit; but he was informed that there were insuperable difficulties between Birmingham and Wolverhampton to a competing line with that proposed by the Grand Junction. The chairman concluded by saying, that if Parliament would only protect them against unnecessary competing lines, the public would be vastly benefited; for they had no wish to have excessive dividends; their view, on the contrary, being to divide with the public the profits of increased traffic, both in the way of lower prices, and of greater accommodation.—The Birmingham and Gloucester Company, in special meeting, have determined to construct a deviation line through the city of Worcester, and from thence to Droitwich and to Wolverhampton, reserving their main line to the south of Stoke Prior. To effect this object, 500,000*l.* are to be raised by the issue of 10,000 shares of 50*l.* each.—A meeting of the Sheffield and Manchester Company was held on Monday, to consider the terms of the lease to be granted conjointly to the Midland and the Manchester and Birmingham Companies; the period of the lease to be 30 years, terminable at the end of 10 or 20 by a three years' notice from either party; rent to be 5 per cent. on a capital of 900,000*l.* But should the weekly receipts throughout the year average more than 2800*l.*, the rent to be 5½ per cent.; if above 3000*l.* to average 6 per cent.; and for any further average increase of 250*l.* a week, to increase ½ per cent. up to 10 per cent. The chairman moved that these terms be accepted; upon which an amendment was moved in favour of the Manchester and Leeds Company which had offered to lease the line on more favourable terms, viz. 6 per cent. A prolonged discussion followed, during which several gentlemen supported the original proposition; some spoke in favour of the amendment, and two advocated the continuance of the Company on its present independent footing. The amendment was ultimately negatived, only 24 hands being held up in its favour, and nearly ten times that number against it. The original motion was then put and carried with another, authorising the directors to apply to Parliament for the necessary powers.—A meeting of the great North of England Company was held at Darlington on Monday, at which it was unanimously resolved to undertake the formation of a railway from a point in the new line, near Cooper House, in the parish of Croft and township of Dalton, to Richmond, in addition to the Harrogate and Ripon Junction, which a special general meeting of this Company, on the 15th ult., resolved to undertake; and the Directors were authorised to order the necessary surveys, and apply to Parliament next session.—At a public meeting at Cambridge last week, resolutions in favour of the proposed Cambridge and Lincoln line were adopted, with an expression of opinion from the Chairman that this line by St. Ives, Bedford, and Peterborough, to Lincoln, had many advantages over that of the direct London and York. The trifling shortening of distance effected by the latter, he said, would be more than counterbalanced by the increased speed of the Cambridge and Lincoln line, which ran nearly all the way on a level, and could thus be accomplished at much less expense. With regard to the station, it had been considered more advisable to have a joint station with the Northern and Eastern Company's line, and they had the support of all the Companies at present in existence. It was also stated that a railway is likely to be formed from Tottenham to Farringdon-street, which will be of incalculable advantage to the Cambridgeshire dealers, for the conveyance of their cattle to the London market, giving them a station in the very centre of the metropolis.—An active opposition to the Kendal and Windermere railway has sprung up in the locality which it is intended to traverse. At a public Meeting held last week, Professor Wilson in the chair, resolutions were passed pledging those present to oppose the railway by all legal means, and subscriptions were entered into to carry that object into effect. The Earl of Bradford and other influential landowners were among those present.—A Meeting of the North Wales Mineral Railway Company, from Chester to Wrexham, was held last week, at which it was resolved to extend the line from Wrexham to Ruabon, in order to connect the important mineral districts through which the extended line will pass, with Liverpool; and to afford greater facilities to travellers reaching the vale of Llangollen and the beautiful scenery of the northern part of the principality, Ruabon, the proposed terminus being near Llangollen.—We learn by the *Railway Chronicle* that there was a collision on the Midland Railway on Saturday evening. The mail train from Derby, having two engines, after having run about 17 miles, when past Stretton station, ran into some empty waggons, part of the waggon-train having broken adrift. It was in a cutting and on a curve, and it appears that the guard of the waggon-train, who is well accustomed to the business, had not gone back to give the proper signal. He has been taken into custody. On striking the waggons, the two engines were thrown across the railway so as to form a complete barrier, and one of the drivers was seriously injured in the head. The passenger trains, both up and down, were detained upwards of five hours before one of the lines could be cleared, and the up passengers were taken back to Chesterfield. None of the passengers were injured, and one man only, next to the engine, was slightly hurt.—The surveyors appointed to inspect the proposed line of railway between the Bricklayers' Arms station of the Dover, Brighton, and Croydon Railway and Nine Elms, in order to form a junction with the South Eastern and South Western to include approaches from Hungerford, Waterloo, and Westminster bridges, have been very active for several days on the Surrey side of those bridges, in surveying the property through which the line will pass, preparatory to the intended application to Parliament.

IRELAND.

Dublin.—The violence of the gale of Friday night and the whole of Saturday, has been productive of numerous shipwrecks, and considerable damage on the eastern coast. A number of vessels from Liverpool and other parts at home and abroad, were driven for shelter to Kingstown Harbour, and many of them, owing to the insufficiency of their ground-tackling, were much injured. The light-ship at West-bank parted her chains, but was replaced on Sunday. The railroad from Kingstown to Dublin sustained no injury; but in various parts of the harbour the storm and the waves have left traces of their fury after them. A steamer was lost on Saturday morning off Lambay, and all hands perished. The Kingstown, from Liverpool to West Africa, parted her chains, and was stranded, and came into collision with the William and Isabella, from Archangel to Gloucester, timber laden. The Kingstown was subsequently destroyed by fire, but the crew were saved. The sea washed over the pier at Kingstown as high as 50 feet. A more continuously violent storm is not within memory, and it is feared that several vessels have been totally lost, of which we have no accounts yet.—Railway speculations have imparted a life and spirit throughout Ireland to which it has heretofore been a stranger. The subject excites the greatest possible interest amongst all classes, and party-feeling has not as yet mixed itself up with the matter. The Great Western Railway Company from Dublin to Athlone, has been in treaty with the Royal Canal Company, and have purchased the land from the directors. The railway is to run along the south bank of the canal, from Dublin to Mullingar; but at the same time not interfering with the navigation of the canal, which is to proceed as usual. The whole of the shares in the Waterford and Limerick Company have been taken, and applications for a considerable number over the requisite capital have been made, although scarcely three weeks have elapsed since this scheme was originated, and the prospectus has been before the public not more than ten days. There is to be a railway from Drogheda to Kells by Navan—an independent line. Another from Clare to Limerick is spoken of, and one from Kilkenny to Waterford with wooden rails.—Lieut. Puddicombe, of the Royal Marines, whose recent trial in Cork made so much sensation, is ordered to rejoin the Portsmouth division.—Mr. O'Connell has addressed a letter to the Editor of the *Kerry Examiner*, in which he requires him, as well as all other Repealers, to suspend his judgment about "Federalism" until the Federalists themselves think proper to tell them what it is. He concludes by saying, "Whatever shall be the result, you may easily venture to believe that I, for one, will never consent to receive less for Ireland than she had before. I am ready to accept as much more for her as I can possibly get."—Mr. John Lawless has withdrawn from the Repeal Association in consequence of Mr. O'Connell's declaration in favour of Federalism.—The weekly meeting of the Repeal Association was held on Monday, Alderman Butler in the chair. Mr. O'Hea read a resolution to the effect that the Association deem it a paramount duty to call on the people of Ireland to sustain with all their energies the collection of the O'Connell tribute to be made on the 17th inst. In this generous work, he said, all were expected to combine. It was a duty no less pleasing to him to move, than it would be gratifying to the Association to pass such a resolution. The tie which existed between the people of Ireland and their Liberator was of a nature that rendered it indissoluble. It was the duty of the people to express their gratitude to their great leader by showing to him and to the world that his pecuniary resources should not be diminished by his devotion to their service. Mr. O'Hea then pronounced a panegyric on Mr. O'Connell, in the most glowing terms, and called upon the people universally to be ready with their contributions on the 17th inst. Capt. Broderick seconded the motion, which was unanimously agreed to. Mr. M. O'Connell then read a letter from Mr. W. S. O'Brien, on the subject of "Federalism," from which the following is an extract:—"For my own part, I feel persuaded that a simple repeal of the union—that is, a return to the international arrangements stipulated in 1782 between Great Britain and Ireland, accompanied by a reconstruction of the Irish Parliament upon a reformed principle—is both more easily attainable, and when attained, more conducive to the interest of Ireland than any federal constitution which can be devised. But though such be my individual opinion I am not prepared to reject any plan for the repeal of the union which shall appear to be more practicable and more satisfactory to all who may fairly claim to be parties to the adjustment of this great question. Give to Ireland ample powers of self-government, and on this condition we are willing to consider what frame of constitution will at the same time tend most effec-

tually to maintain the strength and unity of the British empire. We invite those who call themselves Federalists to point out to us the means by which this twofold object can be attained. We profess ourselves disposed to make some concession of opinion, and to try a Federal constitution by way of experiment, if they can show us that the benefits of domestic legislation will be thereby more speedily realised; but we will give no consent to any project which does not reserve to Ireland full power of protecting its own domestic interests." Mr. O'Connell's letter to the Kerry paper, noticed above, was also read, together with one to the Secretary of the Association, urging all Repealers to avoid any union with the Rechabites, and stating his "decided opinion that every individual member of the Rechabite Society is guilty of a transportable offence—that is to say, of an offence for which he is liable to be transported for the term of seven years." Dr. Nagle then read from a newspaper a letter addressed by the Hon. Mr. Hutchinson to the Protestants of Ulster, inviting them to join the Repeal. Mr. M. O'Connell moved that Mr. Hutchinson's letter be printed and circulated in the north of Ireland. The next letter read was from Dr. Burke, of Clonmel, inclosing 20*l.* from Repealers in that locality, including several Protestants. Mr. M. O'Connell acknowledged the receipt of 5*l.* 12*s.* from Boston, America, and read a letter from his father, advising the Association to put forth all its energies to crush the Riband system, which he denounced in the strongest and most forcible language. Mr. M. O'Connell proceeded to reiterate the sentiments of the letter, and to enlarge at great length upon the evils and atrocity of the Riband system, which he said, like all their plagues came to them from England. He warned the scoundrels who were the agents of the body, that the Association was on their track, and would drag them to light and justice. He regretted to say that the system was on the increase, and he had received a letter from a clergyman in Leitrim, who stated that there were numbers of associates in that county. In conclusion he moved that it be referred to a committee to report upon the Riband system. Mr. Balfe seconded the motion, and bore his testimony to the prevalence and dangers of Ribandism. Mr. M. O'Connell next addressed the meeting on the state of the registry. Several sums of money were handed in and letters read, and the rent for the week was announced to be 289*l.* 15*s.* 2*d.*

Tipperary.—On the evening of the 29th ult, a man named Ransford, when returning to his residence at Ballanahinch, in this county, was waylaid and nearly murdered by an armed party. He was fired at, and received a gun-shot wound in the thigh, and was also stabbed and left for dead. Four persons have been arrested at O'Brien's bridge, Clare, charged with this offence, and one of them has been identified by the wounded man. The cause of this attack is not known.

Clare.—Another dreadful murder has been committed this week, the victim being Arthur Gloster, Esq., of Moylish, a landlord who had taken legal steps for the eviction of some of his tenants. The scene of this murder is the county of Clare, which for several years has been remarkably free from agrarian crime. Mr. Gloster, a few years ago, purchased under the courts an estate at Toonah, between Kilkeshan and Spancahill, in this county, for which he paid from 10,000*l.* to 12,000*l.* The tenants on the lands have been for several years in possession; and report states, that deceased had notices served on some of them with large families, and had proceeded there preparatory to eviction. But on his return home on Monday evening, between four and five o'clock, at a short distance from Kilkeshan, he was shot dead in his gig. Mr. Gloster was unmarried, and was considered wealthy.

SCOTLAND.

Glasgow.—During the storm on Friday afternoon the tall chimney, 240 feet in height, at the works of St. Rollox, immediately adjoining the Glasgow and Garnkirk Railway depot, gave way at the foundation, and in an instant, not one brick was left upon another. This stalk was only finished a few weeks ago, and about the same time it was discovered that its base was not secure. Means were accordingly taken to insure its stability, by propping and otherwise, and little fear was entertained but that it would stand. Its descent was almost perpendicular, and it therefore occasioned little additional damage, for although a portion of the bricks fell within the railway depot, and upon the rails, no farther accident was the result.—On the same day a fire broke out in the small village of Strathaven, by which upwards of 40 houses with a brewery and tan-work were destroyed, and nearly 100 families reduced to destitution. The wind was so high that the flames were only checked by pulling down some houses in the line of their progress. The loss of property by the fire has been very considerable, few of the houses were insured, and the sufferers themselves are mostly of the poorest and most industrious part of the community.

Kilmarnock.—Some information has at length been received regarding the two individuals whose singular suicide we narrated in our last. It is now ascertained that the parties were Mr. Joseph Barker, formerly of Manchester, and his wife. Mr. Barker was one of the firm of John and Joseph Barker, Cromford Court, who were largely engaged in the German trade, had establishments in London, Malta, and other places, and failed about the year 1814. Mr. John Barker, it appears, died shortly afterwards, but Mr. Joseph Barker subsequently resided in London, and more recently travelled some time for a house at Birmingham. This employment he left a few months ago, with a view to a connection with a house in London, in which, however, he did not succeed: and it is supposed that disappointment on this score, and probably the exhaustion of his resources, led to the commission of the fatal act.

Miscellaneous.

Dr. Wolff.—Captain Grover has just received the following letter from the Rev. Dr. Wolff: "Meshed, Month of Shrivan, 23. My dear Grover.—Not venturing when at Bokhara to keep a journal, I have forgotten the date of the Christian month! After the infamous Nayib Abdool Summut Khan had forced from me the promise to pay him 6000 tolas, I should, after all, have been put to death, if Abbas Kuli Khan, the Persian Ambassador, had not saved me. I am now in Persia, broken down in constitution, robbed of everything I had, and with a debt of 6000 tolas (2500*l.*), which I am to pay to the brother of the Nayib Abdool Summut Khan, who is to accompany me to Teheran. You thought that 4000*l.* might be collected for my mission; if you can now assist me in paying the debt above-mentioned to the infamous Nayib, who forced the promise from me in his garden, surrounded by his guards, well—if not, I shall be obliged to go to prison in Persia. The King has also sent with me an ambassador who is to go to England, and the Nayib has forced me to promise to pay the expenses of that ambassador out of the money he advanced me. That same ambassador has excited the Turcomans of Mawr and Serakhs against us—*i. e.*, against Abbas Kuli Khan and myself, on our way to Meshed, and forced Abbas Kuli Khan to pay him and the other ambassadors appointed for Persia 150 tillas, in the midst of the desert! Yours affectionately, JOSEPH WOLFF." "Meshed.—The above, though dated at Meshed, was written at Mostroon. I am now at Meshed, and two hours after me your gholam (special courier), Ali Ahmed Beyk, arrived. He found me broken down in Mullah Medhee's house. I will only add, that the Nayib wants only the interest of the above money to be paid to his son when of age. The ambassador from Bokhara is also here; he has letters and presents for the Schah, the Sultan, and Queen Victoria. The Nayib has settled with the King that I should bear the ambassador's expenses from the money the Nayib expects to be paid back. I am not yet out of danger, but am too confused to explain all now. Mullah Mehder will do it for me. Lieutenant Wyburd has been murdered at Bokhara.—JOSEPH WOLFF." (Note by Captain Grover.)—Lieutenant Wyburd, of the Indian army, is another diplomatic victim. This talented officer was sent on a secret diplomatic mission to Khiva, in the year 1835, and has never since been heard of. This unfortunate man, it is right to state, was not altogether abandoned to his fate by the British Government, for, in a letter written to me by Lord Aberdeen's direction, I find it stated, that on Colonel Stoddart's being sent on his mission to Bokhara in the year 1838, he was instructed to inquire after Lieutenant Wyburd. I have not, however, been able to learn that any effort has been made in his behalf since that time. I directed Dr. Wolff to obtain all the information he could concerning this wretched man, and to purchase his freedom should he be in slavery. The Doctor says he has been murdered at Bokhara; but it remains to be seen on what evidence that assertion is made. I am advised to state an interesting circumstance that occurred to me at St. Petersburgh, as it will show that the good Doctor's mission has not been entirely useless. Dr. Wolff was authorised to draw upon my private fortune for the ransom of any Christian prisoners he might find at Bokhara. In the first batch he purchased were 10 Russians, and this circumstance was fortunately officially known in Russia before my arrival. A message was brought to me from the Emperor by the British Minister, expressing His Majesty's thanks and wish to re-imburse me. My reply was, "that I considered it a great honour to have been in any way instrumental in the release of his subjects, and that repayment was quite out of the question." I am glad to have this opportunity publicly to thank His Majesty for his gracious declaration communicated to me by the British Minister,—that his Majesty will do everything in his power for the relief of Dr. Wolff.—JOHN GROVER, Captain Unattached. Army and Navy Club, Nov. 6.

Iron Church.—A church has been sent out to Jamaica as a specimen, as many of the kind are likely to be required. The pilaster supports are of cast-iron, on which are fixed the frame roof, of wrought iron, of an ingenious construction, combining great strength with simplicity of arrangement; the whole is covered with corrugated iron, and the ceiling formed of panelled compartments, covered with felt, to act as a non-conductor of heat. The body of the church is 65 feet by 40; the chancel, 24 by 12; a robing-room and vestry are attached. The windows are glazed with plate-glass, one-eighth of an inch in thickness; the two chancel windows and four others are of stained glass. The cost of this iron church is 1000*l.*—*Glasgow Chronicle.*

The Guano Trade.—We find the following article on this subject in the *Liverpool Albion* of Monday:—We understand some information may shortly be expected on the guano subject. A vessel, on her return voyage from Bombay, has been ordered to scour the western coast of Africa from the Red Sea to the Cape, passing Latham's Island (of which we, some weeks ago, took notice) and proceeding through the Mozambique Channel, in search of the deposits of the boobies, the seals, and the jackass-penguins—precious savings-bank deposits which are to be drawn on at sight. We heartily wish the vessel a valuable discovery. Another such an island as Ichaboe would be worth half a million of sterling gold coin. Latham's Island appears to be still a tantalising subject with some parties, who deny that the island has been purchased, and at the same time assert the inferiority of the guano on it, both in quality and quantity. With respect to the chance of discovering other guano islands along the same coast, it is scarcely problematical. The "Bird Islands" off Algoa-bay, lat. 34, are almost certain to contain more or less of this valuable deposit, as they have been the retreats for myriads of large birds and seals, which, according to Horsburg's East India Directory, "literally covered them." The only questions on the subject, for which we must wait, are, whether all the guano has been washed off into the sea, and whether, if there be any, it is of good or inferior quality. Now, one of these islands is half a mile in length, and it must be confessed it is difficult to conceive that all the deceased ancestry of the present gannets, penguins, and seals, together with all their labours, performed during a period which a local orator was wont to call "an interminable roll of ages," can be submerged in the pretty deep soundings by which this group is surrounded. Our townsman, Mr. Payne, whose pamphlet on testing guano we have already noticed, observes,—"It has been asserted, that in those places only where little or no rain falls can good guano be found; that rain would dissolve its manuring virtues, and cause them to ferment and evaporate. But as all facts should be borne out this assertion, it may well be disputed. We know, that in using guano as a manure, it is advisable artificially to water it, if rain does not speedily fall after putting it on the land. We know that the watering dissolves the guano, and causes its virtues to descend into the soil. Why may we not imagine a similar process to exist at large guano deposits where there is abundance of rain? Why may not the rain dissolve, by putrid fermentation, every successive top stratum of dung and animal remains, and cause the ammoniacal compounds, their salts, and even their azotised animal matter, to descend into the lower strata? If this supposition be correct, it necessarily follows, that in all large deposits where there is rain, the top stratum would be of inferior, and the lower strata of superior quality. The fact that there is more than one quality at Ichaboe, and that the latest deposit is not the best, renders this supposition highly probable. It is absolutely certain that the greatest part of any large deposit of guano must be some thousands of years old, and that its production and accumulation has been preceded by the effervescence and putrid fermentation accompanying the decomposition of animal matter. Its long retention of carbonic acid and azotic gas, even in situations where there is little or no rain, is not less surprising than the supposition that in places where abundance of rain falls the production could proceed, and the lower deposits, after receiving the successive drainage from the uppers, become of equal value with the best guano imported. We see a similar process in the common dung-heap of the farmyard. The rains washing the exterior do not destroy the prolific virtues of the interior deposit." We are reminded of this extract by some conversation we have lately had with a very intelligent shipmaster, who reports that at Ichaboe, on breaking ground over the deposit, no less than 3 feet depth of rubbish, feathers, and what not, have to be cleared away before the fine, prolific dust and ashes can be reached. This is a singular fact when it is borne in mind that the birds have been fully employed in taking their ease on this place up to the present time, and that at this moment they are disputing every inch of ground, and have their heads knocked, with very little ceremony, to make them understand the precedence of man."

Theatricals.

DRURY LANE.—On Monday next will be given at this Theatre, the hundredth representation of Mr. Balfe's *Bohemian Girl*, a work entirely of native talent. This circumstance is said to be unparalleled in the modern history of the British stage, and in order to give effect to the performance, Mr. Balfe, who has arrived in this country to superintend the production of his new opera, will preside in the orchestra. A handsome piece of plate is to be presented to him on the occasion, raised by subscription, at the head of which stand the names of the Duke of Devonshire and the Marchioness of Conyngham.

Law.

COURT OF QUEEN'S BENCH.—*In the matter of Jacques Besset.—Habeas corpus.*—The case of this party has been already noticed in this Paper. On Saturday last Mr. Chambers obtained a *habeas corpus* to bring up the prisoner into this court, and he was [illegible] appeared at the bar in custody, and the return to the writ set forth, as the cause of his detention, that he had in France committed the crime of fraudulent bankruptcy, and had been arrested here under the provisions of the convention between France and England for the mutual delivery of persons who, being guilty of one country, and having committed a crime there, had afterwards taken refuge in the other. After the return had been read, Mr. Chambers moved that the prisoner be discharged. Mr. James, upon the part of the prosecuting creditors, opposed the motion, in the first instance, upon the preliminary objection that a foreigner who has committed a crime in a foreign country, and who has taken refuge in this, is not entitled to have a writ of *habeas corpus* at all, if the crime which he has committed be such that he cannot be tried for it in this country. The learned counsel referred to and read the Habeas Corpus Act of the 31st of Charles II., for the purpose of showing that under the act no writ of *habeas corpus* could be granted, unless in contemplation of a trial or discharge for a crime alleged to have been committed within the jurisdiction of the English Courts. The learned counsel then referred to the next statute upon the subject, which was the 56th George III. c. 100, which extended the remedy to cases other than those involving criminal or supposed criminal matter; but contended that according to the wording of that act, as well as of the recent act of the 6th and 7th Victoria, ratifying the late convention, a person who had fled to this country to avoid the consequences of crime committed in France, was liable to be detained till delivered

up to justice, and no fugitive criminal from France was entitled to be discharged on *habeas corpus* in this country.—Lord Denman. Then you must contend that in all such cases all the gaolers in this country are gaolers of the King of France. Mr. James admitted that he did not go to that extent. Lord Denman observed, that the direction in the warrant of commitment was, that the prisoner was to be detained until he should be discharged by due course of law; but, according to the argument of Mr. James, the party would be considered as "discharged by due course of law" if he was given up to the custody of a person by whom he would be taken to France for the purpose of being punished for the crime. Mr. James said, that he did not mean to lay down that position so broadly. What he contended for was, that "the due course of law" must be now understood in reference to that "course" of proceeding which was provided for in the recent statute; and in the event of no requisition from the Ambassador, and no warrant from the Secretary of State, that the "discharge by the due course of law" would be by the release of the prisoner from custody, and not by his being handed over to the French authorities to be brought to trial in that country. Mr. James concluded by submitting that even if the Court should be of opinion that the present warrant was defective, it would still be in their power to recommit the prisoner to the same custody. The Solicitor-General, with whom was Mr. Gurney, appeared for the Lord Mayor, as the committing magistrate, to submit to the decision of the Court. Lord Denman said, that the Court regretted very much that upon the first proceeding which had been taken under a convention of so much importance to the countries concerned, the principal document should have been composed in such a manner as to prevent the Court from giving effect to the provisions of the treaty in question, which involved a principle of importance to the whole world. But neither the Court nor the gaoler in whose custody the applicant was brought up had any power over that individual except what was given by the recent act of Parliament, which had been pursued in such a manner as deprived all parties of any power to detain the individual in question. The Court had been requested to remand him for some crime of which it was alleged that he was guilty. But the Court knew nothing of any crime except from what appeared upon the warrant, which was insufficient to justify the detention of the prisoner. With regard to that part of the application which requested that affidavits might be read, showing the applicant to be a fugitive criminal, if such affidavits could be received it would not have been necessary to enter into the convention at all, and to ratify it by the statute. His Lordship, therefore, declared the judgment of the Court to be, that the applicant be discharged from custody, and added, that it was to be understood that the writ had issued, not under the statute of Charles II. or Geo. III., but at common law.

SPORTING.

NEWMARKET HOUGHTON MEETING.—THURSDAY, concluded.—*Handicap Plate* of 50*l*. A dead heat between Colonel Peel's I-am-not aware, aged, 7st 2lb, and Mr. Salvin's Alice Hawthorn, 6 yrs, 9st 10lb; beating Lord G. Bentinck's Croton Oil, 3 yrs, 5st 13lb; Mr. Osbaldeston's f. by Achmet, out of Well-a-day, 3 yrs, 5st; Mr. Meiklam's Aristotle, 5 yrs, 8st 4lb; and Mr. Bell's Winesour, 4 yrs, 8st 5lb. This is the last race Alice Hawthorn will run under the present contract, the term for which she was hired of Mr. Plummer having expired. She has now won 47 races and a half, including a great number of Queen's Plates and valuable cups.

FRIDAY.—*Match*, 100. Lord Miltown's Sealteen, 7st 8lb, beat Lord Glasgow's Give him-a-Name, 7st 6lb, by 50 yards.—*Match*, 100, h. ft. Duke of Bedford's Glen Fisher, 8st 9lb, beat Lord Glasgow's Sister to Pathfinder, 6st, by 3 lengths.—*Match*, 60, h. ft. Colonel Peel's Garry Owen, 8st 4lb, beat Lord Sandwich's Plantagenet, 7st, by 10 lengths.—(Second Class.) *Nursery Stakes* of 25 sovs each, for 2 yr olds. Mr. E. Blake's Event, 6st 10lb, beat Mr. Hook's Bastion, 7st, and 4 others which were not placed. Won cleverly by a length.—*Post Match*; 200, one to the post. Colts, 8st 7lb; fillies, 8st 4lb. Lord Glasgow's c. by Bay Middleton, out of Miss Whip, beat Colonel Peel's Hersey, in a canter.—(First Class.) *Nursery Stakes* of 25 sovs each. Lord G. Bentinck's Rose of Cashmere, 7st 11lb, beat Mr. Dawson's Crim Con, 6st 4lb, Mr. W. S. Stanley's Keppel, 6st 7lb; and 4 others which were not placed. Won by a neck.—*Match* 100, h. ft. Duke of Bedford's Panther, 8st 7lb, beat Lord Chesterfield's Tiddly Winks, 7st 13lb, by a head.—*Match*, 200, h. ft. Duke of Bedford's Oakley, 8st 8lb, beat Lord Exeter's Celia, 7st 12lb, by 2 lengths.—*Audley End Stakes* of 50 sovs each, 10 ft., if declared, for 3 yrs old, &c. 13 subs. 3 declared. Mr. Wesley's Counsellor (half-bred), 5 yrs, 8st, beat Mr. Irwin's Mickey Free, 3 yrs, 7st 9lb; Sir C. Monck's Glossy, 4 yrs, 7st 6lb; Mr. Newton's Ma Mie, 5 yrs, 8st 9lb; The Duke of Rutland's Welbeck, 3 yrs, 6st; Lord Exeter's Pergularia, 3 yrs, 5st 10lb; Mr. Ford's Eccola, 3 yrs, 5st 5lb; Lord Exeter's Revocation, 5 yrs, 7st 7lb; and Mr. Gratwicke's Needful, 3 yrs, 7st. Won easily by 2 lengths.—*Match*, 500, 200 ft. Mr. Irwin's Foig-a-ballagh, 7st 7lb, received 150 sovs compromise from Mr. Salvin's Alice Hawthorn, 9st.—*Match*, 200, h. ft. Lord G. Bentinck's Emma, 3 yrs, 5st 10lb, received from Mr. Beresford's The Altered One, 5 yrs, 7st 10lb.

SATURDAY.—*Sweeps* of 10 sovs each, for 3 yr olds: colts, 8st 7lb; fillies, 8st 4lb. Winner to be sold for 50 sovs. 4 subs. Lord G. Bentinck's c. by Slane, out of Jason's dam, beat Mr. Dawson's Teresa, Mr. Payne's Audrey, and Mr. Thomas's Omphale. Won by a length. Winner claimed.—*Sweeps* of 10 sovs each, for 2 yr olds: colts, 8st 7lb; fillies, 8st 4lb. The winner to be sold for 50 sovs. 5 subs. Lord Chesterfield's c. by Sheet Anchor, out of Fair Helen, beat Mr. Hesseltine's Jesse Hammond, Mr. Ford's Fallacy, Colonel Peel's Sister to Cameleon, and Lord G. Bentinck's Duke of Cornwall. Won by a length and claimed.—*Match*, 50, h. ft. Mr. Cooper's Hartshorn, 7st 13lb, beat Lord E. Russell's Nat, 8st 7lb, by 6 lengths.—*Match*, 50, h. ft. Sir J. Hawley's Bishop of Romford Cub, 8st 4lb, paid; Colonel Peel's Garry Owen, 8st 11lb, received.—*Match*, 100, h. ft. Duke of Bedford's Panther, 4 yrs, 8st 10lb, beat Mr. Payne's Walpole, 3 yrs, 8st 3lb, by a head.—*Sweeps* of 5 sovs each: 2 yr olds, 6st 7lb; three, 8st 5lb; four, 8st 10lb; five and upwards, 8st 12lb. Winner to be sold for 25 sovs. 6 subs. Lord G. Bentinck's Duke of Cornwall, 2 yrs, beat Mr. Stebbings's f. by Physician, out of Mary Ann, 2 yrs; Duke of Bedford's c. by Liverpool, 3 yrs; and Lord G. Bentinck's Proof Print, 5 yrs, by a length.—*Sweeps* of 10 sovs each: 3 yr olds, 7st 9lb; four, 8st 5lb; five and upwards, 8st 8lb; the winner to be sold for 400 sovs. 7 subs. Colonel Peel's Garry Owen, by St. Patrick, aged, beat Sir J. Hawley's Bishop of Romford's Cob, 4 yrs; Mr. Shelley's Prince of Wales, 3 yrs; Lord Chesterfield's Cockfighter, 3 yrs; Lord G. Bentinck's Chatham, 5 yrs; and Mr. Meiklam's Philip, 4 yrs. Won by a head.—*Match*, 100. Mr. Payne's Mania, 4 yrs, 8st 4lb, beat Sir J. Hawley's Venus, 4 yrs, 8st 10lb, by a length.—*Match*, 200, h. ft. Mr. Irwin's Mickey Free, 3 yrs, 8st, beat Lord G. Bentinck's All-round-my-hat, 3 yrs, 7st 5lb, by 2 lengths.—*Sweeps* of 10 sovs each: 3 yrs, 7st 7lb; four, 8st 2lb; five and upwards, 8st 7lb; the winner to be sold for 150 sovs. Mr. Beresford's Altered One, 5 yrs, beat Mr. Payne's Queen Mab, 5 yrs; Lord G. Bentinck's c. by B. Middleton, 3 yrs; and Mr. Dawson's Teresa, 3 yrs. Won by a head.—*Houghton Handicap* of 15 sovs each, for 3 yr olds and upwards. 14 subs., 3 declared. Mr. H. T. Worley's Example, 3 yrs, 7st 5lb, beat Duke of Rutland's f. by Beiram, 3 yrs, 6st 12lb. Mr. Buckley's David, 5 yrs, 8st 7lb; Mr. Meiklam's Philip, 4 yrs, 8st 7lb; Capt. Harcourt's Sir Abstrupus, 4 yrs, 8st 5lb; Mr. Gratwicke's Needful, 3 yrs, 7st 10lb; Mr. Death's Isleworth, 5 yrs, 7st 10lb; Mr. Shelley's Five-times-five, 4 yrs, 7st 9lb; Lord Miltown's Anonyme, 4 yrs, 7st; and Lord Chesterfield's Tiddly Winks, 3 yrs, 6st. Won by a length.—*Match*, 200, h. ft. Mr. Irwin's Foig-a-ballagh, 5 yrs, 8st, paid; Lord G. Bentinck's Naworth, aged, 6st 13lb, received.

BIRTHS.—On the 1st inst., in Selkirkshire, the lady of R. C. LIPPINCOT, Esq., of Over Court, Gloucestershire, of a son—1st inst., the lady of the Rev. J. R. CRAWFORD, M.A., Head Master of the Western Grammar School, of twins, a boy and a girl—2d inst., at 41, Eaton-place, the lady of T. D. ACLAND, Esq., M.P., of a daughter—2d inst., in Nottingham-place, Regent's Park, the lady of R. W. PEACOCK, Esq., of a daughter—2d inst., at Camberwell, Mrs. H. F. GOSS, of a son—2d inst., Mrs. J. ROBERTS, Botolph-lane, of a daughter—3d inst., at 12, Wimpole-st., LADY M. HOOD, of a daughter—3d inst., at Hampton Wick, the lady of M. T. COLEMAN, Esq., surgeon, of a son—3d inst., at Studley Castle, the lady of Sir F. GOODRICKE, Bart., of a son—3d inst., at Barnard Castle, the lady of T. HEPWORTH, Esq., of a son—4th inst., at 16, Welbeck-street, Cavendish-square, the lady of P. WILMOT, Esq., barrister-at-law, of a son—4th inst., at 69, Oxford terrace, Hyde Park, the lady of C. WHITLAW, Esq., of a son—5th inst., in Torrington-square, the lady of T. ALLISON, Esq., of a son.

MARRIAGES.—On the 30th ult., at the British Embassy, at Paris, C. SIDNEY HAWKINS, only son of the late J. S. Hawkins, Esq., F.S.A., of Brompton, Middlesex, to THOMASINE MADDISON, eldest daughter of the Rev. J. G. Maddison, late rector of West Mouckton, Somerset—30th ult., at the Cathedral Church of Peterborough, the Rev. H. PRATT, son of the Rev. J. PRATT, rector of Paston, to MARY ANN DAVYS, daughter of the Bishop of Peterborough—2d inst., at All Soul's Church, St. Marylebone, Mr. J. CRUSH, of Mountnessing Hall, Essex, to SARAH BENNETT, second daughter of J. Bennett, Esq., of Pulteney Lodge, Enfield—3d inst., at St. John's Church, Paddington, the Rev. W. F. WINGFIELD, M.A., of Christchurch College, Oxford, second son of the late J. Wingfield, D.D., Prebendary of Worcester Cathedral, to CHARLOTTE NICHOLLS, second daughter of Geo. Nicholls, Esq., of Hyde Park-street.

DEATHS.—On the 26th ult., at Kingsbury, Warwickshire, MARY E. M. WHYTE, daughter of Lieutenant-Colonel Whyte, aged 1 year—27th ult., CHARLOTTE ALLEN, wife of H. Allen, Esq., of the Lodge, Breconshire—28th ult., at Boulogne-sur-Mer, S. F. LETTSOM, Esq., son of the late Dr. Lettsom, of Grove-hill, Camberwell, aged 65—28th ult., at Summercoates, Derbyshire, W. SYLVERWOOD, Esq., aged 39—30th ult., at Burton-upon-Trent, C. J. ALLSOPP, Esq., aged 39—31st ult., at Chelsea College, Mrs. E. LYNN, sister of the late J. Lynn, Esq., of Dorking, Surrey, and formerly of Chelsea College, aged 89—1st inst., at the house of her uncle, H. H. Lindsay, Esq., 7, Stanhope-terrace, Hyde Park Gardens, Miss J. HARVEY, eldest daughter of the late Capt. J. Harvey—3d inst., at his residence, 28, Montagu-square, C. G. UDNY, Esq., Bengal Civil Service, aged 38—5th inst., at Claptons-house, Wooburn, Bucks, after a few days' illness, P. J. FROMOW, Esq., aged 47—6th inst., at Market Drayton, SARAH HORNER, wife of Captain Horner, late of Her Majesty's 55th Regiment—6th inst., at No. 9, Portland-place, I. NICHOLL, Esq., Her Majesty's Procurator General, aged 67—6th inst., at the Rectory, Bishopstone, Herefordshire, U. PRICE, Esq., of Mongewell-house, Oxon, aged 40—7th inst., HENRY FLEMING, second son of T. B. Fleming, Esq., Champion Park, Camberwell, aged 7 years.

INTERESTING TO LADIES. — To Messrs. A. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. GENTLEMEN,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant *"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

*** Ask for "ROWLAND'S MACASSAR OIL." All other are Fraudulent Counterfeits.

IMPORTANT to the FASHIONABLE WORLD.—By far the most influential of all the graces that contribute to personal adornment is the Hair. Its recovery, preservation, and improvement proportionably concern the élégantes of our fashionable circles, and any information which will insure these desirable results will be hailed as an inestimable boon. The following extract from the letter of a respectable chemist in Bridlington will be read with the highest interest:—

"A lady, a customer of mine, has found great benefit from the use of your Balm. About six months ago her hair nearly all fell off. I recommended her to try your Balm of Columbia, which she did. In the course of a few applications the hair ceased to fall off. Before she had used one 3*s*. 6*d*. bottle it began to grow very profusely, and she has now a very beautiful head of hair. "I am, gentlemen, yours respectfully,

"WM. SMITH,

"Chemist and Druggist, Market-place, Bridlington.

"To Messrs. C. and A. Oldridge.—March 13, 1844."

C. and A. OLDRIDGE'S BALM of COLUMBIA causes the Hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again; it also prevents grayness. 3*s*. 6*d*., 6*s*., and 11*s*. per bottle. No other prices are genuine.

OLDRIDGE'S BALM, 1, Wellington-street, the second house from the Strand.

NETTING for SHEEP FOLDS, made of Cocoa-nut Fibre, a material known to possess the most extraordinary durability when exposed to alternations of weather. A prize was awarded for this Netting at the meeting of the Royal Agricultural Society at Bristol, in 1842; and it is strongly recommended to the notice of Agriculturists in the Society's Report for that year. It will wear out several sets of tarred hemp Netting, and is so light that a herdsman can with ease carry 200 yards of it.—Sold in nets of 50 and 100 yards long, 42 inches high, by the Manufacturers, WILDEY and CO., 7, HOLLAND-STREET, Blackfriars-road, London.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their Establishments, 22, Regent-street (corner of Jermyn-street), or 45, Moorgate-street, City. New goods Plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the kingdom and abroad free.

H. WALKER'S NEEDLES (by Authority the "Queen's Own") have large eyes, easily threaded, even by blind persons), and improved points, temper, and finish. Each paper is labelled with a likeness of Her Majesty or His Royal Highness Prince Albert, in relief, on coloured grounds. Every quality of Needles, Fish-hooks, Hooks-and-eyes, Steel Pens, &c., for shipping. These Needles or Pens for the home trade are sent free, by post, by any respectable dealer, on receipt of thirteen penny stamps for every shilling value.

H. WALKER, manufacturer to the Queen, No. 1 (late 20), Maiden-lane, Wood-street, London.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers, for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

READ the following TESTIMONIAL in favour of PARR'S LIFE PILLS, which is sufficient to convince the most prejudiced person that they are all that is required to conquer disease, and, consequently prolong life:—"To T. Roberts & Co.—Sirs,—I beg to hand, you the following Testimonial, which I have just received from Mr. Williams, Union-street, Nottingham.—Yours, obediently, G. BATTERS, Chapel-bar, Nottingham.

"Sir,—Printing is a great blessing to mankind, for now I am enabled to make known, through you, a perfect cure, by taking PARR'S LIFE PILLS, of extremely bad Indigestion, a Bilious disorder, and Sick Headache, which I have been subjected to for years; and money enough has been paid to physicians and surgeons, which now would have been a little fortune to me. I wish every fellow-creature clearly to understand that I was wonderfully relieved by taking one box of PARR'S LIFE PILLS. Accident threw a testimonial in my way of a miraculous cure of a bilious attack and sick headache. The second box enabled me to go about my business with spirit and alacrity; and by taking two or three more boxes, I am happy to add my humble testimony of a perfect cure of that dreadful disorder—Bilious and Sick Headache, which rendered me, before took PARR'S LIFE PILLS, unfit for business. Considering the loss of time and pain, persons would find that one box of PARR'S LIFE PILLS is worth, instead of 1*s*. 1½*d*., as many guineas. May all persons make trial of PARR'S LIFE PILLS, is the sincere wish of, yours, thankfully,

"To Mr. G. Batters. M. WILLIAMS, Union-st., Nottingham."

PARR'S LIFE PILLS are sold by all respectable Medicine Vendors. See the words "PARR'S LIFE PILLS," in White Letters on a Red Ground, on the Government Stamp.

WANT PLACES.—All Letters to be post-paid.

FIVE POUNDS will be given by the Advertiser, to any nobleman or gentleman's Gardener who will obtain for him a situation as GENERAL FOREMAN, where there is not less than six men kept; he has had considerable experience in forcing Cherries, Peaches, Figs, Pines, &c., and is well acquainted with Orchidaceous, Stove, and Greenhouse Plants, having lived in several first-rate establishments.—Direct to R.H., at the Office of this Paper.

AS GARDENER.—A sober, steady Man, who thoroughly understands his profession; would not object to a single-handed place; he can have a satisfactory character from the situation he has just left.—Direct to P. S., 27, Mitre-street, New Cut, Lambeth, London.

AS GARDENER.—A married Man, aged 28, without incumbrance, who has a good practical knowledge of his profession in all its branches; has lived in some of the first situations in North and South Britain, from which places he can be highly recommended, as well as from his present employer, whom he is about to leave.—Direct to A. Z., Mr. Cameron, Nurseryman, Uckfield, Sussex.

AS GARDENER. — A single Man, aged 26, who perfectly understands Forcing, Flower Garden and Kitchen Garden. The cause of his leaving his place is the removal of the family. Can have an unexceptionable character from the family he has just left.—Direct W. H., Mr. Harbon's, Grocer, Brixton, Surrey.

AS GARDENER.—A married Man, aged 26, who perfectly understands his business, and can have an unexceptionable character, where he lived two years; and is now about to leave on account of the death of the lady. The country would be preferred.—Direct to S. G., Sars Grove, Chipping Norton, Oxfordshire; or W. G. C., 14, Milton-st. City.

AS GARDENER.—A single Man, who thoroughly understands the management of the Hothouse, Greenhouse, Flower and Kitchen Garden, and Forcing in general. Can have a satisfactory character from his last employer.—Direct to A. B., No. 4, Trinity-place, Trinity-sq., Boro', London.

AS GARDENER, or GROOM and GARDENER.—A Married Man, without incumbrance; can be well recommended by the Gentleman he has just left. Wages not so much an object as a permanent situation.—Direct to W. A., 1, Little Queen-street, Holborn.

AS SECOND GARDENER in a Nobleman or Gentleman's garden.—A young Man aged 22, who has served four years at the business; the most satisfactory reference will be given.—Direct to A. B., Post-office, Osnaburgh-street, Regent's-park, London.

AS UNDER-GARDENER.—A respectable young man, aged 20, who has been accustomed to the Cultivation of Plants, wishes to obtain a situation under a Gardener, where the Forcing Department, &c. &c., is carried on. The highest testimonials as to Character can be given.—Direct to B. C., Office of this Paper.

TO GENTLEMEN AND FARMERS.

AS LAND-STEWARD OR BAILIFF.—A married Man, 32 years of age, without incumbrance. He has been regularly bred to the most approved mode of Farming, as practised in the Lothians of Scotland; has had a great deal of experience both in Stock and Arable Farming, and has managed a farm of 300 acres for the last ten years; has also studied two years at the Veterinary College of Edinburgh. If required, his wife is competent to take charge of a Dairy. The most unexceptionable references will be given as to character and qualifications from his present employer and some of the most eminent agriculturists in the Lothians. Direct to W. B., Post-office, Torquay, Devonshire.

LARGE STOCK OF SEEDLINGS.

W. AND T. SAMSON, Kilmarnock, Ayrshire, have a large stock of the following plants, which they will dispose of at low prices:—

American Arbor-vitæ, 2 years old . .	50,000	Larch, 1 year old .	1,000,000
Ash, 1 year old .	200,000	Quercus macrocarpa, 1 year old . .	15,000
Beech, 1 year old .	1,500,000	,, palustre, 1 yr. old	25,000
Bullace, wild, 1 yr. old	5000	,, rubra, 1 yr. old	5000
Elm, 1 year old .	200,000	,, tinctoria, 1 yr. old	5000
Holly, 1 year old .	150,000	Scots Fir, 2 years old	1,000,000
Hornbeam, 1 year old	150,000	Sloe, or Blackthorn, 1 year old . .	150,000
Juniper, common, 1 year old . .	50,000	Spruce, 2 years old	1,000,000
Quercus coccinea, 1 year old . .	100,000	Thorn quicks, 1 year old . . .	1,500,000

They have also a large quantity of transplanted Azalea pontica, American Arbor-vitæ, Evergreen Privet, Irish Yew, 1½ foot, Double Redthorn, fine Plants, &c. &c., which they are inclined to sell cheap.

SHILLING'S EARLY GROTTO PEA.

THE above PEA possesses advantages over every other for autumn sowing, being quite hardy, very prolific, and much larger than any other early Pea. See *Gardeners' Chronicle*, 25th of last May. "Mr. Shilling has sent us specimens of his New Early Grotto Pea, which were gathered on the 20th inst. He states that these were produced from seed sown in the open ground on the 25th of last November. Judging from the specimens sent, this is a fine, large, good-looking Pea, and will, no doubt, be found to be a very useful early variety."

To the Market Gardener they will be found invaluable. Price 1*s.* 6*d.* per quart, 10*s.* per peck.

SHILLING'S QUEEN CABBAGE, which gave such general satisfaction last year, as the best early variety grown. Having saved a considerable quantity of seed this summer, it is offered on the following advantageous terms:—1*s.* 6*d.* per oz., 16*s.* p. lb.

Agents—Messrs. Field and Child, 119, Lower Thames-street; Messrs. J. and W. Noble, 152, Fleet-street; Mr. J. Kernan, 4, Great Russell-street, Covent Garden; Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.

Northwarnborough Nursery, Odiham, Hants.

KNAP HILL AND BAGSHOT NURSERIES.

NOTICE.—The Business of these Nurseries, since the death of the late Michael Waterer, carried on in the name of H. and J. WATERER, is by mutual agreement divided. The KNAP HILL NURSERY will in future be carried on by HOSEA WATERER, and that at BAGSHOT by JOHN WATERER. It will, therefore, be of importance, to prevent confusion, that correspondents be particular in the address, and direct letters intended for the Knap Hill Nursery, to Hosea Waterer, Knap Hill, near Bagshot; and those for the Bagshot Nursery, John Waterer, Nurseryman, Bagshot, Surrey.—November 16.

J. T. WILLMER, Sen., having purchased the Stock of those beautiful Pansies noticed in the *Gardeners' Chronicle* of May 18 and June 1, under the initials of "*T. L. H.*" Nos. 1, 2, 3, 4, 6, 10, 11, 12, and described as being a fine set of flowers, large, the upper petals in fine proportion, the side petals generally meeting above the eye, J. T. W. has a few sets of the eight sorts, with their names, to dispose of; the price for each set is 30*s.* Early application is requisite, to insure them. This Advertisement will not be repeated.

Sunbury, Middlesex, Nov. 13, 1844.

NURSERY LARCH.

COWAN AND Co., NURSERYMEN, Glasgow, have on hand a large quantity of well grown transplanted LARCH, 2 and 3 feet high, which they will sell at a low price, as they must be removed this season. All sorts of Forest-trees, seedling and transplanted, grown extensively, and offered at very moderate prices.

S. GIRLING begs to refer the Readers of the *Gardeners' Chronicle* to his Advertisement of PETUNIAS, SEEDLING VERBENAS, DAHLIAS, &c., of the 12th October. Danecroft Nursery, Stowmarket, Suffolk.

FASTOLFF RASPBERRY.

J. T. WILLMER, Sen., respectfully informs his Friends and the Public that he has a few hundreds of the above Superb RASPBERRY, warranted to be the genuine kind. 100 Canes, 40*s.*; 50 Canes, 20*s.*; and 25 Canes, 12*s.*, including mat and packing.

J. T. W. has likewise a superb collection of CARNATIONS, PICOTEES, PINKS, and AURICULAS on sale, Catalogues of which may be had by post-paid application.

12 pairs first-rate Carnations . . .	£2	0	0
12 ,, ,, Picotees	2	0	0
12 ,, ,, Pinks	0	12	0
12 plants of fine-named Auriculas, including bast and packing	1	0	0

Sunbury, Middlesex, Nov. 13.

FASTOLFF RASPBERRY.

JOHN BELL begs to refer the readers of the *Gardeners' Chronicle* to his Advertisement last week of the above Raspberry, which may also be had true of the following Nurserymen:—Mr. W. CATLEUGH, Hans-place, Chelsea; Mr. W. MOORE, Dereham; Mr. BISHOP, Wacton; and Mr. J. W. NUTTING, Seedsman, 46, Cheapside, London.

Messrs. YOUELL and Co., of the Yarmouth Nursery, having stated in their Advertisement of last week that the Raspberry they call the Fastolff can only be had true of them or their Agents, J. BELL feels bound, in justice to himself and other Nurserymen whom he serves with the above, to state that he has had his Canes the last three seasons from the same persons YOUELL and Co. have had theirs from; and that the above Raspberry is not so exclusive as Messrs. Y. and Co. wish the public to believe, as it is grown in almost every cottage and gentleman's garden at Burlingham, Lingwood, Acle, Rollesby, Ormesby, Hemsby, Filby, and all the adjoining parishes in that part of Norfolk; Ormesby and Filby being the two parishes from which YOUELL and Co., and myself, have had nearly all the stock. J. B. believes the Raspberry first originated in the garden of W. Jary, Esq., Burlingham, from which gentleman's gardeh J. BELL's first canes were procured. The Raspberry is generally known about these parts as the Filby Seedling.

Bracondale Horticultural Establishment, Norwich.

THE FILBY, or FASTOLFF RASPBERRY.—At the request of some gentlemen living in the neighbourhood of Yarmouth, T. RIVERS begs to submit the history of this really excellent Raspberry to the public. In the year 1814 Colonel Lucas, of Filby, a place lying between Norwich and Yarmouth, discovered a Raspberry plant growing under an old Laurel hedge in his garden. His attention was drawn to it, and he soon found it to be a superior and delicious variety, so that in a short time every other sort was ejected from his garden, and this alone cultivated. It was not, however, till 1824 that he allowed his gardener to part with it, who then gave canes to his neighbours, and by this means it got to be cultivated in Caistor, Ormsby, and, in fact, in all the neighbourhood, under the name of the FILBY RASPBERRY, to the exclusion of all other sorts. It has latterly often been called the Caistor Raspberry, from the Market Gardeners growing it in that parish. In Caistor is an old castle in ruins, that formerly belonged to the Fastolff family: the latter name was given to the variety by YOUELL and Co., when they first began to sell the canes. The fruit upon which Dr. LINDLEY pronounced his opinion was gathered in the Filby garden, now the property of the Rev. G. LUCAS, who authorises and permits the publication of the above facts; and has also permitted his Gardener to supply the Canes after this date to T. RIVERS only.

Canes are sold at 30*s.* per 100, or 6*s.* per score, carriage paid to London. Charge for package, for small parcels, 6*d.*, for large do., 1*s.* to 1*s.* 6*d.* Orders to any amount can be executed. The Trade price will be given on application.

Sawbridgeworth, Herts, Nov. 12, 1844.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, GERANIUMS, AURICULAS, CARNATIONS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to recommend to the attention of the Nobility, Gentry, and Public his extensive assortment of the above Flowers, which, from the success he has had in their cultivation, he can offer at very moderate prices. He particularly wishes to call attention to the highly-flattering remarks on his Exhibitions of Tulips and Lilium lancifolium this season, in the various papers. He is also desirous of reminding the Nobility, Gentry, and Amateurs, who may wish to add to their collections or ornament their parterres with these beautiful flowers, that this is the best season to make a selection. The varieties of the splendid Lilium lancifolium are particularly adapted for parterres, as, besides being quite hardy, they flower at a time when the Nobility and Gentry are at their country seats, and when flowers are so much wanted. They only require to be known to be universally cultivated. Catalogues can be forwarded by post on application. Foreign orders executed.

BAGSHOT NURSERY, SURREY.

JOHN WATERER begs to call the attention of the Nobility, Gentry, and Public, to his unlimited collection of AMERICAN PLANTS, which are this season unusually well set with bloom buds, particularly those for forcing, comprising,—Rhododendrons, Kalmias, Azaleas, Andromedas, Ledums, Daphne cneorum, &c. Also those of larger sizes, among which may be had Rhododendron, Catawbiense, and many other fine varieties; Kalmia latifolia, Magnolias, of sorts; Azalea coccinea major, and aurantia, &c., &c., from 3 to 6 feet, which are fine objects for single specimens or borders, being bushy to the ground. J. W. begs to recommend his unrivalled Stock of Cedars of Lebanon, 18 inches to 4 feet; also about 200, 4 to 9 feet, bushy to the ground, very handsome for Lawns; the whole of them warranted to move safely. Also about 6000 Spanish Chesnuts, 4 to 6 feet; 50,000 Larch Firs, 2 to 4 feet; 50,000 Birch, 3 to 4 feet; the whole of which may be had at moderate prices. N.B.—Planting done by contract.

Nursery, Bagshot, Surrey, 3½ miles from Farnborough Station, South Western Railway.

TO THE PLANTERS OF ENGLAND.—TRUE HIGHLAND PINE.

JAMES GRIGOR, NURSERYMAN, Norwich, begs to remind such of the Planters of England as are anxious to enhance the beauty and value of their estates, that he is now sending out plants of this recently introduced and very desirable timber-tree, at the undermentioned prices:—

Single plants, strong and well rooted . .	6*d.* each.
Strong plants, 20 inches high . . .	5*s.* per 100.
Do. 18 ,, . . .	30*s.* per 1000.
Smaller-sized plants . .	from 10*s.* to 20*s.* ,,

For introducing this tree Messrs. GRIGOR, of Elgin and Forres, were awarded several premiums by the Highland and Agricultural Society of Scotland, where it is rapidly superseding the common Pine. In its old age it assumes in a great measure the darksome grandeur of the Cedar of Lebanon, and is therefore invaluable for planting in masses throughout the more prominent parts of distant landscapes. Sir Walter Scott describes it as presenting much of "the bold and contorted figure of the Oak;" and the *Quarterly Review* recommends it as an acquisition to churchyards and cemeteries. It is highly esteemed for all economical purposes, on account of the hardness and durability of its wood.

N.B.—J. G. has for the present disposed of all his potted plants; but as the others have excellent roots, there is no risk in removing them. A supply in pots will be ready in the course of next month.

CEDRUS DEODARA, raised from seeds in the open ground, 10*s.* each. Araucaria imbricata, Pinus excelsa, &c. &c. on reasonable terms.

TO PEAR-GROWERS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, CLARENDON NURSERY, ST. HELIER, JERSEY,

Begs leave to draw the attention of Pear-growers to his new PEAR, named "LANGELIER'S BEURRÉ" of first-rate merit; perfectly melting ripe in January; shape of Napoleon, but larger in size; standard, tree very vigorous; one of the best flavoured Pears known, otherwise it would not be recommended by R. L., as his motive for advertising it is not for the sake of publishing, but for the good of the public in general, to whom he is happy to have the opportunity of rendering himself useful; of which "VON MON LEON LE CLERC" will be a sufficient guarantee, having proved itself as it was represented, and given universal satisfaction. The trees of this Superb New Beurré are small and limited in number, and the price will be 21*s.*; if 6 trees are ordered, 7 will be sent; no discount will be allowed to the trade, and to the trade only will 8 plants be sent for 6; the number is very limited. R. L. also takes this opportunity to state that to this day numbers of "Von Mon Leon Le Clerc" remain unpaid for, consequently none will be sent to unknown correspondents, except for ready cash, or post-office order.

As this is the season for planting, R. L. wishes to draw the attention of the public to his acknowledged unrivalled Collection, of which a List may be had by pre-paid letter, and begs to state that nothing is sent from his Establishment except proved fruit, unless requested. R. L. also wishes to obtain attention to a small quantity of EVERGREEN OAKS, among which will be found a great variety; they are fine and healthy, 2 years old, about 18 inches to 2½ feet high, fit for planting or potting, price 20*s.* per 100. Also, fine KIDNEY POTATOES, superior in flavour and produce to the Ash-leaf; the sample, extra fine, 5*s.* 6*d.* for 34lbs. weight, as not less than that quantity will be sent.

RICH LEAF-MOULD and PEAT-EARTH.—Several acres of valuable Peat-earth and Leaf-mould of a rich quality, to be disposed of. Gentlemen and Nurserymen engaged in the Cultivation of Heaths and American Plants will find the above articles of a very superior kind. They will also be found of great value as dressings upon strong lands.—The Estate is within one mile of the Thames, convenient for water carriage. For full particulars apply to Mr. LAWRENCE, Corn Chandler and Seedsman, No. 18, Piccadilly.

NURSERY STOCK.

RICHARD MITTON, NURSERYMAN, Pontefract, being about to clear off five Acres of Nursery Stock, consisting of Forest and Fruit-trees, Evergreen and Flowering Shrubs, &c., begs to offer the same at unusually low prices. Particulars may be had on application.—Pontefract, Nov. 16.

A SPLENDID NEW AZALEA AND FUCHSIA.

WM. PAWLEY, White Hart Hotel, Bromley, Kent, has now ready for delivery a beautiful and distinct variety of AZALEA, named "Carminator," that gained first prize at the Regent's Park Exhibition, April 30th, 1844; a fine large flower, very dark, good habit, and a free bloomer: established plants, 21*s.* each.

FUCHSIA CASSANDRA.—This beautiful and distinct variety is now ready, at 10*s.* 6*d.* per plant; for particulars, see Professor Lindley's opinion in *Gardeners' Chronicle*, under the initials "H. C.," Sept. 7, p. 608.

N.B.—The usual discount to the Trade, and a remittance from unknown correspondents.

EXHIBITION OF CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, beg to state that their Collection of this beautiful autumnal Flower is now in bloom, and will continue for the next two or three weeks.

C. and Sons are now sending out healthy young plants of Double CAMELLIAS of sorts, with flower-buds, at 30*s.* per dozen; larger plants, 42*s.* per dozen; and young plants of the newer sorts, at 60*s.* per dozen. Package included in the above prices.

EDWARD BECK informs the Public that in consequence of the greatly increased demand for his SLATE TUBS, he is enabled to reduce the price of the following sizes about 10 per cent. He regrets the too frequent delay which has occurred in the execution of orders. This he hopes to avoid in future by keeping a supply on hand.

Present Prices for Cash or Post-office order:—

14 inches . . .	11*s.*	0*d.*	20 inches . . .	22*s.*	6*d.*
15 inches . . .	12	6	22 inches . . .	25	0
16 inches . . .	16	0	24 inches . . .	32	0
18 inches . . .	19	0			

Slate Works, Isleworth, Middlesex.

CARNATIONS AND PICOTEES.

JOHN DICKSON, Acre-lane, Brixton, Surrey, has prepared for the growers of these splendid flowers a Catalogue, enabling them to judge of their qualities, with the prices annexed, which may now be had at the Nursery, and of Messrs. WARNER & WARNER, Cornhill, London.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, HIS GRACE THE DUKE OF MARLBOROUGH, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.: as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL AND CO. beg to announce they are again able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

Packages containing 100 Canes	.	£2	0 0
Ditto „ 50 „	.	1	1 0
Ditto „ 25 „	.	0	12 0

For particulars of the above, see YOUELL & Co.'s Advertisement of Nov. 9th.

YOUELL and Co. feel it due to themselves to state that a spurious kind was offered for sale by other parties last season, under the title of "Fastolff Raspberry," the same having no pretensions to the genuine variety; and to obviate a repetition of the like they have appointed the following Nurserymen and Seedsmen as their Agents for the sale of it, at whose establishments may be seen engravings of the Fruit:—Bury St. Edmunds—Mr. R. Pettit; Canterbury—Mr. W. Masters; Carlisle—Messrs. Little and Ballantyne; Chichester—Messrs. Newman and Co., Cole Vale, near Leek, Staffordshire—Mr. F. Fox; Cork—Messrs. Hovercroft; Doncaster—Mrs. Milan, Seed-shop; Dundee—Messrs. Urquhart and Son; Durham—Messrs. Hancock and Sons; Edinburgh—Messrs. Peter Lawson and Son; Fulham—Messrs. Whitley and Orsborn; Glasgow—Messrs. Drysdale and Co.; Haddington—Mr. T. Dods; Halifax—Mr. W. Throp; Jersey—Mr. B. Saunders; Leeds—Messrs. Ely and Son, Rothwell Haigh; London—Messrs. Flanagan and Son, No. 9, Marlton House-street, and Messrs. Noble, No. 152, Fleet-street; Liverpool—Mr. James Cuthbert, 12, Clayton-square; Manchester—Mr. H. D. Cormack; Nottingham—Mr. J. F. Wood, The Coppice; Peterborough—Mr. John White; Penzance—Mr. J. Fox; Plymouth—Mr. W. E. Rendle; Sheffield—Messrs. Fisher, Holmes, and Co.; Southampton—Mr. James Ingram; Stafford—Mr. J. Sandy; Torquay—Mr. J. Morgan; Wakefield, Mr. W. Barratt; Waterford—Messrs. Fennessey and Son; Westerham, Kent—Mr. I. Cattell; Wexford—Mr. James Harpur; York—Messrs. T. and I. Backhouse.

YOUELL'S CELEBRATED TOBOLSK RHUBARB, the earliest sort known, fine roots, fit for forcing, 12*s.* per dozen. For Particulars, see their Advertisement of Nov. 2.

Finest Imported DUTCH HYACINTHS, 6*s.*, 12*s.*, and 18*s.* per doz.; for Particulars of which, together with the Extensive and Select Collection of CARNATIONS, PICOTEES, and PINKS, see their Advertisement of Nov. 9.

Great Yarmouth Nursery, Nov. 13.

NEW AND SPLENDID RHODODENDRONS.

RHODODENDRON WILLIAMSONII. — This magnificent variety was forwarded for the opinion of Dr. LINDLEY and also of Mr. GLENNY. Dr. LINDLEY (see *Gardeners' Chronicle* for May, 1844)—"*G. B. S.*—Your seedling makes a handsome and showy variety for the garden; the heads of the flowers are large, compact, rich in colour, and the foliage is very handsome." Mr. GLENNY (see *Gardeners' Gazette* for May, 1844—"*G. B. S.*—It hardy, a very great acquisition; size very large, bright rose, well spotted, and if bloomed in the open ground, a valuable addition to our hardy plants, for the foliage is as perfect as the flower."

RHODODENDRON INVICTUM.—A very dazzling deep rosy crimson, very dark spots, a most distinct and superb variety, and blooms later than most of the hybrids, and quite hardy. The above two splendid hardy Rhododendrons now offered to the public were raised by Mr. Williamson, the Curator of the Sheffield Botanic Garden, where INVICTUM has bloomed for several years, and has been the admiration of all who have seen it. Price for the two, 21*s.*

Apply to F. GODWIN, Nursery and Seedsman, Sheffield; W. and A. GODWIN, Market Drayton; or Messrs. WARNER and WARNER, 25, Cornhill, London, where paintings of the above may be seen.

SUPERB DWARF ROSES.

F. GODWIN, having a very large stock of Dwarf Roses, including the most approved varieties of the Hybrid China, Gallica, Provence, Damask, &c., is offering them at the following reduced scale of prices:—

100 selected sorts, in 50 named varieties	.	.	25*s.*
50 do. 25 „	.	.	15*s.*
24 do. 12 „	.	.	8*s.*

The above are strong, healthy plants.

Sheffield, Nov. 12, 1844.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, ARCHITECTS, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally accepted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. WEEKS AND DAY have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

DUTCH HYACINTHS for forcing Single and Double at 4*s.* per dozen; also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones & Ranunculuses; Priced Catalogues of which will be forwarded per post, from ARTHUR COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall.

Double Italian Tuberose roots expected the end of next month.

COTTAM AND HALLEN, ENGINEERS, IRONFOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.

Registered under 6 & 7 Vict., Cap. 65.

No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.		Flue Door.		Damper.		Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ *s.*	*s.*	*s.*	*d.*	*s.*	*d.*	*s.*	*d.*		
10	1 5	20	7	6	6	6	2	6	30 feet.	12 to 20
Ribbed Boiler.										
10	2 2	20	10	6	7	6	2	6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12	6	7	6	3	6	80 to 125 feet.	40 to 65
14	3 10	35	17	5	8	6	4	6	150 to 250 feet.	65 to 100
18	5 5	42	25	0	8	6	5	6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35	0	8	6	7	6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower Stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

CONICAL BOILERS.—The Boilers invented by JOHN ROGERS, Esq., are made of several sizes, and may be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

They may be seen in operation at Messrs. Chandler's, Vauxhall; Loddiges', Hackney; Henderson's, Pine-apple place, Edgware-road; Rollisson's, Tooting; Pontey's, Plymouth; The Horticultural Society's Gardens, Chiswick; and in the Gardens of the Royal Botanical Society, Regent's-park.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by various improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have introduced durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely compact and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery, they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIELD (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5 A, Hawley-road, Kentish Town.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. **To secure to buyers these indispensable** requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street, Fenchurch-street, London.

UNRESERVED SALE OF NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS beg to announce, that the Sale of the VALUABLE NURSERY STOCK, at the Key Field Nursery, St. Albans, Herts, will commence on MONDAY, November 18th, 1844, and two following days, at 11 o'clock each day.—American Nursery, Leytonstone.

TO NURSERYMEN, SEEDSMEN, AND OTHERS.

LAVENDER HILL NURSERY, WANDSWORTH ROAD.

UNRESERVED SALE OF EXTENSIVE NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the late Mr. PAMPLIN, to sell by Public Auction on the premises, Lavender Hill Nursery, Wandsworth-road, near London, on Monday, Dec. 2d, and following days, at 11 o'clock on each day, the whole of the EXTENSIVE and VALUABLE NURSERY STOCK, comprising a large quantity of the finest Hardy Evergreens of all sizes (which remove particularly well out of this ground); Fruit and Forest Trees, Shrubs and American Plants; Hardy Herbaceous Plants; large and small Camellias; a very capital collection of Ferns, some of which are of extreme rarity; Garden Frames and Lights; Shop Fixtures and general Fittings of a Seedshop and Counting-house; Stock of Seeds of the present Harvest; Garden Implements, including useful Carts, Barrows, &c.; several thousand yards of Box Edging; about 200 Pollard Willows with their lop and top; Evergreen and other Hedges; also some growing Crops, as Mangold Wurzel and Turnips; together with many useful articles.

The whole will be sold without the least reserve, the premises having been disposed of for other purposes, and must be cleared before Christmas.

Catalogues will be ready one week prior to the Sale, and may be had on the premises; at most of the Seedshops in London; at No. 45, Frith-street, Soho; and of the Auctioneers, Leytonstone, Essex.

SIX THOUSAND MOSS ROSES.

MR. JOHN KING begs to give notice that he is Instructed to Sell by Auction, on the Premises, Victoria Park, on the 15th November, 1844, at 12 o'clock precisely, by order of Mr. Carter, of Grove Street, Hackney, about 6000 MOSS ROSES, Fruit Trees, a large quantity of Flower Plants, Cucumber Boxes and Lights, Tools, Seeds, Hedges, &c. To be Viewed till the Sale. Catalogues had on the Premises; Three Colts, Grove Street; of Mr. Clark, Seedsman, Bishopsgate Street; and of the Auctioneer, Hackney Road.

TO MARKET GARDENERS, GENTLEMEN'S GARDENERS, AND OTHERS.

TO BE SOLD, a Bargain, within one hour's drive of Covent Garden Market, THE LEASE OF AN EIGHT-ROOMED HOUSE, EXCELLENT OUTBUILDINGS, AND FOUR ACRES OF CAPITAL MARKET-GARDEN GROUND, covered with the choicest Fruit Trees in full bearing. Also, from 5000 to 6000 feet of Glass, that has been erected within the last four years, and heated by hot water. Likewise the Stock and Crop, which consists of upwards of 400 Fruiting Pine plants, nearly 700 succession ditto, several thousand Strawberry plants in pots for forcing, upwards of a Thousand Chillies; several thousand empty pots, tools, leaded cisterns, with every other requisite for carrying on a most profitable Trade. There are 36 years of the Lease unexpired; Rent, 30*l.* per annum. For further particulars apply, personally or by letter, to J. D., Mrs. Lowe's, Grocer, Southgate, Middlesex.

FARM.—Wanted to Purchase, A FARM of 200*l.* to 400*l.* a year rental: it must be south of the river Thames.—Address, by letter, stating size, situation, rent, and price, to E., *Gardeners' Chronicle* Office, 5, Upper Wellington-street, Covent-garden, London.

FOR SALE, an INDIAN BULL, COW, and CALF, and the Cow, which is only thirty-six inches high, again forward in calf.—Apply to Mr. GIDLEY, Langford Budwill, Wellington, Somerset.

THE TRUE FASTOLFF RASPBERRY.

YOUELL AND CO. take the present opportunity to state that the above unequalled Raspberry is to be obtained only at their Nursery or of their Agents, a list of whom appear on the Advertising Sheet of this day's *Gardeners' Chronicle*; and they recommend their friends to be cautious of whom they purchase, as another Raspberry, under the above title, is being substituted by certain parties as the "true variety."

Great Yarmouth Nursery, Nov. 14, 1844.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 16, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Nov. 20	Society of Arts	8 P.M.
SATURDAY, Nov. 23	Royal Botanic	4 P.M.
FRIDAY, Nov. 29	Botanical	8 P.M.

To the appeal we lately made to our readers for their experiments upon POTATOES during the past season, we have received replies from some valuable correspondents, especially Mr. Grey, of Dilston, and the Rev. Geo. Rous. These we shall publish before long; but we again take the liberty of mentioning the subject, and repeating our earnest request that details of experiments may be forwarded to us. We are sure that their value will be much increased, if, instead of being published independently of each other, they are brought into one point of view; for so they are most likely to be productive of public benefit.

As this is a good time of the year for SOWING TULIP SEED, and as we believe that a larger quantity than usual has been saved this season, we shall extract at length from our Paris friend his fifth chapter, entitled "*Mode de Propagation.*"

"Tulips," says he, "are obtained in two different ways—by seed and by offsets. It is ascertained by experience, that any given variety of Tulip will not reproduce itself by its seeds, but, on the contrary, many will be originated, differing wholly from each other, thus giving amateurs an opportunity of raising new and improved sorts, which they term 'Breeders.'

"To accomplish this with a greater degree of certainty, they increase their chances of success by only sowing seed of first-rate varieties, and especially those the bottom of whose petal is of unsullied purity; as I find that Breeders thus originated sooner develop their proper colours than those which are the produce of inferior sorts.

"When the ripeness of the Tulip seed, where the flower has bloomed in a full exposure, is indicated by the opening of the capsule, it is cut off a few inches below the head, and placed in a very dry situation, in order to insure its perfect maturity. This being accomplished, the seeds are taken out, and should be sown about the middle of October in a bed of well-prepared earth, which has been passed through a coarse sieve, and covered about the eighth of an inch in depth with soil of a fine and light texture, which will allow the free vegetation of the seeds, without incrusting or becoming hard. The beds must be protected from sharp frosts by covering them with leaves, or with mats, and likewise kept perfectly free from weeds. If these necessary precautions are attended to, the Tulips will come up towards the end of February. From the size of a small Pea, in the first year, the roots will increase considerably during the two following seasons; and each time, when the leaves fade, I spread over my seedlings about an inch in thickness of similarly prepared soil to that with which the seed was covered, being satisfied that (from the loss of time, and the greater extent of land they will occupy, by taking them up in the second year, and replanting them) it is the better plan to allow them to remain till they have made their third growth. I do not take up mine until that time, and, in a few days afterwards, I replant them about two or three inches in depth, and about three inches apart from each other, in a well-prepared bed. Lastly, in every succeeding year, I set them in fresh soil, being convinced that they attain their full size much sooner when treated in this manner; especially if sand has been mixed with it, or lime-rubbish which has been enriched with good rotten manure, or vegetable soil.

"Whatever care may be taken in the choice of seed, few perfect flowers will be obtained on their first blooming, which will probably be in the fifth year. During each year afterwards, there may appear a few choice sorts, according to the goodness of the flowers from which the seed was gathered, and the suitableness of the soil. Their improvement is also gradual, as the colours or markings, which were at first confused and undecided, will, after a time, assume their proper character, and attain all the perfection of which they are susceptible."

Here we are at issue. As far as our experience goes we like to have flowers *break from the breeder*, (or become variegated), in *fine style at first*. For the florist who has once seen a Tulip in a clean state, lives in hope that, although uncertain, it may come so again; and we know of very few instances indeed, where the flower alters for the better, after having broken indifferently. We will take Polyphemus for instance, with its numerous aliases, and we may certainly defy a bad break or strain to "*come well*," as we florists say; or, to render ourselves intelligible, a bulb of an inferior degree of quality, or one that did not assume its proper character when first it changed its colour from the self or breeder state, will seldom, if ever, produce a good or first-rate flower.

Nine-tenths of the disappointments experienced by Tulip-growers arise from getting bad strains of any particular sort. It is very certain that they may get a flower broken from the same breeder as their neighbour, but while he is successful in obtaining good and well-marked blooms, they may never be able to flower it fit to be seen, and, in fact, it will bear no comparison with the other. Getting fine strains or good breaks is the grand secret in Tulip-growing. Thus we have Brulante éclatante, and Beteral's Brulante éclatante, the last immeasurably superior to the former; also Ponceau tres Blanc, and Dutch Ponceau tres blanc, the latter a finer strain than the other. Again: Sir Sidney Smith, a feathered bizarre, is called Magnum Bonum, when from a clean break; and many others might be adduced to illustrate our position. We have seen and grown French Tulips, said to be very fine sorts, but really we must have grown them many years (if they do alter for the better) before they would have reached our standard of a fine flower.

In continuation, "From their first flowering, all those with bad shaped cups are discarded, also those with indented petals, or that are tinged with yellow; and a weak bending stem is considered a serious defect.

"After the petals have fallen, the heads or capsules are cut off in order to strengthen the roots, which otherwise would be uselessly weakened by ripening their seeds."

"The side bulbs always reproduce flowers identical with those from which they derived their origin. Their period of blooming varies according to their size; it occasionally happens in the first year, and sometimes it will take six or seven years' growth before they flower. During the month of August, the bed must be prepared for their reception, and in September they must be planted from two to three or four inches apart, according to their size. Should their planting be deferred till November, it is very possible that many of the smaller ones will shrivel up and perish. When they are put into the ground or taken up, the same system is followed as in the main collection, so that all mistakes may be avoided, and by that means the amateur will be able to replace any bulbs which by accident or otherwise he may have lost in his choice or best beds."—*W.*

These directions, which are purely practical, and divested by the author of all theory, nevertheless, like all good cultivation, are entirely conformable to the laws of Vegetable Physiology. The same mode of management applies to all bulbs which naturally inhabit countries considerably warmer than our own; and, if it were applied to them with the skill and patience of a Tulip-grower, would have prevented the loss of many fine things, obtained at great cost, and of surpassing beauty, such, for instance, as the whole race of Calochortus.

TRAINING FOREST-TREES.

I OBSERVE in the *Chronicle* of Sept. 28, a successful refutation of what Dr. Thackeray does not recommend or practise respecting the training of forest trees. Mr. Billington states him to entertain the notion that "divesting a tree of its side-branches increases the weight or bulk of the timber in the trunk." Dr. Thackeray's system is not to divest the tree of its side-branches. That was the old plan, which lopped off all the side-branches, leaving a little bushy head, which was thereby encouraged to diverge into several branches of equal thickness; on the contrary, he selects a single stem as the leader, and gradually takes off such large branches as may interfere with and rival it. Mr. Billington next states that in a former Treatise he has "shown, beyond a doubt, that Larches with numerous healthy branches and leaves increase in girth upwards of two inches annually; and that those having diseased leaves and only a few branches increase very little." If the leaves be unhealthy the tree must be unhealthy; and who ever doubted that a healthy tree would increase faster than an unhealthy one? Mr. Billington then says that "lopping off branches as they are produced, or too soon afterwards, makes trees tall, weak, puny things." Who doubts this? Not Dr. Thackeray; for he never proposed to lop them off "as soon as produced," nor very soon afterwards, unless they appeared likely to detract from or rival the head or leader. Nor can any one doubt that lopping "too soon" is bad; but what is "too soon?" that is just the point in question. If Mr. Billington's sole object be the promotion of truth—the establishing of the best system—(and I have no reason to suppose the contrary), I would venture to suggest that the best way of obtaining this object is to examine carefully and state candidly the plans and reasons objected to. I adopted, ten years ago, the Thackeray system in some remnants of ancient forest, and in my hedgerow timber, at Wood Walton and Westow, in the county of Huntingdon. The trees in the former, some growing from old stools, some self-sown, are thinned periodically when the underwood is cut. Most of the older trees I have found separated into many branches, none of which deserve the name of timber, and leaving a very short trunk, which is saleable. Experience as yet cannot show a decisive result; but those trees which have been trained on the Thackeray plan present the appearance of a longer and stouter stem than others of the same age formerly did. The advantage as to hedgerow timber seems still greater. The old trees having nothing to restrain them, have formed, at about half the timber height, an umbrageous top, doing far more annual damage to the land, especially if it be arable, than their growth can compensate. For this reason I have cut down several not wanted for shade to cattle, which, if they had been trained on a different plan, might advantageously have remained. I visited Dr. Thackeray's Flintshire woods twice in 1836, and again in last September. Their appearance fully confirmed the favourable opinion which I had formed. In one respect I differ from him—in thinking it better to finish the pruning in July, or if practicable in June, as the bark will then have time to cicatrise, and in some degree grow over the wounded trunk.—*George Pryme, Cambridge.*

THE NERQUIS PLANTATIONS.

IN a recent Number of the *Gardeners' Chronicle* these plantations form the subject of a lengthened article, written by Mr. Billington, near Oswestry. As a practical forester, and as one who has had frequent opportunities of inspecting Dr. Thackeray's plantations, I trust I may be excused for taking part in a discussion of which the article in question has been the origin.

Mr. B. has an unquestionable right to assert the superiority of his favourite theory over anything else of the kind yet submitted to the public; but this theory must have something more to support it than mere assertion; and the outspeaking merits of the system of pruning and thinning practised in Dr. T.'s plantations has of late been well attested by highly competent authorities. I have, within these few days, gone through and minutely inspected the Nerquis plantations. Like Mr. B. "I saw much to admire and praise." "The greater part of the Larches are really 'good,' and there are certainly some fine Oak and Ash trees." Mr. B. very justly observes, "that what is spent in forming large branches may by art be made to form valuable timber in an elongated trunk," and that "it is clear that we may regulate by skill and art the increase of the girth and elongation of the trunks to almost any proportions we please" I most cordially join Mr. B. in his "protest against the non-pruning advocates;" and I think with him, that "Dr. T.'s system of pruning is tolerably correct;" but I trust to be excused for saying that I cannot consistently follow Mr. B., when he tells us that "Dr. T.'s system is erroneous, and apt to establish a mode of pruning wholly opposed to the true means of increasing useful and valuable timber;" or when he says that the greater part of the trees at Nerquis are only fit for poles, rails, ladders, and such like purposes. Mr. B. admits that the Larches are good. Now, if we compare the girths of the Larch and Oak specimens given in his own report, the proportion which they bear to each other (Larch 3 feet 2 inches, Oak 1 foot 7 inches) is not far from what is usual and common. As might be expected, Mr. B.'s measurements partake largely of the general character of his report, and ought to be viewed accordingly. My visit to Nerquis having been subsequent to the appearance of Mr. B.'s observations, my inspection was very naturally directed to the examination of such points as seemed most to engage Mr. B.'s attention.

As regards the effect of the method of pruning practised in Dr. T.'s woods, no unprejudiced person, capable of judging, can have but one opinion; and I speak guardedly when I say, that these plantations afford a more convincing proof of the advantages resulting from a systematic mode of training, than is often to be met with. They are undeniably the finest in NORTH WALES—soil, situation, and climate considered. The Oak and Ash trees, instead of showing signs of having been injured by the Larches, are, on the contrary, in a very thriving condition, having wide-spreading, lofty tops—a sure indication of vigour of growth. These observations do not well accord with Mr. B.'s description of matters. In that part of the plantation from which (as I was informed by Dr. T.'s wood-forester) Mr. B. selected his specimens, I measured off a rectangular plot of ground, 35 yards by 24, where the trees seemed to be of an average size; the total number of trees upon this piece of ground was 37, viz. 7 Larches, the circumferences of which, taken at 4 feet from the base of the trunks were 46, 44, 46, 45, 40, 44, and 40 inches respectively; 7 ditto from 36 to 38 inches in girth, at 4 feet from the base; 6 Oak trees, the circumference of which, taken at the same height, were 28, 26, 24, 22, 21, and 24 inches respectively; 4 Sycamore trees, average girth at 4 feet from the ground, about 24 inches, and 13 smaller-sized trees of various kinds. So much for the "unmerciful" pruning.

Mr. Spencer, a subsequent writer on the subject, says, at page 716, "Admitting that the trees in Nerquis plantations are fine specimens of growth, does it not follow that their vigour is solely attributable to the pruning they have had?—Certainly not." According to Mr. Spencer, the mode of culture practised at Nerquis is founded on mistaken notions of the principles of vegetable economy. If so, I presume we have no alternative but to attribute the success attending their growth to

natural advantages. Now, if the circumstance of being situated partly on the northern brow, and partly on the summit of a bleak high mountain, where the soil consists of from 2½ to 3 inches of black bog or peat, constitutes natural advantages, certainly the woods at Nerquis possess such advantages in no ordinary degree; perhaps the diminutive and ill-thriving plantations which join them in many parts ought to be regarded as a further proof of the natural advantages which they possess. If their vigour of growth be not chiefly owing to the training which they have had, I confess I see no other rational way of accounting for it. There being no plantations anywhere near Dr. T.'s managed after the method advocated by Mr. B., I cannot speak to its effects in a comparative point of view; yet, from what is known of its tendencies, I feel warranted in saying, that if it had been adopted at Nerquis, the results would not have been quite so satisfactory.

Notwithstanding Mr. B.'s "protest against the non-pruning advocates," he agrees with them in first principles; and, indeed, most of his arguments go to support their views. Both parties seem to think that trees are supported chiefly from the atmosphere, through the agency of the leaves and branches, and that the vigour and growth of a tree is in proportion to the number of its side branches, and amount of its foliage. That foliage is essential to the healthy exercise of the vegetable functions, there cannot be a doubt; and care should be taken to preserve as much of it as is consistent with the purposes of artificial training; but it is opposed to all experience to maintain that the increase of timber in the trunk is best promoted by having a tree loaded with side-branches, or, as Mr. B. seems to think preferable, studded with spurs. One of the arguments used by Mr. B. in advocating such doctrines is, "that if you cut down a tree having numerous branches on one side, it will be seen that the concentric annual rings are much wider on the side having the numerous branches than on the other." Supposing such to be the case, it by no means follows that the side having the branches contains the greatest quantity of useful timber; for in such cases the apparent increase of timber is just the effect of the interruption of the continuity of the vegetable circulation, caused by the side-branches, and proves most effectually the error of Mr. B.'s system; for be it observed, that what he would pass off for good timber is just the ends of the branches, their twisted fibres forming, as it were, knots, or distinct masses of wood within the body of the trunk, and rendering it unfit for many purposes of carpentry. I think, then, there can be no advantage in any enlargement of the concentric annual layers, when produced by such means as I have described; and I feel pretty confident that those who have had most experience in converting timber will bear me out when I say that, in nine cases out of ten, that side of the tree on which there has been fewest branches will be found to contain most good timber. In the artificial culture of wood the mere increase of timber is not the end in view. Fineness of quality is incompatible with great rapidity of growth; indeed, everybody knows that rapid growth produces coarseness of texture, and *vice versâ*. Therefore, in judging of the merits of a particular method of training young plantations, by an inspection of results, our opinions must not be founded altogether on the actual quantity of timber in the trees; while keeping in view vigour of growth, we must be satisfied that the means employed have been such as to produce that form of trunk which will, when it reaches maturity, yield the greatest return in the shape of clean sound timber of firm texture.

The method of pruning by the fore-shortening of the lateral branches cannot, with any degree of propriety, be applied to the more valuable kinds of hard wood; for, in wood of this description, the natural tendency of fore-shortening is to give to the branch or limb so treated the character and disposition of the parent stem, and consequently a capacity for forming what is termed heart-wood; and it is well known that the twisting of the fibres produced by the side-branches is much greater in the case of branches containing heart-wood than in the case of those that have not reached to such an advanced stage of growth. Another circumstance worthy of notice is, that this twisting of the fibres, so injurious to the texture of the timber, begins where the branch originated, and not at its surface. How improper, then, to follow a method of uniformly fore-shortening branches intended to be eventually taken off close to the trunk, and how necessary to remove superfluous shoots at an early stage of their growth!

The main object in pruning a tree is to give a proper direction to its growth; and as the greater part of the useful timber is contained in the body of the tree, we ought to endeavour to produce as great a length of trunk, in proportion to the branched top, as the habits of the tree will admit of. In short, to give to the tree that form which is most conducive to utility. That this may be effected by a judicious method of training, the results at Nerquis most distinctly prove. Mr. B.'s report would induce a belief that Dr. T.'s woods have been mutilated by excessive pruning; but I would mention, and can be borne out in the statement, that there is not the slightest appearance of anything having been overdone, and there is good reason to believe that the whole operations have been conducted with much caution, much care, and perhaps some niggardly-minded persons might be inclined to say, *with no little cost*. It has sometimes occurred to me that the very great nicety of method which characterises every department of the management at Nerquis gives rise to the opinion which we sometimes hear expressed (by such as have been accustomed to range slovenly and much neglected plantations) as to things being overdone.

There is one other point in Mr. B.'s report which deserves notice. Mr. B. appears to imagine that the trees at Nerquis have suffered greatly from the want of proper thinning. To form a correct opinion as to the extent to which this operation ought to be carried, reference must be had to the situation of the woods. Although Dr. T.'s woods are much more open and airy than any others in the same part of the country, yet to a person who has had but limited means of observation, or at least whose experience has been confined to the rearing of timber on fertile plains and sheltered valleys, they may appear to be too thick. On the other hand, those who have experienced the mischief done by the autumnal winds, where the soil is light and the plantations much exposed, might think that the woods at Nerquis have been thinned out to a greater extent than their exposed situation seems to warrant. My own opinion is, that Dr. T. has nothing to regret on this head.

Mr. B. refers to a plantation belonging to W. O. Gore, Esq., M.P., in which it seems there is a noble Larch girthing at 4 feet from the ground 61 inches. We are told it was planted about 40 years ago, that "it has had no pruning, but never was crowded." To meet this fact, which Mr. B. holds to be quite sufficient to show what might be accomplished by "proper management" — in a plantation at Craiglelo, near Ruthin, planted by Dr. T., and pruned according to the system practised at Nerquis, there are several such noble Larches; and although planted only 38 years ago, some of them girth at 4 feet from the ground 65 inches, and are from 65 to 70 feet in height. How justly might I too say, "This shows what may be done by proper management!"—*T. S. G., Flintshire.*

DISEASES OF PLANTS.—No. VI.

[Fungi.]

The subject of Galls belongs to Entomology, and a great variety have been figured in this Paper and traced home to their actual causes. It is mentioned here also because the forms, in many instances, have so close a resemblance to Fungi, and have been referred to them even by good botanists on a hasty and superficial inspection. For here, as in other branches of the creation, we observe somewhat of that wonderful analogy by which, in each distinct class or even division of natural productions, the same or extremely similar forms are repeated though accompanied by an organisation totally different; and it is this amongst other circumstances which makes it so absolutely necessary to examine into the intimate structure of the works of the creation, before venturing to pronounce upon their proper place in the system. In the case of Galls it is but a superficial examination which can possibly deceive, for even where the little grub which produced them has vanished, the total absence of all parts of fructification will at once decide the point. If, for instance, the cup-shaped Gall, which is so common on Oak leaves, be the object in question, any one who has once examined the hymenium of a Peziza, and observed the fructifying cells arranged vertically like the pile of velvet, with their row of eight mostly elliptic sporidia, cannot for a moment be deceived. One of the most puzzling Galls I have ever seen was sent by Mr. Macleay, from Cuba, on the leaf of some plant of the natural order Ochnaceæ, and has been figured in the "Transactions of the Linnean Society." In this case there is not merely an extraordinary development of the external cellular tissue, but the Gall is formed within the substance of the leaf, and after a time bursts through the cuticle and presents a little ovate body with a crenate border, and within this an operculum which is perforated, or at least apparently perforated in the centre, so as to present a very close resemblance to some strange parasite. And, as if to make the resemblance to some Fungus more close, the Gall appears to make an abortive attempt to penetrate the opposite surface of the leaf, almost exactly in the way which is observable in the curious production which is sometimes so injurious to Pear-trees. But even in this case, where there is no trace of the inclosed grub or pupa, the texture of the walls of the Gall is so different from that of Fungi that it can scarcely deceive, on any moderately accurate examination.

There is a class of productions which, though not actually Galls, require a moment's notice here. They are indeed very nearly of the same nature with those mentioned in the foregoing article. I mean the curled spots which are so common on plants when attacked by the smother-fly; as, for instance, in the Red Currant and the Peach. It is probable, indeed, that all of these are not caused by the presence of the insect, but that the insect is attracted to them especially by the greater tenderness and juiciness of the tissue in those parts. Certain it is, that in the Peach the curled leaves, abounding in juice from the extreme development of the cellular tissue, exist in immense numbers on certain trees, before the slightest trace of the aphis is visible. This is a subject of much interest, and would amply repay an extended series of accurate observations. Of a somewhat similar nature are the rough spots which are so common on Pear-leaves, on the Mountain Ash, &c., and which sometimes appear on the Vine. I have never, however, examined leaves so affected, without finding some minute species of Acarus in their company.

There is yet another production, referred to Fungi by Bernhardi, and after him by Fries and others, which, however, is probably to be regarded neither as a disease nor parasite. I allude to the tuberous bodies so common on the roots of leguminous plants. Their exact nature and use at present is not known; but a Memoir on them has been prepared some time by M. Desmaziéres. They appear a very few days after the germination of the seeds, and are accompanied by a little bed of vessels, in which they are nestled. At an early stage of growth, the contents of their cells become blue, when treated by iodine, which is not the case when their pulpy contents have acquired a salmon-coloured hue, when in some cases the granules are simple and oblong, in others forked. There can be little doubt that they are of some importance to the plant, though they are not, like common tubers, destined for the reproduction of the species, as they pass through the phases of vegetation in a short time, and soon become ruptured and discharge their contents. No insect has ever been observed in them, nor indeed does it at all appear that they are of the nature of Galls. It is probable that in very dry situations, and in time of drought, the nutriment collected in them is serviceable to the plant; but this is very doubtful.—*M. J. B.*

ENTOMOLOGY.

Bibio Marci (*St. Mark's Fly.*)—The larvæ of this, and of many other allied species of flies, are so frequently transmitted to us as mischievous inhabitants of the garden, that I am induced to believe their history will not be unacceptable. These larvæ are generally gregarious, living in large groups of a hundred or more, in Strawberry-beds, Vine borders, flower-pots and similar undisturbed spots, feeding upon the roots and sometimes destroying the entire plant. Bouché says they completely demolished his bed of Ranunculuses for several successive years, by eating up the tubers. The larva (fig. 1) was found, with others, in a Strawberry-bed in October; it is of a dark-brown colour, somewhat cylindrical, the belly flattened, moderately broad, and nearly linear; the head is comparatively small, deep brown, sometimes of a chesnut colour and very shining; the segments are divided into three narrow fillets, the second of which bears a transverse row of short ochreous spines, with a longer curved one on each side near the spiracles; the two last segments are sometimes dull ochreous, the penultimate one being armed with six longish curved spines, and the apical one with four equally long, and a large spiracle on either side. It has no feet; the mouth is furnished with tridentate jaws, articulated palpi, lips, and maxilla.

It is in rotten dung, especially of cows, that these larvæ seem to delight, and they perforate the earth in every direction, their burrows making a honey-comb of the soil. When they are full fed, and about three quarters of an inch long, they change to pupæ, generally towards the end of March; these are of a pale ochreous colour, the head being brighter; the face is heart-shaped, and the short brown curved antennæ are very distinctly seen, and look like eyes; the thorax is very gibbose; the abdomen is cylindrical, with a conical apex terminated by two little spines (fig. 2). In this state they remain from three to five weeks, the males making their appearance first towards the end of April, and the females the beginning of May.

The sexes of the fly, which I will now describe, are very dissimilar, as they are throughout the genus Bibio, not merely in size, but the head of the males is totally different in form as well as being very much larger; the wings are always very much lighter and smaller than those of the female, as well as the abdomen. The species before us was named Tipula Marci by Linnæus, but it is now better known as the Bibio Marci: the male is black, shining, and clothed with long soft hairs; head and eyes large, the latter very hairy, and covering the head, with three little ocelli on an eminence near the base; antennæ short, drooping, and composed of nine joints;* thorax globose; scutel semi-orbicular; abdomen long, not stouter than the thorax, tapering, the apex obtuse and armed with forceps; legs long, especially the hinder; anterior tibiæ very short, mucronated externally with a minute spine on the inside, the others spurred: intermediate slender; hinder long as well as the thighs, broad and compressed; anterior tarsi very long, all 5-jointed, and terminated by minute claws and pulvilli; wings incumbent in repose, very white and transparent, but iridescent; costal margin brown: the stigma and surrounding nervures brown also, the other

* For dissections, see Curtis's Brit. Ent. pl. 139, and for the species the Guide, Genus 1179.

nervures scarcely visible; halters long and capitate; length four and a half lines; breadth nine. Female larger and darker; head very small and oval, not half the breadth of the thorax; eyes small, lateral and remote: ocelli similar to the male; thorax large and oval; collar distinct; abdomen large, broader than the thorax, narrowed at the base, the apex trigonate, with two little nipples; wings very ample, fuscous; the costal nervures and stigma darker, as in the male; legs stout; hinder the longest; anterior thighs inflated; in other respects the legs are similar to those of the male; length six lines, breadth 13 (fig. 3).

The female lays her eggs in the earth, and in the dung of horses and cows in May; they do not hatch until August; it may therefore be presumed that they are feeding at least seven months, viz., until the following spring. During May the flowers in the fields and meadows around London swarm with the Bibio hortulanus, and about the same period the fruit-trees in our gardens, and even the streets of the metropolis, are frequently visited by multitudes of the large and sombre-coloured Bibio Marci, whose flight is heavy and very peculiar in the males, the body hanging down, the long hind legs being stretched out like a heron. The larvæ seem to require a great deal of moisture, for they soon die if taken from the soil they inhabit.

Bouché says the best remedy against these larvæ is hand-picking, which is not attended with any difficulty, for the localities they inhabit are readily discovered in the spring, by the fine earth which is turned up where they live in society. He cleared his Ranunculus-beds of them eventually, by changing the earth in the autumn, and bringing in fresh which was free from the larvæ, and this annual renewal of the earth seems to be a sensible and easy remedy.—*Ruricola.*

Home Correspondence.

Pruning Timber-trees.—Without any previous conversation on the subject, likely to bias the opinion of an old timber-merchant of Sussex, the question was put to him of how he would prune an Oak? His answer was, "Not at all; rely upon it, no tree puts forth a useless shoot till you begin to meddle with it." In farther observations, he went on to say, that you might keep a clean stem whilst the tree was young, so that you did not interfere with his top; but that afterwards, if you pruned, you hindered his growth, and made his timber *doated* (unsound or filled with rotten knots). This person resides in one of the well-wooded parts of Sussex, and has had ample means of observing the growth of the commodity he deals in. It may be observed of the coppice Oak of Sussex, that in the sapling state it is very much overgrown by underwood (Hazel, Ash and hedge Oak), and so pushed up with long and slender stems, which speedily acquire strength, when freed of that incumbrance by periodical cuttings, and, if allowed fair play, soon overtops, and eventually overshadows and destroys the underwood. In this way the best carpenter's timber is produced; that is, long and straight stems. In the periodical cuttings above spoken of, a straggling low branch on a sapling is sometimes struck off by the faggot-maker, but no other pruning is practised. The same is done with the tillars or tellows (young Oak) of hedges and hedgerows; but here larger and shorter stems are produced by the free and unincumbered growth of the branches, and the result is the best ship timber, of which much is cut into plank before it is sent off. Very little Fir is grown in Sussex for economical purposes, except in a narrow strip of country in the central parts of the county. Here the trees seem to do best when left to themselves, only having their stems cleared of branches as they die off in the shadow of the overgrowing tops, so that the wounds may close in before the knots become rotten. It may be mentioned incidentally that, not of late, but it is almost within the memory of man, the lop and top of a broke of timber in the west of Sussex has been known to sell for more than the timber itself.—*P. P.* [We particularly commend this statement to the consideration of timber-pruners. Like all the statements of our excellent correspondent, it is full of good sense.]

Pruning Forest-trees.—In reply to "C. C. L. D.," of the Wicklow mountains, who, if I understand rightly, considers me a convert to Mr. Billington's opinions, I would mention that this is not the case. Mr. B. has never, by anything of his which I have read, induced me to change or modify any opinion I previously held. It may be quite true that I hold some opinions in common with Mr. B., but they were not certainly induced by his writings. Again, "C. C. L. D." misapprehends me when he says, "I desire no better authority than Mr. Billington." It is true I used that expression, but it referred merely to Mr. B., as a reporter of the real state and management of the Nerquis plantations, and nothing more. I considered him a competent, honest, and experienced reporter, and such was the ground of my confidence in the accuracy of his testimony. As the Nerquis Plantations appear to have been visited by gentlemen from various parts of the kingdom, I would invite such as choose, to make their opinions known through the medium of the *Chronicle.*—*Quercus.*

Chrysanthemums.—If these are now watered with liquid guano they will furnish splendid heads of flowers. I have some under the above regimen which are flourishing amazingly, many of the flowers measuring three inches across and nine inches in circumference, and these in bunches, not in single blooms.—*G. J. H.*

Hyacinths.—In cultivating these, prepare the four following soils in equal proportions, viz., loam, peat, rotten manure, and leaf mould; let them be well incorporated together. Procure deep bulb pots, and place some broken potsherds over the hole, on which put some rough peat broken in pieces; fill the pots with the compost to within three inches of the top, and put the bulb on a little house sand, then completely cover it over with the same, which will keep the bulb clean and in a uniform state as regards moisture, filling up the pot with the compost. Water it with a fine-rosed watering-pot. Let them stand till they get pretty dry, then plunge the pots over in cinder-ashes or sawdust anywhere under cover for a month; at the expiration of that time they will begin to push through; they may then be exposed to the light and air, and as they advance in growth water them with guano, which will cause strong flower-stems to be thrown up, and add greatly to their brilliancy of colour. After flowering they may be planted out in the open ground, in an airy situation, and the leaves allowed to die off gradually; then taken up and kept in a cool dry place. Treated in this way, they will flower every year.—*Flora.*

Destruction of Red-Spider, Thrip, &c.—"Delta," at p. 749, mentions the circumstance of a Paper having been read before the Horticultural Society of London, Aug. 2, 1837, respecting Laurel-leaves being used, when bruised, for destroying these pests. As a practical man I can speak from experience on this subject. Being in the habit of growing Melons and Cucumbers rather extensively for some years, of course I have been troubled with these insects as well as my brother gardeners, and this year rather more than usual. The method that I have adopted for many years for killing the red-spider, thrip, and green-fly, is as follows:—When the plants appear attacked with these insects, I get a quantity of Laurel bruised, and put it into the frame or frames, as it may be, about 3 o'clock P.M. It should be dispersed all over the frame, but by no means allowed to touch the leaves of the plants—for, if you do, it is sure to affect them very materially; then shut down the lights as closely as you possibly can; and should the sun be very fervent at the time, I always throw a single mat over the frame, in order to prevent the leaves of the plants from being burnt. The heat to which I allow the frame to rise is from 90° to 100°; never allow it to rise above that point, or you will be sure to lose plants, crop, and all. The length of time that I allow this heat to remain in the frame is two hours only; this time may perhaps appear short, but such is the fact. About 6 o'clock the mat is taken off, and a little more air is admitted to the plants. On the next morning, the Laurel is all taken out, and the plants are well syringed with warm water, and of course shaded during the day. I am certain that, by the evening of the second day, there is not the slightest appearance of thrip or spider. If "Delta" will try this plan, he may be sure of success.—*Devoniensis.*

Glout Morceau Pear.—"R. T." in his description of this Pear, (p. 716), suggests that the meaning of the word "Glout" may be explained by the synonym "Goulu," which he says "was recently observed in the Catalogue of M. Henrard, of Liège." "Pois Goulus," according to Chambaud, "signifies Sugar-peas, Honey-peas. The Pear in question may be accordingly termed a sugared or honied morsel." Now the only signification of Pois Goulus in the Dictionary of the Academy is, "Peas of which the shell or husk is eaten, because it is tender, and has not that small hard interior membrane which is found in other husks." If, therefore, Glout is to be considered the same as Goulu, may not the Pear in question have been so named from the extreme fineness of the skin, which may be eaten more easily than the skin of most Pears? The Dictionary of the Academy gives no other signification to the word "Goulu" than "Gluttonous," and it is, I apprehend, applied in that sense to the above-named Peas, as the eating shells and all has doubtless rather a greedy appearance.—*Guichenet.*

Botanical Lectures, &c.—In Hogarth's Works, published in 1808, by Longman and Co., and edited by Nicholls and Steevens, I observe the following notice in a note at p. 348, vol i., under the date 1762:—"That Dr. Morell, Curate of Kew, Twickenham, &c., preached, for several years, the Botanical Lecture at Shoreditch Church." Did you ever hear of this lecture, or can you inform me whether it is still delivered? If a sum of money has been left for such a purpose, and it has been diverted to another, perhaps it might be possible to recover it, and use it according to the donor's intention. Such a lecture would now be very gratifying to many, though want of encouragement no doubt was the cause of its dying away. Can you likewise inform me if the Boyle Lectures are still delivered, and in what place? In competent hands these likewise might be made very interesting and acceptable. —*T. G. H.*

Cabul Melons.—I quite agree with Mr. Fleming with regard to the Hoosainee and Cabul Melons. I observed at the time at which Mr. Cuthill's advertisement appeared in the *Chronicle*, that he took the Hoosainee to be the Cabul, or rather the Trentham Hoosainee to be that variety. With respect to the Trentham Hoosainee, of which Mr. Fleming is proud, I have little to say; but this I well know, it as he says it is a free bearer and exquisite in flavour, it is the first hybrid that ever was of any use. I wish to be properly understood: if it is a good hybrid Melon it is one of the first that ever was really good. We too often find Persian Melons hybrids in this country, and that to the utter ruin of sorts. The kinds that Mr. Fleming chose for his parent plants are both good when well grown; still, strange as it may appear, they seldom or ever produce good hybrids, however careful one may be in performing the operation of hybridising: this I have proved. I have known many gardeners to have produced what they call their hybrids; and what are they? Any thing but good. I am fully convinced that the flavour of a Melon depends much on the cultivation, or the cultivator, if he is in possession of good and true sorts. I have known seeds to be given to two gardeners out of the same packet, of the true Ispahan Melon, sent to me direct from the city of Ispahan in Persia, from which I believe it takes its name: the produce of one was very similar to that of the Vegetable Marrow; and the produce of the other was fine Melons from 6 to 8 lbs. in weight, and of a most excellent flavour. This cannot always be said of hybrids, but quite the reverse; they are more like the former, Vegetable Marrow, however good the treatment may have been. I have grown the Hoosainee, (but not Mr. Fleming's Hoosainee) the original one: it is a good bearer, and as hardy as most of the Persian sorts, excepting the Germek. I have grown a hybrid between the Ispahan and the Green Hoosainee, which turned out to be very little better than one of the old useless kinds. I may mention that I have also grown the Cabul Melon in question for the last five years, seeds of which were sent to me by a friend in India: it is a very delicious Melon, thickly netted, and possessing a sweet melting flesh. Last season I grew 18 good fruit, the produce of a first crop, in a 3-light box, and 19 of a second crop; thus making in all 37 good Melons from 6 plants. This Melon has one great advantage over many others, viz., the good property of keeping for a length of time after being cut: I have known it to keep good for 5 or 6 weeks. On the 19th November last year I sent the last fruit to table.—*W. M'Donald, King's Road, Chelsea.*

Almonds.—It is not generally known that the Almond (*Amygdalus communis*) ripens in this country, and in favourable summers, such as our last, produces a large crop of well-ripened fruit, which makes a very nice addition to the dessert during winter; they should be gathered in November, stript of their outer shells, and laid out to dry for about three weeks, or placed on shelves in the fruit-room; afterwards let them be kept in very dry sand, and used as they are wanted. They must not be left in a damp place, as they speedily lose their aromatic flavour, and decay in our moist climate.—*J. R.*

Fuchsias.—Perhaps it may not be generally known that at this season, when Fuchsias have done flowering, if the strong shoots are divested of their lateral branches and tops, and packed in powdered charcoal, or perfectly dry earth in boxes, and placed out of the reach of frost in a cool place, they will retain their vitality until next April, when they may be cut into lengths of about a foot long, and planted with a dibble; insert them into the ground so as to leave about three inches of the cutting above the surface in any place where they are wanted to flower next summer. If kept tolerably moist they will be found to make good flowering plants with little trouble, and to any extent that may be required; the sorts that I have tried are Globosa, Globosa major, gracilis, virgata, and conica; they were packed in powdered charcoal on the 27th of October, and planted on the 6th of April. They flowered very well.—*A. C.*

The Mealy-Bug.—I wish you would call attention to Hereman's lotion for destroying the Mealy-bug, which is such a pest in our stoves. His printed paper does not do him justice, for it conveys an idea that the small-sized bottle will not be sufficient to effect near as much as it can really do. The only objection I had to make was the high price of the lotion, which would prevent its being used as freely as might be wished. He has since sent me a modified preparation, concerning which my gardener writes me word that he finds it equally effectual and less likely to injure the foliage; and that, I believe, Mr. Hereman will be able to sell at a lower price. I found the first lotion very effectual and harmless to the leaves in general; but in some instances hurting them very much, if not washed off presently; but it proved quite harmless if washed off soon after the application.—*W. Herbert, Manchester.* [We should like to hear the experience of our correspondents who have used this substance. This statement in its favour, by the Dean of Manchester, is very important; for certainly, if there is one thing more troublesome than another in glass-houses, it is this Mealy-bug. We must, however, beg those who may favour us with communications, to authenticate them by their signatures.]

Medlars.—As this is the proper time to gather the above, I would advise their being kept in the following manner, which will effectually prevent them from acquiring that dry rotten state, or tart disagreeable flavour to which they are so liable:—Select a dry day for the purpose, and see that none are bruised; have them placed singly on open shelves in a cool place, and look them over once a week, and the moment one is found decaying (not ripening), remove it, as one will taint the whole. They are much affected by a minute Fungus, which spreads in an incredibly short time, and destroys an immense number. By attending to these directions, this fruit will be eaten in perfection, which is seldom the case in this country.—*J. R.*

Brewing.—If the brewing of beer comes within your limits, I should be glad to be informed whether or not boiling the wort is necessary, either for making the liquor more palatable, more wholesome, or less liable to become stale or flat, or vapid in keeping. I am told that boiling is not necessary for any one of these, and that some persons make the very finest quality of ale without ever boiling it.—*Ignoramus.* [It is the general practice to boil the wort with the Hops, and opinion says that the more it is boiled the better the beer will keep. But some correspondents may, perhaps, be able to furnish a better answer to this inquiry. How is Preston Pans ale made?—the very best that can be bought.]

To preserve Tettenhall Pears.—Take half-a-peck of Pears, pare them, and, leaving the eyes and stalks on, put them into a pan with as much boiling water as will cover them; add a pint of Damson syrup; let them boil until they are tender, then put them into jars. Take the liquor in which they were boiled, and add to it one-third of sugar, and boil and pour it over them. Repeat this on the second day, and on the third do the same, putting in the other two-thirds of sugar. Let it boil until it is perfectly clear, and pour it hot upon the fruit; when cold, put brandied paper over them, and tie closely. Two pounds and a half of sugar is the quantity for half-a-peck of fruit. The above is a copy of a receipt I had given to me some years ago. I found the Pears liable to ferment in consequence of (as I supposed) the fruit not having been boiled in the syrup. I consequently stewed them in a third part of the sugar, reboiled the syrup, adding a little more sugar, and finished them as above directed on the third day. In this way they keep well. A little bruised ginger boiled or stewed with them is an improvement, and gives them the flavour of Indian preserves.—*A. W.*

Peas.—In consequence of an advertisement or recommendation in the *Chronicle*, I purchased a quart of Cormack's British Queen Peas. I imagined before that I had very good kinds, but find this very superior in every respect to any Pea I have yet grown. It is a great bearer, excellent in flavour, of a large size, and the straw is not of an inconvenient height. It is decidedly the best Pea I know, and I think that others who try it will agree with me.—*W. D. F.*

Bees.—The following is an account of a common straw-hive, taken by me on the 5th October, 1844. The weight of the hive with the comb, immediately after the bees were destroyed, was 88lbs. avoirdupois. I reckon the hive and combs to weigh 28 lbs., thus leaving the great weight of 60 lbs. for honey. This, I imagine, is an extraordinary quantity to be gathered by a swarm of the present year. It was swarmed in the latter end of June. —*A Subscriber, Devon.*

Morphology.—The numerous supporters of the somewhat astonishing doctrine of Morphology, which from time to time appear in the *Gardeners' Chronicle*, have caused the matter to be noticed by novices like myself; and whether the originators of this—to me—wild doctrine are correct or not, is of little consequence to persons of my humble pretensions. But if Morphology is to be received by your readers on the grounds set forth by T. Moore, at pages 685 and 686 of the *Chronicle*, I for one cannot subscribe to it. Our author says, "It may be remarked too, that several of the Achimenes, and A. pedunculata especially, should be regarded as plants of a very suspicious character by the opponents of this doctrine; for in several cases during the past season, it has been observed that this A. pedunculata has produced scarcely any flowers, but in their usual position abundance of little scaly bulbs have been protruded; here, what should have been flowers have been developed as bulbs." In a specimen of the old Cyrilla pulchella now before me, which is a near relative to Achimenes, there are whorls of flowers, and between the bases of the underside of the flower-stalk and the leaves, there are whorls of scaly bulbs, which is evidence sufficient that the said bulbs do not protrude themselves where the flowers should be situated, but the proper place for them is so near, that the flowers, scaly bulbs, and leaves, absolutely touch each other; therefore the supporters of the doctrine of Morphology should be careful not to do so by imperfect observation, as in this case; for in those very plants which our author states "should be regarded as plants of a suspicious character by the opponents of this doctrine," are seen distinct situations for both leaf, scaly bulb, and flower.—*A Gardeners' Wife.* [You are right. The scaly bulbs formed on the branches of inflorescence of the Achimenes are succulent buds, assuming the form of bulbs; and though it may be argued that since leaf-buds and flower-buds are formed on the same plan, therefore the scaly bodies of an Achimenes being altered leaf-buds, are equivalent to flowers, yet such a line of argument is not a good one for the purpose of convincing persons unable to comprehend the principles of Morphology; which principles are true and irrefragable.]

Dogs' Scent for Game.—There is a notion that dogs lose their scent, or smell for game birds, during the time of incubation; that, however, I consider to be wrong. I think it is more likely that the birds lose, or rather do not emit scent or smell during the time in question, and hence the notion. I mentioned this to a gentleman well acquainted with dogs and game, and he told me the following in favour of what I have advanced. He was once aware of a partridge's nest that was "hard set upon" near where a party of Gipsies had fixed their abode; although they had three dogs with them, yet the wary bird led off her brood three days afterwards. There must be some truth in what I have stated, otherwise the smell from the bird on the nest would have led the prowling dogs upon her. If my views on this subject are correct, it shows a wise provision of Nature to protect birds from harm during incubation; for, if it was not so, they must often fall a prey to canine enemies. It may be asked, How does it happen that birds do not emit smell while sitting on eggs? That may be owing to the habits or condition of birds being changed; for during the time of incubation they lose in a great measure all thought of self-preservation.—*J. Wighton.*

Vines on Open Walls.—After reading Mr. Hoare's book upon the Cultivation of Vines on Open Walls, I adopted the plan which he recommends, and I have now a considerable quantity of Grapes which are as large and as well flavoured as if grown under glass, to the surprise of every one who sees them or tastes them. I am living in latitude 52° 54′. The wall is a little east of south; it faces the sun at 11½ A.M. The Grapes have been quite ripe about a fortnight: some of the bunches sooner.—*C. A. A. Lloyd.*

Small Birds.—Being an imitator and admirer of Mr. Waterton, my garden has for the last six years been a rendezvous for all the birds in my neighbourhood; and although often remonstrated with by my gardener, I stood firm for some time. I was first shaken by seeing four bulfinches strip, in early spring, nearly every bud from a Greengage tree: I could not be mistaken. I tried to persuade myself that they were only hunting for eggs of insects, aphis, &c.; but the stripped trees and the strewn buds would, I think, have satisfied Mr. Waterton himself. My soil being cold, my Apples and Pears have remained on (the late soils) till now; having many small trees of new sorts with three or four fruits on, I was sorry to find that nearly every one of them had been attacked by birds. I believe the blackbirds have some of the blame to bear; but the principal performer is the little blue tomtit, already outlawed by reason of his attacks on the Peas. I did not find Mr. Knight's traps very successful. Can any one advise me as to the most successful mode of extirpating this garden enemy?—*Dodman.*

The Kingfisher's Nest.—Of the various materials and modes adopted by birds in the construction of their nests, those of the kingfisher are perhaps the least understood. The bird is found everywhere throughout Europe, and its brilliant plumage strongly contrasts with the little show made by most of the feathered tribe in this country. What early writers tell us of the kingfisher is so mixed up with the fabulous and ridiculous, that little reliance can be placed upon their accounts. Pliny says—"Their nests are wonderful—it is not discovered of what they are formed; some think of prickly back-bones, since they live upon fish." Bewick mentions that he had a kingfisher's nest with six eggs, "which resembled that of a chaffinch; it was made entirely of fish-bones, cemented together with a brown glutinous substance." He also relates Dr. Heysham's account of a boy finding a kingfisher's eggs in a hole "half a yard in length; at the end of it the eggs, which were six in number, were placed upon the bare mould, there being not the slightest appearance of a nest." My own knowledge of the kingfisher's nest is somewhat different from the above. I have found them in holes; but the eggs were not on the bare earth, but placed on a bed of very fine particles of fish-bones, not cemented together, but loose, and just hollowed out a little in order to receive the eggs. Part of one of those nests is now before me, which is very friable. It contained six eggs—the usual number of this interesting bird. The eggs are of a very delicate white, and are much like polished marble. It may be interesting to know how the bird procures these small fragments of fish-bones, to form its nest. They are evidently the pellets which these birds disgorge after eating fish, in the same way that owls and other birds bring up the fur and feathers of their prey in small balls; those of the Kingfisher have often been found in places which they frequent, of an oval shape about the size of a small Acorn. It is probable, however, that the small fragments are only those disgorged during the time of incubation. This corresponds with the boy's story already noticed, as well as with the statement of a writer in the "Museum of Animated Nature," who observes that the "kingfisher recasts the indigestible parts of its food, a circle of these *rejectaria* surrounds the eggs, and after the young are hatched is greatly increased; and hence has arisen the supposition that of pellets of fish-bones the nest is composed. This might induce the idea that after all that had been said of the kingfisher's 'wonderful nest,' it consisted merely of a few ejected pellets surrounding the eggs, which were placed on the bare ground. This, however, as already mentioned, is not the case; for the cavity or nest is as nicely lined with fine particles of bones, as the nests of other birds are with softer materials. The ordure of the brood may cause the bony fragments to adhere together; and so may have given rise to the old notion that the nest of the kingfisher was composed of bones cemented together. Although this bird prefers for its nest some place seldom disturbed, except by the patient angler, I have found the kingfisher in a sand-bank a quarter of a mile from a brook, in the act of digging or boring a hole for its nest, which is usually about an arm's length. Bewick seems to credit the idea that frequently the hole which leads to the nest is under water; but those who are acquainted with the habits of the kingfisher know, that though it darts into the water after its prey, it never enters the water like other water-birds. Perhaps the best way to ascertain if it lines its nest with bones before incubation, is to examine a nest when the bird begins to lay.—*J. Wighton.*

Moving Peach-trees.—Mr. Van Houtte, of Ghent, in his Catalogue, just published, observes that as regards Peaches, it is particularly to be recommended that they should not be moved till after the sap is completely out of the leaves and at rest; otherwise, much injury may arise. This does not appear to be consistent with the directions given in this country to plant wall-fruit as soon in the autumn as the leaves begin to turn yellow. He also, like others, recommends the gathering Pears as soon as the stalk easily separates from the branch; and adds, that if the fruit is left on till the leaves change colour, the quality of the fruit is much impaired. What is the experience of your correspondents as to this?—*Dodman.*

Beurré Diel Pear.—In "Notices to Correspondents," p. 704, it is stated that a specimen of Beurré Diel Pear measured 14½ inches in girth, and weighed 18½ ounces. I beg to say that I have gathered eight Pears of the same variety, each measuring 13 inches in circumference, and weighing 16 ounces; they were from a young tree 6 feet in height, and which measured, at the height of 1 foot from the ground, 4½ inches in girth.—*D. Murray, gr. to W. M. Reeves, Esq., Cork Vosterberg.*

Pear-trees Improved by being Dressed with Sand.—I find sand from the north coast of Cornwall to be the best dressing for Quince Stocks, on which I graft all the best kinds of Pears; the sand is composed of from 90 to 95 per cent. of lime, from the shells of fish. I have 150 sorts of Pears grafted on Quinces—most of them are twice grafted, in order to insure their growing strong—they are in full bearing. Some years ago I accidentally got a cargo of Dutch sand, which was disposed of in the Pear garden, and from that I found sand to improve the trees much. I followed up the idea, and got a cargo from Hugh, in Cornwall, which is nearly all shell, and from that time my Pears are very fine, and more juicy than formerly.—*Alex. Pontey.*

Strawberries.—I should object to "M. A. S.'s" tiles, (see p. 701) as well as the Editor's plan of paving, as they obstruct the escape of effluvia from the ground, which I consider necessary for the growth of the plant and perfection of the fruit. Detached pieces of stone, tile, or slate, placed under the fruit, are not subject to this objection. If "M. A. S." chooses to tile so compactly, let him spread over the tiles some guano, which will not only feed the leaves of the plants, but give a peculiar perfume, if not flavour, to the fruit.—*J. M. Goodiffe.*

Bokhara Clover.—"B. D. Greys" (see p. 702) seems disappointed in this only partially blossoming: it is a biennial, and of course does not flower until the second year; it grows 3 or 4 feet high during the first year, and considerably higher the second. In favourable situations it is said to attain the height of 11 or 12 feet; it should be cut for fodder when about 1½ feet in height; it is of very rapid growth, and may the second year be cut monthly; it is very branchy. I sowed some in July, and it grew the same year by Michaelmas, nearly to 2 feet in height. I then left the neighbourhood; but have heard that it grew up like trees in the next year. I should sow it in drills.—*J. M. Goodiffe, Granard.*

Bee-flowers.—If "B. D. Greys" wishes to provide for his bees, I would recommend French (Buck or Brank) Wheat; they are so very fond of the blossom that he will not only feed his own bees, but those of his neighbours for miles round. I had 2 acres of it once (not sown till the first week of July, to ascertain how late it might be sown with a chance of a crop), and every blossom was scarcely ever without its attendant bee, though I had none of my own. Successions of it might be sown for the bees from April till the end of July; mine blossomed within a month after it was sown; but it cannot stand frost; it is its only enemy, but an invincible one. For a seed-crop it should not therefore be ventured on later than the end of June. Some crops I hazarded later were destroyed by night frosts.—*J. M. Goodiffe.* [It is not fond of clay land.]

The Pensile Grossbeak.—The description of this bird's nest, p. 670, is very entertaining, as accounts from Natural History must ever be to those who are not eye-witnesses of the facts stated. I have before me as I write two wasps' nests, one of the size of a hen's egg, built on a comb in a hive which the bees deserted; the other is a pensile nest, as large nearly as a human head, being 18 inches in circumference either way. It was built at the extremity of a branch of a Larch, the builders ingeniously taking into the work the smaller twigs, as a support to the structure. Both nests are formed of numerous laminæ of the same material—a very thin papyrus, as it may be most justly called, of a grayish colour, and rather striped. The cells in the combs of both are open at top, others are carefully capped. In the former are seen young wasps perfectly formed, but motionless. Should these not resuscitate in spring, and fly out upon us from the chimney-piece of our sitting-room, where their habitations are now a handsome ornament as well as a great curiosity, all will be well.—*J. B.*

Flower-beds.—I have a geometric garden, which I purpose to fill next year with beds of half-hardy plants; but I am anxious to have it gay before such plants can bloom in the open air, and shall be much obliged to any of your correspondents who will give me hints on the subject. I am provided with Anemones, Crocuses, &c., to remove when the beds are prepared for Pelargoniums, &c.—*K. W. W., Chertsey.*

Weather in the North.—It is a singular circumstance, that whilst we have been hearing of heavy falls of rain in the southern and midland counties of England, no rain at all has fallen here since the commencement of this month; dry easterly winds, resembling the weather of March, have prevailed, with a temperature ranging from 38° the minimum generally 40° Fahrenheit, by night, to 48°, the maximum by day. The Dahlias continue still

in flower in the gardens, and other half-hardy plants remain blooming in the open ground.—*Cartmel, near Lancaster.*

The Grey Wagtail.—This bird has found its way here again this autumn. I saw the species in the village as early as Sept. 11; but we had not the favour of a visit until the 9th of this month, on the morning of which day I heard the well-remembered tapping at the window so much frequented last year. If this bird be our old acquaintance (as I am inclined to believe) he has certainly come in much better condition than when he arrived last autumn. I now see him in company with another of his kind; but only one appears at the window, and that much seldomer than before.—*S. Warnford.*

Recipe for drying Pears for Dessert.—Pare the Pears and leave the stalks on; cover them with water; and either boil in a brass kettle, or stew in earthenware, until they are tender; then lay them upon old dishes, and put them in a slow oven to dry; turn them frequently, that all parts may dry equally; when done put them in paper bags, and hang them in a dry place, or keep them in tin canisters or boxes. Reserve the water in which the fruit is boiled, and by constantly using this for the succeeding operation, a syrup is obtained, which gives a gloss to the fruit, as if sugar was used. I never use sugar for them. —*A. W.*

White Beet.—Is the White Beet, or the Chard, the true Mangel Kohl of Switzerland and Germany, the leaves of which are so much used in the place of Spinach? What was distributed as White Beet by the Horticultural Society, did not, I conceive, produce leaves so fine as that which is grown in Switzerland. This may possibly be owing to the leaves not growing so luxuriantly as that cultivated abroad. I observed some of these from 3 to 4 feet in length — liquid manure being very plentifully applied.—*Dodman.*

Lettuce-leaved Spinach. — I may observe, that the Spinach, the seed of which was distributed by the Horticultural Society, under the name of Lettuce-leaved, proved excellent, tender, and high flavoured, and stood last winter well, though the leaves appeared far more tender and succulent than the common winter sort. I found transplanting a portion of the plants, when too thick or too forward, a good plan, and produced a good late crop for the spring, just before the first spring crop came into use.—*Dodman.*

Whitney's Composition.—I have had several boxes made in the shape of a small garden-light box, some 3 feet, and some 2 feet 6 inches square, about 6 or 8 inches at the back, and 4 inches in the front; these I covered with thin calico, and varnished it over with Whitney's preparation. They have answered admirably for cuttings, and my gardener finds them an admirable and economical substitute for hand-glasses; any old packing-case, cut into two diagonals, makes a pair of useful frames. The muslin I found too thin, as I could not apply sufficient of the mixture to exclude the rain.—*Dodman.*

Societies.

MICROSCOPICAL SOCIETY.

Nov. 13.—T. Bell, Esq., in the chair. A Paper was read by Mr. Busk, on the Echinococcus, a form of Cystic Entozoa. After giving a slight sketch of the history of researches on the Entozoa, the author proceeded to describe the Echinococcus. This Entozoon is developed in a fibrinous cyst, which is found in the liver, lungs, and other viscera of human beings, and other classes of the Mammalia. The cyst in which the Echinococcus is contained has its internal parietes covered with rounded granular masses. On examining these masses, they are found to consist of a number of globular bodies, seated on a common receptacle, of a branched form, and covered with a delicate membrane. The globular bodies are the Echinococci. Each is attached to a pedicel, and the whole are united to a common trunk. When separated from the trunk, they appear like polygastric animalcules. Each globular body contains several transparent cells, like the stomachs of Polygastria. The head, or jaws, consisting of a row of hooked tentacles, is retracted within the cavity of the body; but during decomposition, this apparatus becomes exserted, thus having led to the different characters given to this animal. The Paper was illustrated by drawings and diagrams.—The President announced that arrangements had been made for facilitating the use, by the Members, of the splendid microscopes of the Society. The rooms were open every Wednesday from 10 to 4, and members would be allowed the use of the microscopes under the superintendence of Mr. Lennard. It was also announced that the second Part of the first Volume of the Transactions of the Society was ready for distribution gratis, among the members who were not in arrear with their subscriptions.

SOCIETY OF ARTS.

Nov. 6th.—T. Hoblyn, Esq., V.P., in the Chair. Sir. J. L. Goldsmid, Bart., Dr. Major, G. Buck, and K. Hunt, Esqrs., and Dr. Cronin, were elected members.

Nov. 13th.—R. Twining, Esq., V.P., in the Chair. A Paper on British and Foreign Honey, by Mr. Milton,* was read by the Secretary. Various specimens of honey from Athens, Minorca, Portugal, Narbonne, and different parts of England and Scotland, were placed on the table; also the produce of bees kept in glass hives by gentlemen in the Temple and the Regent's Park; a single comb in particular is worthy of notice, as having been taken from a newly-invented hive so constructed as to direct bees in the disposition of their work, which, however, in the present instance, is not perfect, for some of the cells instead of being regular are irregular hexagons; the author of the Paper, however, has no doubt of ultimate success. A detailed account is given of the structure of the honey-bee, of the mechanical construction of the comb, of the flowers best suited to produce honey of the finest flavour, of the best seasons of the year for taking the honey, of its medicinal qualities for various diseases, of the quality of honey produced in different parts of England under different systems of management. of the encouragement given to cottagers to keep bees by a gentleman in the vicinity of the Westmoreland lakes, and, lastly, of the great profit to be derived from bee-keeping.

* Mr. Milton is an extensive dealer in bees, also bee-hives and honey, as well as the Author of "The Practical Bee-Keeper."

The following is a List of the Samples of Honey exhibited on this occasion:—

English Honey.—1. Oxfordshire Honey, weight 27 lbs.; 2. Regent's-park Honey, weight 16 lbs., collected by the bees of S. Hodgson, Esq. (the glass was put on the 27th May, 1844, and taken off filled July 31st); 3. Regent's-park Honey, weight 14 lbs., was filled by a swarm from the above, No. 2; 4. Honey, Maida-hill, weight 20 lbs., was collected by the bees of C. J. Monkhouse, Esq. (glass put on the 2d of June, 1844, taken off July 20th); 5. Honey from Hackney, bees belonging to A. Smart, Esq., weight 14 lbs., June and July, filled by the bees in 35 days; 6. Honey from Mill-hill, Hendon, bees belonging to the Rev. B. Nicols, weight 21 lbs. (the straw hive from which this cap was taken now weighs 40 lbs; 7. Honey from Fulham, worked by the bees in a flower-pot; 8. Honey from a Baxter hive, worked by bees at Chertsey; a comb of Honey, worked in a frame by bees belonging to the Rev. J. E. Gray, of Wembly-park, near Harrow; the bar-and-frame hive was invented by W. A. Munn, Esq., and constructed to direct the bees in their building of comb, and do without a guide-comb; Honey from Northumberland is slightly flavoured with Heath; Honey from Saffron Walden, Essex, equal to any; English Heath Honey, from East Hampstead, near Bagshot; Comb Honey in the plate, from Scotland; Comb Honey in the plate, from Fulham.

Foreign Honey.—1. Minorca Honey, small jar, just as imported; 2. Minorca, opened for the purpose of tasting; 3. Narbonne Honey; 3*. Normandy Honey; 4. Italian Honey; 5. Portugal Honey, imported in jars, very similar to those from Athens; 6, Honey from Hymettus, in antique jars, one specimen; Cuba Honey is imported in large quantities, sells at a very low price, and serves to keep all the inferior qualities of Honey at a low remunerating price; Jamaica Honey set firm—Jamaica Honey not set, has been imported to England 10 months; Seville Honey, rather of the Jessamine flavour; Portugal Honey, flavour of the Wild Raspberry; Honey from Devonshire—it partakes of the flavour of the Portugal Laurel, which is much cultivated in that part where the Honey came from; in all there were 26 various specimens.

The Second Paper was on the Grenier Mobile, or revolving granary, the invention of M. Vallery, a French Engineer, by Thos. Birmingham. The object of this machine, a model of which was placed before the meeting, is to prevent fermentation and decomposition, which so frequently take place in Corn stored in the ordinary granary, as also to get rid of those troublesome and destructive insects, the weevil, mite, curculis, and moth. The revolving granary consists of a large wooden cylinder, the size of which is regulated by the quantity of Corn to be stored; the interior is lined with wire gauze for the admission of air, and has eight radial compartments for storing the Corn; the axis on which the granary revolves is hollow, and acts as a ventilating tube by means of a fan working at one end; one end of the cylinder is furnished with a circular rack, into which works a pinion attached to a handle, by which motion is given to the machine. Neither mildew nor rust can be formed; the weevils and other insects are destroyed, the Corn is sifted and kept free from dust and dirt, all damage from rats and other vermin is prevented. It undergoes no injury, as in being turned over by the shovel the quality of the grain is found to be materially improved, even if gathered under unfavourable circumstances of the weather. It has been successfully introduced into different parts of France.

Reviews.

Agricultural Chemistry. By G. Cox. London, 1844. 12mo.

The object of this little book is to enable practical men to establish or refute the opinions of others; or, in other words, to make chemists of farmers, and teach them how to analyse soils and plants. Farmers have no time to perform chemical analyses, and even if they had, their analyses would be of very little use to them; for without much practice it is impossible to perform minute chemical inquiries, so as to obtain trustworthy results. The book is rather carelessly written, containing a number of strange statements and questionable facts, which we fear are more likely to mislead than to instruct. It is published as a companion to a portable laboratory, or test-chest, sold by the author.

Miscellaneous.

Dignity of Labour.—I have faith in labour, and I see the goodness of God in placing us in a world where labour alone can keep us alive. I would not change, if I could, our subjection to physical laws, our exposure to hunger and cold, and the necessity of constant conflicts with the material world. I would not, if I could, so temper the elements that they should infuse into us only grateful sensations, that they should make vegetation so exuberant as to anticipate every want, and the minerals so ductile as to offer no resistance to our strength or skill. Such a world would make a contemptible race. Man owes his growth, his energy, chiefly to that striving of the will, that conflict with difficulty, which we call effort. Easy, pleasant work does not make robust minds, does not give men such a consciousness of their powers, does not train to endurance, to perseverance, to steady force of will—that force without which all other acquisitions avail nothing.—*Channing.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Amateurs who manage their own plants, are often at a loss to know how dry or how moist a house should be when either state is recommended by gardeners or in Calendars, and the thing can hardly be explained without the use of a hygrometer. In a general way we say, keep all plant-houses dry in winter: but this only means the opposite of our summer treatment, and not real dryness, for no plant-house, except, perhaps, for succulents, could be quite dry for any length of time without injuring some plants. In clear frosty weather, when strong fires are necessary, the plants in this house will be much benefited by a slight syringing early in the day; but during this month this is seldom done, and for the next six weeks stove-plants need less water at the roots than at any other season. Those who grow Clerodendrons, Justicias, Vineas, and other soft-wooded stove-plants for the purpose of decorating rooms and conservatories, will find Cuphea Melvilla a good addition to them; like some Pelargoniums it flowers at any time between May and Christmas, according to the time at which it is pruned; it soon makes a large specimen; prune it closely and treat it like Eranthemum pulchellum.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

The subject of the winter decoration of the Flower-garden was so fully discussed in this Paper at page 707, 1843, that it is not necessary for me to do more at this time than refer the reader to it, where he will find lists of plants, and every necessary information. An arrangement of this kind gives a garden a highly interesting appearance through the dull months of winter, and the only objection that can be urged against it is, that, where bulbs are cultivated, they cannot be managed so conveniently as if the beds were unoccupied. This, however, might be obviated by growing both the shrubs and bulbs in pots; but it is very questionable whether the latter could be so well grown as if planted in the open soil. Keep the ground as neat and clean as possible; and roll the walks and Grass as frequently as the weather will admit of your doing so.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas will still require well looking after; all dead or yellow leaves must be gently stripped off, taking care not to wound the stem: the top soil must be frequently moved, and if there should be any appearance of bad drainage, the soil must be carefully turned out, keeping the ball entire, and more broken pot added. During rainy weather the lights of the frames must be kept on, but tilted behind, and a free circulation of air amongst the pots must be insured by raising the frame a few inches from the ground. Should autumnal blooms be thrown up, pull off the pips as soon as formed, when they appear to be heart flowers, it is better to let the stems remain. *Tulips.*—This is certainly rather an awkward time for bulbs, and especially those which were at all diseased when planted. Beds ought to be well trenched in the middle, to allow the free escape of all superfluous moisture and the drenching rains, which we have lately had so much of. *Carnations.*—We know of a few extra fine seedlings, which will, we do not not, prove "gems of the first water." Several have been exhibited; and in class-showing (which we hold to be the most legitimate way of proving the merits of a seedling flower), they have beaten such varieties as Ely's Jolly Dragoon, Hufton's Patriarch, Ely's Lady Ely, &c., and that too when the last named flowers were in a fine state. We certainly shall not be surprised at many of our favourites being completely eclipsed next season, for however cautious we ought to be in giving an opinion on flowers only once seen, still, from the splendid blooms which have come under our notice, we are led to judge most favourably of them. Carnations in frames will require all the air and exposure possible this damp weather, avoiding continuous wet; should any plants appear mildewed, or the leaves become spotted, the diseased parts should be immediately removed, and the plants be placed away from the general stock, in a frame to themselves. *Pansies* that have made long and straggling shoots, may now be cut closely, leaving a joint above the ground, and hoops should be placed over the choicest beds, that protection may be given in the event of sudden frost, which, at this season, is apt to occur after excessive rain.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Tank-heating has made the winter management of Pines so simple and free from risk, that till I recollect that many still grow their Pines with the heat produced by fermenting materials alone, I fancy that all that is necessary to be said about Pines for the next two months might be put into a very few lines, and thus the almost unavoidable repetition that has to be made in this part of the Calendar is prevented. The Pines in houses heated by pipes or flues can easily be kept in that state of moderate growth which is found to be most suitable for them during winter, without their suffering from the effects of the present damp and cloudy weather; as during the day a slight addition to the heat can be made, so as to allow air to be given for a short time about mid-day; but in pits, without other means of heating than dung and leaves, it will be necessary to keep the heat up a little higher in mild weather, in order to be prepared for any sudden depression of the external temperature, and to be enabled to give air daily for a short time at the top lights. This will prevent the plants from drawing, and keep the atmosphere sweet. Be careful not to give much water, which is injurious to the roots at this season.

Vineries.—Vines in pots or boxes started in the beginning of October should now be showing. Let the temperature be 57° or 60° by night, and 75° by day, with fire-heat, and from 80° to 85° with sun-heat. Syringe twice a day. Vineries which are expected to produce ripe fruit by the end of April, should be closed now; and if it is convenient to have a ridge of half leaves and half stable litter along the middle of the house, it will be the most genial means of exciting the buds. Keep a temperature of from 50° to 55° when the weather is mild, and some degrees lower when the weather is cold.

Peach-Houses.—Get the late-house put into the same state of repair and order as the others. Where it happens that fresh trees have been planted in the house that was forced first last season, and the trees in the second house are in good condition, it will be well to change the order of succession, so as to give the newly-planted trees as much time to make roots as possible. To have Peaches in April, start those in pots and boxes now, and if they can have a slight bottom-heat the buds will swell more freely and uniformly. Let the temperature at night be about 50° in mild weather; when fire is necessary, 45° will be sufficient. Syringe often, to soften the scales of the buds.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Canker.—Few things are more annoying than this visitation, to those who delight to see their trees healthy, and producing good-flavoured fruit. As this is the season for planting, or preparing for it, considerable attention should be given to the procuring of hardy as well as good sorts in all cases where the situation is not the most favourable. In addition to examining the lists of kinds suited to different localities, so often given in answer to correspondents, the planter should take the trouble of ascertaining what sorts thrive best in circumstances similar to his own. Canker owes its origin chiefly to these sources:—Planting too deep—the result of which is, that the roots are supplied with more nourishment, such as it is, than the heat and sunlight of the place can duly elaborate, so as to give ripeness and firmness of texture to the young wood; or from the roots getting into an unfavourable soil—that furnishes the trees with vitiated juices; or from the climate of the situation being too cold, or the season too damp and sunless to permit the healthy action of the plant. Some young trees that I planted very carefully on hillocks suffered considerably last season,

after being exposed to the sudden and severe frosts of the spring of 1843, coming, as it did, after a comparatively mild winter. This season has been so good for ripening the wood, that I think they will now get over the misfortune. Where canker exists, the diseased parts should be cut out in spring or summer, and the wound covered over with clay and cow-dung; but all applications of this nature will be of very temporary influence, unless attention is paid to the following things:—Plant sorts, the wood of which may be expected to ripen in the situation; improve the climate by thorough draining of the soil; raise the trees on hillocks above the surrounding surface, after having a substratum of concrete, tiles, slates, &c. at the requisite depth, to prevent the downward progress of the roots; never bury the collar of the tree; expose and aerate the soil before planting, and use no manure but as mulching, and you will generally be rewarded—not by astonishing quickness of growth, nor by your Apples and Pears towering their heads like forest-trees, but by seeing them produce healthy, though rather stunted wood, covered with fruitful buds; and if you imagine that you must wait a long time for the full occupancy of your ground, by such moderate growth, you may increase the number of trees.

Routine.—All labour in the kitchen-garden has been at a stand-still lately; the weather either being so drenching or the ground so wet, that little effective could be done. It always implies bad management to see garden-labourers out of doors in unfavourable weather. Take such opportunities for tying mats, making straw or reed covers, thatching hurdles, preparing wood for supporting frames to waterproofed cloth, painted canvas, asphalted felt, &c. Attend to Mushroom-beds in houses; examine all stoves, so that as soon as the weather clears up, your full effective force of labour may be directed to the performance of the necessary operations, and effecting needful changes and improvements.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Thin and fell deciduous trees, except such as are valuable for their bark. Fill up vacant spaces with young trees, or plants of the most profitable kinds. Repair fences, open water-courses, clean out drains and make new ones where they are wanted.

Coppice.—Continue to plant all vacant spaces with young plants of the most profitable kinds of trees. Clean out water-courses and drains, as directed above, and make new ones where they are wanted. Repair fences, and keep everything in good order.

Young Plantations.—Continue to plant in dry ground any new plantations; replace dead plants in former planted ones; but if the soil is stiff, cold, and wet, defer such work till spring. Thinning may be proceeded with in neglected plantations.

Hedge-rows.—The repairing of hedges, scouring of ditches, planting suitable plants, training maiden naturally raised trees of proper kinds, replacing dead or injured plants, and removing all valueless and injurious trees in hedge-rows, should be proceeded with at all convenient times.

Nursery Work.—Proceed with taking up plants, sorting them, and laying them in by the heels in well-pulverised soil, till wanted for planting again. Trench and dig ground for replanting cuttings and seedlings towards spring; this work might be forwarded in fine weather, in some dry soils and favourable situations, during the winter months.—*W. B.*

State of the Weather near London for the week ending Nov. 14, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 21st 1833—therm. 59°; and the lowest on the 23d, 1837—therm. 20°.

Notices to Correspondents.

Apples.—*A. W. G. B.*—You will find Dumelow's Seedling a well-flavoured sound keeping baking Apple.‡

Back Numbers of the Gardeners' Chronicle.—We are so often applied to for particular back Numbers to complete sets, and so many are now out of print, that we think it will save all parties trouble if we publish a list of those which may still be had. Any subscriber who will forward to our publisher Post-office stamps equivalent to as many Numbers as are required, should have them sent:—

1841:—1, 4, 6, 8, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 35, 36, 39, 47, 49, 51.

1842:—4, 6, 8, 11, 13, 18, 27, 33, 35, 42, 50, 51, 52, 53.

1843:—9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51.

Books.—*Waterford*—"Notions sur l'art de faire des boutures. Par Neumann." Inquire of any foreign bookseller.—*Querist.*—You must apply to the Secretary of the New Zealand Company, Broad-street, City. There you will get full information. Dieffenbach's book on New Zealand will probably answer your purpose.—*An Inquirer.*—Dix's "Practical Geometry" is cheap, and excellent for a beginner. We are not acquainted with the books you mention.‡

Fruit-trees.—*W. W.*—The following being such as are not generally liable to canker, may probably suit your soil:—Dessert Apples—Claygate Pearmain, Cockle Pippin, Court of Wick, Braddick's Nonpareil, Court pendu Plat, Pearson's Plate, Downton Nonpareil, Scarlet Nonpareil, Sturmer Pippin. Kitchen Apples—Dumelow's Seedling, Bedfordshire Foundling, Wormsley Pippin, Alfriston. Pears for Espaliers—Marie Louise, Beurré Diel, B. Bosc, B. Rance, Glout Morceau, Knight's Monarch, Belmont, Thompson's, Althorp Crassane.

Gladioli, &c.—*A. T., Old Kent-road.*—Plant your Gladioli, Irises, Tulips, Hyacinths, and Crocuses, about two inches below the surface of the ground. The cause of the Gladioli not flowering is either owing to the roots having been taken up in the previous season before they were matured, or owing to the plants having been in too dry a state last year, when they should have made their fresh bulbs, after flowering.

Grapes.—*Tyro.*—The Blanche (Vigne) is a very early white Grape, with somewhat oval berries. It fruited last season in the nursery of Messrs. Lee, at Hammersmith.—*G. B.*—If you refer to the third edition of the Horticultural Society's Catalogue of Fruits, instead of the second, you will feel satisfied that, according to it, your Grape is the Blue Frontignan. Its pedicels have a purplish tinge, and it possesses so little of the Frontignan flavour, that it ought to have been distinguished by a different name.—*Rutilus.*—The White Muscat of Alexandria is, by some, called the White Tokay. The Royal Muscadine may be properly added to your collection, in which the black Hamburgh are the strongest growers. If you can allow their roots 5 feet of border instead of 4, so much the better. This variety is best adapted for close spurring.‖

Greenhouses.—*y. a. b.*—A house 13 feet high in the back, and 15 feet in the clear, should be 6 feet high in front, allowing 3 feet for brickwork, and 3 feet for front lights. For glazing the house sheet-glass is best; although dearest at first, it is cheapest in the long-run. It is impossible to say what length of 4-inch pipe you would require, without knowing the length of the house. A flow and return on the front will probably be sufficient.§

Heating.—*Inquisitor.*—The attempt to employ earthen pipes as conduits of hot water failed in the garden of the Horticultural Society. It was found impracticable to prevent the joints breaking. We can find no cement that will stand.

Hothouses.—*An Admirer of Plants* has favoured us with a good plan of a span-roof house; but we see nothing so novel in the construction as to make it worth publication. All such houses are necessarily made upon such a plan.

Insects.—*Tonbridge Wells.*—I do not think the insects sent are the cause of the spot in Geranium-leaves; if they be, it is the Aphides which are the culprits; for the insects transmitted are nothing more than dead Plant-lice, which have been stung by a minute Ichneumon. *R.*—*B. B.*—Gardeners, like Entomologists, should place all infected or suspected specimens in quarantine, where they might be operated upon until a clean bill of health was obtained. We can give you no better advice regarding the Mealy-bug than you will find in last year's *Chronicle*, in some of the following pages: 443, 517, 588, 676, 745, 805, and p. 427 and 499 for this year. *R.* Try "Hereman's Dilution," advertised at page 663.—*C. M.*—The Wheat-weevils are the Calandra oryzæ. Pray rear them, and see if their economy be the same as that of C. granaria. *R.*—*D. Lindsey.*—As it would not be much trouble, I should be tempted to paint an infested tree thoroughly with a thick wash of lime and water, and see whether it had the desired effect. I shall be much obliged by your giving me the result of your experiments. *R.*—*Ullswater.*—Your statement surprises me. I could not imagine that the immersion of the larvæ of the Brachen-cloch in undiluted gas-water, lime-water, and strong brine, would not kill them. I have known many similar instances of pastures being as badly affected as yours, but the nuisance has always vanished in a year or two, when the beetles have hatched, and departed for a new locality. *R.*

Large Fruit.—*G. I.*—We must beg you to authenticate your statement by giving your name—confidentially if you please.

Lettuces.—*A Correspondent.*—In order to preserve your Bath Cos Lettuces, which are just beginning to cabbage, over winter, put a frame over them, and make a trench all round, with a gutter from it for the purpose of carrying away water. Keep the lights as much closed as you can.‡

Morphology.—*A. M.*—You cannot have misunderstood us more than by supposing that this subject is not open to controversy. On the contrary, it is one peculiarly suited to discussion. It is, however, requisite that those who make speeches, or write letters about it, should know of what they talk. If a man who is so ignorant as to suppose that the sun moves round the earth were to engage in a controversy upon an astronomical question, he would be set down by all men of common sense as a presumptuous blockhead. Some of the people who have ventured to talk about Morphology are in an exactly similar position, and their proceedings have been contemptible. You may think this a strong expression, but we can find no term at hand more applicable to their doings. There is nothing which lessens young men in the eyes of their employers more than conceit; and of this bad quality some of the late proceedings relative to the present question have produced an amazing crop. It is not a man's fault that he is ignorant; nor is it to be imputed as blame to him that he is dull-witted; but he is justly liable to censure when, being both ignorant and dull-witted, he nevertheless ventures to intrude his shallow opinions upon the public. What do you say to a person who pretends to argue upon such abstruse points of vegetable organisation as are involved in the science of Morphology, not even knowing that a Dahlia is not a flower? *Proh! pudor.*

Moss.—*A Subscriber.*—Instead of nitrate of soda use gas-water to destroy the Moss on your lawn. As that fluid varies greatly in strength, we cannot say how much water should be added to it. If very strong, it may have four parts of water. Try it in a small quantity at first. It must be strong enough to turn the Grass quite brown.

Names of Fruits.—*J. B. B.*—1, Alfriston; 2, 5, Brown Beurré; 3, probably Black Worcester; 4, Napoleon.‖—*Tolla.*—If you can send a fruit that has a slight shade of pink, from your supposed Golden Pippin tree, it will be attended to. The true old Golden Pippin can be purchased occasionally in London.‖—*J. M. T.*—1, Beurré Diel; 2, Glout Morceau; 3, Beurré Rance; 4, Bezi de la Motte; 5, Brown Beurré; 6, Seckel. Apples: 7, Flower of Kent; 9, King of the Pippins; 11, Easter Pippin, or French Crab.‖—*W. B. U.*—2, Buchanan's Spring Beurré; 3, Spanish Bon Chrétien; 4, Glout Morceau; 5, appears to be Margil.‖—*C. C.*—The tickets were found detached. The Seckel was not among the Pears. There were two Passe Colmars, and four Glout Morceaux; Beurré Diel, Flemish Beauty, Old Colmar, Marie Louise, St. Germain. The small Apple is the Downton; the other Dutch Mignonne.‖—*Original Subscriber.*—1, Catillac; 2, Beurré d'Aremberg; 3, Napoleon; 4, Glout Morceau.‖—*Sydenham.*—Your Pear is the Seckel.—*S. E. X.*—2, Beurré d'Aelle; 3, Gansel's Bergamot; 4, Yellow Ingestrie; 5, Fearn's Pippin; 6, Dumelow's Seedling; 7, Blenheim Pippin; 8, Winter Queening: 12, Winter Nelis.—*M. M.*—2, Chaumontel; 3, Easter Beurré; 4, Chaptal; 5, Marie Louise; 6, Glout Morceau.‖—*R. Cooper.*—1, White Doyenné; 2, Napoleon; 3, Winter Nelis.‖

Names of Plants.—*A Lady.*—1, Asplenium adiantum nigrum 2, Polypodium vulgare; 3, Asplenium trichomanes; 4, Adiantum capillus veneris.§—*G. W., Newcastle.*—A new Leochilus.

Peaches.—*G. M.*—In addition to the Noblesse and Royal George Peaches, for forcing in pots, the Grosse Mignonne is recommended for its earliness; and the Bellegarde, being later than those above-mentioned, will afford a succession, and it bears forcing well.‖

Pelargoniums.—*Clericus.*—Shift those plants immediately that are to be placed in the forcing-house, and leave the others till the middle of January. The difference in the time of the cuttings rooting arises probably from the constitution of the plants, some sorts striking more rapidly than others. Discard from your collection Nos. 4, 9, 12, 25, 28, 35, 44, 46, 49, and supply their places by Sultana, Oberon, Pulchellum, Lucia, Cleopatra, Symmetry, Hodge's Commodore, Lyne's Duke of Cornwall, and Cyrus Superb.*

Protection.—*J. L.*—As we cannot tell what sort of winter is coming, it is impossible to say how much protection your pit will require. We should, however, run the risk of covering the lights with thatched frames or hurdles, which, in all probability, will be quite sufficient, and much cheaper than the other contrivances you name.

Roses.—*A. x.*—The following selection of hardy Perpetual Roses may be procured for about 1s. 6d. each, viz., Antinous, dark crimson; Bernard, pink, very fragrant; Comte de Paris, light crimson, with a lilac tinge; Fulgorie, bright rose; Lady Fordwick, deep rose blooms in clusters; Princesse Hélène, rose with a purple tinge; Marshal Soult, light crimson; Crimson Perpetual, brilliant crimson; Edward Jesse, lilac rose; Bouquet de flore, rosy carmine; Aubernon, crimson; and Aricie, rosy lilac.‡—*Pobor.*—Cut the branches off your Rose stocks now, to within about 1 foot of the stem. In spring, when the buds are starting, let the branches be cut off as closely as possible.‡

Tomato-sauce.—*J. R.*—To make this, when the Tomatoes are quite ripe cut them in two, press out the pulp, and separate the seeds; then put them into a skillet, with some savoury sauce, and a little salt. When of the thickness of Pea-soup rub it through a coarse cloth, boil it to the consistence of marmalade, put it into jars, and in a day or two after pour over it lard or butter, and tie down with oiled paper.

Train Oil.—*R.* inquires whether train-oil is injurious to the growth of young forest-trees, if applied sparingly, for the purpose of protecting them from the injury so generally caused by rabbits and hares? Also, whether any vegetable oils may be more or less advantageously employed than train-oil for the destruction of the muscle-scale on Apple and Pear-trees? *R.*

Yews.—*J. W. Y.*—It will be impossible to render your Yew-hedge thick at the bottom without cutting it back somewhat; an operation best performed in the months of March or August. We should not, however, cut it down; severe cutting back and thinning will probably answer every purpose. The point is to induce the old wood to form buds; and this can only be effected by letting light into the branches freely, and stopping the flow of sap when it is strongest.

Miscellaneous.—*M. M.*—The curious scaly bodies from your Achimenes are buds, or rather bulbs; for a bulb is only a deciduous bud. They appear in great abundance when anything occurs to hinder the formation of flowers. Each will make a new plant.—*Anne.*—We do not know what Rhodalia is, and therefore we cannot advise you as to the cultivation of it. We should doubt the exactness of the information furnished you by your Cader Idris guide.—*M. A. B.*—If you mean by A. longiflora, Amaryllis longifolia, the best way to treat it is to keep it in a large pot in a greenhouse during winter, and to plunge it in the summer in a pond of water.—*A Florist.*—There is no such plant as Azalea japonica.—*Sylvanus.*—Never cut down Oak, Ash, or Chesnut, when first planted out; nor afterwards, if they grow well, until they become very strong; then they may be cut back for coppice-wood with most advantage.—*W. F. C.*—An Evergreen Oak hedge is nothing like as strong and effective a fence as a Thorn one. Bignonia jasminoides is a tender plant.—*Δεινων.*—Your list of Roses contains a very good selection of hardy kinds.‡—*Z. Y. X.*—It is only necessary to protect the heads of your tender Roses budded on the wild Rose stock. Now is a very good time to plant Quince cuttings.¶—*A. W. G. B.*—Take up your Moutan Pæony on the first dry day, and remove all the old soil from its roots; then plant it in a compost consisting of fresh loam, sandy peat, and well-decayed cow-dung, in nearly equal parts. If a little superphosphate of lime is mixed in the soil it will be of great benefit. Roses require a rich soil, and should therefore be frequently manured, particularly if they are in a dry situation.¶—*Neverfailing.*—Crocuses, Snowdrops, Hyacinths, Violets, common double Daisies, and such things, will enliven your Ward's Case during winter, if you keep it in a room with a fire.—*J. W.*—Strike the Almond stones on the edge with a hammer.—*E. H.*—Gesnera macrorhiza, *Dumortier*; Cuphea strigillosa, *Humboldt and Kunth*; Clitoria fulgens (no such plant); Franciscea Pohliana, *Hooker*; Franciscea hydrangeiformis, *Pohl*; Nemophila discoidalis, *Fischer* (?); Epacris miniata, *Lindl.*; Aerides maculosum, *Lindl.*; Achimenes picta, *Bentham*; Comparettia falcata, *Poppig*; Gloxinia discolor (no such plant); Anemone Govaniana, *Wallich*. All the other names are Dr. Lindley's. We must now beg for a truce to this sort of questioning.—*E. A. Nicholson.*—To preserve your Peas from birds, stretch twine round and over the plantation, at convenient distances, about 2 feet from the ground, attaching to it here and there pieces of red-coloured cloth. A Potato stuck full of feathers, and attached to a stake by a piece of twine, so as to be easily moved by the winds, has also the effect of frightening birds.‡—*F. L.*—In pruning your Vines, which are trained up the rafters of a greenhouse, cut the young wood back, quite close to the main stem, every season.‡—*T. Littlewood.*—You may enlarge your Rhubarb beds by dividing and planting the roots in February.‡—*A Friend.*—Next week.‡—*A. B.*—A solution of corrosive sublimate, in either water or spirit, will certainly prevent your Japan cabinet from being destroyed by worms, if you can apply it; if not, it is possible that trimmings of Russia leather may drive off the enemy; failing this, we should fill it with bruised Laurel leaves, and place it in a temperature of 100° for a couple of hours.—*T. G. H.*—Gymnium is not mentioned in the "Penny Cyclopædia." Rhizomorpha perfects its growth in subterranean places. You will some day hear all about it from Mr. Berkeley.—*Δελτα.*—Florists' flowers are the flowers selected by florists for cultivation, which produce varieties from seed, and which varieties are susceptible of being continued by propagation. An ideal standard of form is established, to attain which is perfection; every approach to this standard among seedlings is taken advantage of, and seed is saved from such varieties till the desired form is attained, to which must be united colour and substance. An excellent example of this is the Pansy, or Heartsease, where the transition from the poor little Viola tricolor to the large, round, thick petalled, and high-coloured flowers of the present day shows what may be done by the skill and perseverance of the florist. Breeder Tulips are those which are raised from seed, and selected from having straight stems, well-formed cups, with clear bottoms, and petals of good substance; these are grown with their offsets till they break into colour.*—*A Subscriber.*—Fuchsias are generally divided into light and dark varieties, according to the colour of their tube and sepals; thus crimson or red forming the dark, and pink, approaching to white, the light class. A third division might be made of those with light-red, or rose-coloured tubes; but it would be difficult to divide them further.*

SEEDLING FLOWERS.

Calceolarias.—*A Lady.*—Both the seedlings sent are well formed flowers, prettily and distinctly blotched with brown; but in this quality they do not differ from many varieties produced during the past season. The specimen with a lemon ground must be described as long blotches; had they been stripes, the narrow end would have been pointed towards the upper part of the flower. We have seen but one decidedly striped variety.*

Fuchsias.—*W. M.*—Both your seedlings are handsome plants, of fine growth, and blooming freely; but the flowers of both are faulty in having too much colour in the tubes and sepals, and too little in the corollas. 2-44 is the better of the two, but neither of them are equal to many of the light varieties generally cultivated.*

Pansies.—*T.*—No. 1, a large flower, of good substance, fine in its general form; good eye, but the bordering on the lip faint and imperfect, compared to the side petals. 2 is also a flower of good form and substance, with sulphur ground-colour, purple top petals, and a broad margin of the same colour surrounding the lower petals. They are both good flowers, but possessing no particular novelty.*

*** As usual many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

Erratum.—Messrs. Gray, Adams and Hogg's Advertisement, was by mistake last week placed among the Sales by Auction.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park-st., every article required for the construction of Horticultural buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

The Agricultural Gazette.

Nov. 26—Framlingham.
Rayleigh.
Isle of Thanet.

THE present is the season during which most of our FARMERS' CLUB ANNUAL REPORTS are published. When they are well compiled, few publications are more useful. The hard-earned, and often dear-bought experience of practical men is well worth attention and study; the resolutions of Farmers' Clubs on the various topics of Agricultural interest which have been discussed by them during the year, certainly deserve publication at the end of it.

It should, however, be remembered by those who have the charge of these compilations, that opinions on points of farm-management, however fairly deducible from well-established facts, are rarely of extensive accuracy. This will appear to any one in the habit of attending Farmers' Club Meetings, from the acknowledged agricultural skill and success of many who differ widely in their views on some of the simplest matters connected with their business. The same effect will not follow the operation of the same cause, unless it act under similar circumstances; and the causes which the farmer puts in action are influenced so much by soil and climate, both of which are notoriously variable in this country, that the great variety of opinion to be met with on the practical details of farming is not to be wondered at. All this, we say, should be considered by those who undertake the preparation of these Annual Reports, because it appears to indicate a method of greatly increasing their value.

In another column of this day's Paper, we have referred to the necessity of combining with accounts of agricultural practice, statements of the circumstances under which it occurs—the propriety of so doing is indeed sufficiently obvious from what has been already said—and the suggestion applies with no less suitableness to the publication of opinions as expressed in the resolutions of Farmers' Clubs—opinions of which agricultural practice is just the embodiment. In reading a Report of a Farmers' Club, prefixed to which there was such a statement—one descriptive of the climate, soil, and general agricultural character of the district to which it referred—any person would be able to judge of the applicability to his own case of the opinions therein expressed; and he would hazard no loss by attempts to act upon them, under adverse circumstances.

Doubtless the primary object of Farmers' Clubs is, with each, the agricultural improvement of its own locality; and this, in the present form of their Annual Reports, is all they are calculated to effect. Their present isolation is a necessary consequence of unexplained differences of opinion—differences which would be satisfactorily accounted for by the circumstantial appendices we are recommending.

Next to the publication, for the benefit of second and third-rate cultivators, of what is found to be profitable practice in the best cultivated districts, it should be the object of Farmers' Clubs to exhibit the details of farm management to the scientific man. Unquestionably Agriculture is capable of great improvement by the adaptation of it to scientific principles, which cannot be done by people ignorant of farming; and it needs but little consideration to see that these accounts of soil, climate, and other circumstances affecting the practice of farmers, will render the differences of opinion existing among them instructive instead of puzzling, or perhaps disgusting, as they might otherwise be.

These remarks, which we hope will receive the notice of SECRETARIES OF FARMERS' CLUBS, are introductory to a request which we have now to make to them; and perhaps our readers will kindly assist us by calling their attention to it. It is our aim to be as far as possible the organ of these Societies, and to publish the facts adduced and opinions sanctioned by them. We should feel greatly obliged to their Secretaries if they would forward to us information on the following points:—The name and locality of the Society, its object, its times of meeting, and the subjects, if they have been fixed upon, for discussion during the ensuing year, and a report of discussions during the past year. If to such information, statements were added of the climate, elevation, soil, and general agricultural character of the several districts, we should be enabled to collate and correctly to appreciate the opinions indicated by the mass of information which would be accumulated.

Such an attempt to centralise the numerous but unconnected efforts which are now making in the cause of agricultural improvement, if it were successful, would probably be useful.

ANOMALIES OF AGRICULTURE.—CHAP. II.

(*Continued from page* 738.)

THAT he who will have most dealings, and be brought most into contact with Nature, should of all men be taught most about her, would seem an axiom; and he who is not ambitious of the character of "a powerful demonstrator of undisputed facts," might be well content to leave it as it stands, and not waste his own or his readers' time by enforcing or attempting to illustrate what seems self-evident. But in this motley crowd of life we daily find that what is Truism to one man is Paradox to another. And though the generality of our readers might at once admit the proposition, the fact is, that those whom we are most anxious to reach, and who are, if they only knew it, the most deeply interested in the matter, are *not readers at all;* and we are thus placed in the same category with the sign-post which in giving minute "directions for passing the ford" concluded with an "N.B.—Them as can't read had better go round by the bridge." Here is our difficulty; here is the leading and glaring "anomaly" indeed, of the "most ancient of the arts;" that the artists—seven tenths of them—do not read at all; and do not only believe, negatively, that no reading in the world could teach them one iota about their trade which they do not know already; but do also hold, positively, that there is some latent, poisonous, and pernicious quality about books, in its nature detrimental to the character of a "practical farmer." Nobody that has ever studied the phenomena of *mere* practical knowledge can wonder much at this. It is a fact universal and notorious in all the arts: the self-taught believes in no discoveries but his own: you cannot make him understand that the facts to be found in books are the concentrated and digested records of the experience of other men—as clever, as practical, as knowing as himself. The mere fact of its being *a book*—printed in harmless words instead of being deep-engraved in the damage to his pocket of failures and errors that he might have been warned against by the most ordinary instruction—is enough to make him turn an ear deaf as the deaf adder. He has heard his father or his grandfather say that *book-farming don't do;* he has never *learnt how to learn;* and want of early exercise leaves the mental muscles unused and rigid. He does not understand that Education does for the mind pretty much what Tanning does for leather; it renders it tractable and susceptible of impressions, prevents clumsiness and induration, prolongs and increases utility, and defers decay. Therefore is theirs the heavier task, and the more manfully to be undertaken and zealously carried out, who would fain see the *science* of Agriculture flourish in their own generation, and shed its irresistible and ameliorating influence upon cotemporary practice. The "gigantic strides" that this art, in common with every other, has already made, since Science has in some degree been allowed to take the helm, "small as they may be, compared with what might be done,"* afford ample earnest to warm the hope, even of the sanguine.

Few of the fables of Antiquity are more elegant in conception, more true in philosophy, than that which represents Minerva to have sprung from the brain of Jupiter, full-armed and full-grown. The Arts, it will be remembered, were presided over by Mercury, as ordinarily begotten a young caitiff as ever Fancy pictured. Noted in youth for nothing but incorrigible mischief, he at last grows into a position of subordinate service, is made to fetch and carry, and there it ends. But the Goddess of Wisdom and Science, the offspring of a higher and nobler species of generation, bursts at once into perfect life, perfect form, and perfect caparison. Art, ever childish and immature, passes on the same from century to century, scarcely improving, or caring to be improved. To Science, one day is as a thousand years; analytical truth revealing itself before her Ægis, soon assumes the form and proportions of synthetical instruction. She collects inductively the scattered and detached *facts* furnished in the rough by the practice and experience of thousands; she arranges and classifies them into a distinct and successional series, following surely and deductively one from the other; and the chaotic mass assumes the clear and symmetrical outline of a living creation of defined truth, tangible by reason, and applicable by skill. Be the subject-matter what it may, the result is in every human heart the same. Be it Navigation upon the sea, or Agriculture upon the land; be it the marshalling of an army or the direction of the labours of a farm; still the mind prepared by a comprehensive and scientific knowledge of its task will ever bear the mastery: and the boy-philosopher will astound the practitioner of years by an *à priori* knowledge of results, of which a life of laborious and blindfold practice had, unassisted, afforded to the latter only a confused and glimmering recognition.

Perhaps there has seldom been seen, in our own day, a more memorable evidence of this, than in the delivery of Dr. Playfair's Lectures,* two years ago, before the Royal Agricultural Society. The first occasion on which the recent discoveries of Liebig, in the physiology of assimilation and nutrition, and the causes of animal heat, were made matter of oral and applied information to the Agriculturist. Well do we remember the whispered exclamation of a knot of shrewd and intelligent farmers, just behind us in the lecture-room, on hearing their own hard-earned facts brought home to them, face to face, from a source as new as it was undreamt of. A man, who on awaking in the morning should find a Mushroom sprung up on his floor, would not stare at it with more inexplicable amazement than they did on the almost beardless Professor who stood before them. The scene was worthy of all commemoration. On the one hand were the stout yeomen of England, fresh from the practical labours of every description of soil. The pastures of Northampton and Leicester, the chalky downs of Buckingham and Kent, the new and the old red sandstone of Warwickshire and Hereford, the clays of Oxfordshire, and the shaly hills of the Gloucestershire Cotswold, and a dozen other different soils had there each their sturdy representative. On the other hand, supported and surrounded by a band of Nature's own, as well as of Society's Aristocracy, stood the young and learned chemist—the student of a master-science—modestly conscious of the possession of knowledge which required but enunciation to be valued, application to be proved. "What in the wide world *can he* tell us about fatting beasts?" was the unfeigned expression of many an incredulous face, the burthen of many a side-whisper. "It would be presumptuous," said the lecturer, "in any scientific man, however exalted his rank in science, to endeavour to instruct an assemblage such as this, or to recommend alterations in the practice of an art, which he has learnt in the closet and not in the field. But it may be permitted, even to the most humble cultivator of science, to examine the practice which you yourselves have perfected, and to point out the laws of nature upon which that practice depends." And as the youthful philosopher proceeded to lay bare, in the clearest and most intelligible language, the recent discoveries in physiology, which he had himself the proud task of translating into our own language, the look of distrust and the smile of incredulity vanished: the vital and obvious interest of the subject at once arrested every eye and every tongue. If there was a heart there—and many there were—that beat with enthusiasm in the cause of Science, that was indeed a moment of pure and disinterested gratification. From sources as unexpected as they were beyond suspicion for genuinely scientific fidelity, he announced and explained their own most treasured maxims of economical and successful "feeding," deduced and eliminated as the natural and necessary results of ascertained chemical causes. True it was, that many of the important results there advertised, were well known to many present as matter of the most advanced and skilful practice of the farmyard. But why was it that the more conscious they were of the practical truth of his deductions, the more the hearers were riveted, and the lecturer applauded? Because he showed them, with the fact which they did know, the why and the wherefore which they did *not* know: because he exhibited as a patent and apparent result tangible to reason and to argument, that which was before wrapped in the mystery of a mere arbitrary and isolated *fact;* thereby opening a vista of future application of the same principles to analogous cases. Then first it was heard stated as a sure and incontestable result of chemical principles that warmth and shelter form a quantitative equivalent for a certain and measurable portion of food: and why? for a reason as simple as it is beautiful: that the bodily heat of animals is the result of combustion—not metaphorical but actual, proceeding in the lungs without intermission during life, and derived from its universal cause, the union of oxygen with carbon; the former obtained from the atmosphere by the act of breathing; the latter supplied by the food through the organs of digestion to the blood, and brought into contact with the atmospheric air in the lungs; that by a manifest consequence, the greater the amount of food consumed *as fuel* for the defence of the animal against external cold, the greater the resulting demand upon the provender, for the purposes of nutrition.

It would be beyond our purpose to advert even to a tithe of the facts brought to light or explained, in the course of those invaluable lectures; but we cannot forbear to point to one more as instancing the applicability of experimental Science, even to the most ordinary and familiar economy of the farmyard. It had been frequently observed, and is so to this day, by dairy-farmers, that the cheese made from the milk of cattle "soiled up" turns out of inferior quality to that from the same animals when pastured; whilst the milk, cream, and butter, are greater in quantity, and equal in quality. Now Chemistry explains to us that the production of *casein* (the principle of cheese), is favoured, and indeed only perfectly performed when the animal is in motion; that in fact its peculiar quality depends upon the exhaustion

* Baron Stanley's speech at the recent meeting of the Liverpool Agricultural Association.

* On the Application of Physiology to the Breeding and Rearing of Cattle.

by exercise of a certain portion of the animal tissues, which in a state of perfect rest would all contribute to the lacteal secretion. Even during the very week in which we write, a query is addressed to the Editor of a cotemporary Agricultural Paper, asking for an explanation of the observed deterioration of the cheese from stall-fed cattle. A very slight acquaintance with organic Chemistry would have cleared up, as indeed it has long ago done, this otherwise inexplicable phenomenon; and have at once decided the dairy-farmer, whose object was the manufacture of cheese, upon the adoption of a different system of treatment of the animal to that pursued for the purposes of milk and butter.

We have adverted to these cases, not for their own sake as facts, because we conceive them to be familiar to most of our readers; but merely as instances in proof of the successful application of some of the most recent and important discoveries of modern Science to the art of the Agriculturist. It will be our future object to point out, in more technical detail, the particular science applicable to each department of the farm, with the more especial purpose of exhibiting those anomalies of procedure which have kept in a state of backwardness and empiricism the first in universality and importance of human arts, believing as we do that its grateful susceptibility of the highest energies, has been overlooked only from its being, under the Wisest Dispensation, not entirely inacessible to the lowest development of human intellect.—*C. W. H.*

CULTIVATION OF WHEAT ON THE SAME LAND IN SUCCESSIVE YEARS.

(*Continued from p. 754.*)

Having detailed the general results of the experiment, I beg to offer the following remarks upon some points in it, which seem to me to require a little elucidation.

I consider the success of this experiment to be in a great measure owing to the use of *soluble* silica and magnesia; because, although there is an abundance of silica in the soil, my first crop showed very miserable results, the grain being ill fed and poor, and the straw soft and discoloured, although the year 1842 was, in this district, very favourable for Wheat, the month of August being singularly fine and warm; but when I combined the nitrate of soda with sulphate of magnesia, as in experiment No. 1 in 1843, but still more when I combined it with the silicate of soda, as in No. 3 of that year, the straw became as strong, firm, and bright as need be desired; and this year, when both these salts are combined with nitrate of soda, common salt, and gypsum, I have not only good and bright straw, but also an abundant crop of Wheat.

With respect to the lime used, it may be as well to state that the field had not been limed for many years; and although in a limestone district, showed a deficiency of lime on analysis. The soil is a strong loam, on a brick clay subsoil, in which there is little or no lime, although the stony clays which form the subsoil in a great part of the district abound in it, containing from 20 to 30 per cent. of carbonate of lime. I had always believed that lime was used in great excess in this neighbourhood, and had, in fact, an idea that its good qualities were over-rated, inasmuch as it does not enter into the composition of the plant, except in very minute proportion; but last winter I saw a paper (by Mr. Briggs, of Overton), on the possibility of growing Wheat on the same land year after year, in which the utility of lime in preventing rust was incidentally touched upon. I also saw Liebig's Letters, explaining the action of quick-lime in liberating potash from the clay; and then I considered it very important to ascertain the proper quantity to be applied. The quantity required to decompose the phosphate of iron was not great; and, assuming Liebig's theory of its action in liberating the potash to be true, it seemed to me that an excess of lime would permanently impoverish the land; for, supposing that the crop required 100 lbs. of potash, and as much lime was applied as liberated 500 lbs., what became of the 400 lbs. which did not enter into the composition of the plant? Was not a large portion of this 400 lbs. washed down the drains by the rain, and so lost for ever? Perhaps the absence of lime in this field accounts for its beneficial action in the experiment just detailed; but if my supposition is correct, that any excess of potash which may be liberated from the clay by the use of quick-lime (that is, any more than may be required to perfect the crop), is washed down the drains, and thus the land is permanently impoverished by the excessive use of lime, it behoves landed proprietors to ascertain what is required, and they should take care to apply no more than is necessary. This caution is particularly needed in this neighbourhood, where lime is cheap, and where the opinion is prevalent that the more there is applied the better it is for the land, and where it is common to apply ten or twelve tons to the acre.

I have stated above, that chemical manure was applied to a small portion of the field after the setting-in of the drought in April. The action of this manure showed that a good thing may be very injurious, if applied at an improper time; for, although it produced a stimulating effect on the plant immediately after its application, there was too little moisture in the land to dissolve it thoroughly, and thus enable the plants to appropriate it, until the rain came, about the end of June, when the Wheat had been in flower some time; but the stimulus was then so great that all the plants threw up fresh stalks (from the roots), which were in flower when the Wheat was cut; and it was then found that they had not only impoverished the plants, but had prevented the grain from ripening. This was the case not only in the experimental field, but in several others also, where the chemical manure was sowed after the setting-in of the drought.

When the field was sowed with guano, it was thought desirable to cover one part of it with the African, and the other with Peruvian, for the sake of comparison; but, as the African did not appear to produce the same stimulating effect as the other, 50 per cent. more was applied, that the *cost* might be equal (the Peruvian cost 10*s.*, the African 7*s.*, per cwt.); but, as this latter application of the African was made when the Wheat was just shooting into ear, the same objection applies to the experiment which does to the chemical manure applied after the drought had set in, namely, that there was not sufficient moisture in the soil to dissolve it thoroughly, until the plant was too far advanced to benefit by it; and therefore its failure would be no proof of the value of the African as compared with the Peruvian, which was the object of the experiment. It is true, no bad effects followed the application, similar to those produced by the misapplication of the chemical manure in dry weather; yet, if soluble salts, like the latter, did not find sufficient moisture in the ground when applied in April, there is reason to suppose that the former would not do so when applied in May.

I regret the failure of the experiment without any manure, as I think the result would have shown satisfactorily that the land is so far from being impoverished by this system of cropping, that it is improving every year. I think, however, that this is shown by the produce of the land manured with guano alone. In the first year's experiment, the produce from guano alone was 27 bushels per acre; and both straw and Wheat were very indifferent in quality. This year, the produce from guano alone is 42½ bushels; and although neither straw nor Wheat are so good as upon the adjoining lands, they are both very much better than they were in 1842.

It will be observed, that the result from the unsubsoiled portion is very good; and, if nothing more were said about it, people would be led to conclude that there was no advantage in subsoiling. But this, in my opinion, would be a great mistake; for, to say nothing of the advantage which the unsubsoiled portion would derive from the drainage which it received from the subsoiling on each side of it, I found, when the field was ploughed up this autumn, that, whilst the unsubsoiled portion was stiff and heavy, the subsoiled part was comparatively friable and loose, like a garden, and will, I expect, show its superiority in the succeeding crops.

It must be borne in mind, in reading these experiments, that we have here one of the most unfavourable climates in the kingdom for growing Wheat, from the excessive quantity of rain that falls,—three times more rain falling annually in the north of Lancashire than at York; and this, no doubt, is very prejudicial to the success of such a series of experiments as I have been detailing.

It has been objected to these experiments, that, allowing all to have been done which is here detailed, it leads to no important conclusion; for, although it may be practicable to grow Wheat every year, in a small field like the one experimented on, it is not so on a large scale. But the objectors should remember, that there is not the seed of a single weed sowed with the manure; and, therefore, if the land is thoroughly cleaned, and kept so, by hoeing the crop in the spring, it will require very little labour to fit it for another. But I shall be better able to speak on this head next harvest, having sowed Wheat on an Oat stubble, with one ploughing. It is said there are no weeds in Chinese husbandry! and if they can eradicate them completely, so may we, if we adopt the same methods, and follow them up as perseveringly.

Again, admitting that it is not practicable to grow Wheat on the same land every year on a large scale, yet, if we can double the crop in those years in which we do grow it, by the application of chemical manures (and the same manures are applicable to all cereal crops), will not that be a conclusion worth arriving at? That it is possible to do so is, I think sufficiently shown by the results which I have obtained. What, then, may we expect when these experiments are infinitely multiplied and varied, under the superintendence of skilful and experienced men, who will devote their whole time and attention to the subject? Will raising the average produce from 25 to 50 bushels per acre be the utmost limit to which improvement can be carried? I believe not!

In conclusion, I would urge on all owners and occupiers of land, the importance of devoting at least a small field to agricultural experiments; as I think there can be no doubt that, if these are carefully and systematically made, and followed up by agriculturists generally, we shall be so far from needing an importation of Corn in average years, that we shall have a large surplus to spare for our neighbours.—*T. G., Clitheroe.*

VILLAGE ASSOCIATIONS.

Observing that you have taken up the subject of the Allotment System and the improvement of the condition of the agricultural labourer, I am induced to hand you a proposition for the formation of a Village Association, having the same objects in view. You will perceive that it is not in a form for publication, but I think matter may be extracted from it available for general purposes. The establishment of Village Shows for Horticultural and Agricultural Produce of the simple nature proposed, I conceive to be a means of getting at the hearts of the labouring people, and gaining their goodwill towards Associations for their benefit, in which they might eventually be expected to feel a personal interest.—*J. C., Parkhurst, Bexley, Kent.*

[In the following extracts all local names are omitted.]—"In every large village, or circle of small ones, throughout the country, Associations might be established, with a promise of the greatest advantage, in rousing and exciting a spirit amongst the gentry and landed proprietary, to combine with their own occupations and pursuits the interests of the poor and the public benefit, and to promote the general improvement of the villages in drainage, school, bridge, and other buildings, road-making, affording small allotments of land to families, and many other works that do not come under the immediate cognisance of the parish. No rights or interests would be infringed. The expansion of the taste for Horticulture, where there is so good a motive to promote it, would bring business to the nurseryman, in the use and cultivation of whose stores additional husbandmen and labourers must be employed. In the allotment of small portions of land to families, resort to public-houses would be diminished, and the industrious classes generally, being brought more into contact with the higher orders, would imbibe a better feeling towards them, and might be influenced in the most beneficial manner by the example of their superiors. Although the object of the Association in this parish is to better the condition of the agricultural labourer in particular, its influence, it is hoped, will extend to the adjoining village of ——, where large and flourishing manufactories exist, whose proprietors not only promise their countenance and support to it, but who may also be expected to devise similar measures adapted to promote the benefit of their own people, as a means of averting the evils consequent upon a period of stagnation of trade. It is presumed that by such Associations the landed proprietors will be best enabled to ascertain the real wants of the industrious labouring class, and to judge of the best means of improving their condition; and no measure combining interest and pleasurable pursuits could be adopted with more promise of gaining their good feelings and affections, and of elevating them as a body essential to the prosperity of the country. in the present order of things, when so many subjects are being agitated to distract their attention from industrious and orderly habits, and to blind them to their own true interests."—*J. C.*

As might be expected, doubts having been expressed as to the practicability of establishing an Association embracing so many objects, and that it would probably be opposed by nurserymen and market-gardeners in particular, the following communications on the subject may be deemed satisfactory:—

From a Nurseryman at Foot's Cray.—"I have carefully perused your Paper on the improvement of the condition of the different labouring classes in the parish of ——, and think them generally good and well meant, if you could but bring the parties themselves to carry them properly out. On the drainage of the village there can be but one opinion as to its utility, and the good it would be to the labourers in giving them employment for a time. I also think the Show system would have a tendency to raise a spirit of industry in the cottagers of all descriptions, and doubt not of its success in —— With regard to the allotment part of the plan, I fear the same success would not attend it as if the parish were 100 miles from London, as I think it will only answer in poor counties, where the labourers' wages are low."

From a Nurseryman at Dartford.—"I return your Papers, and am much obliged by the sight of them, especially as they are connected with so admirable an object, the relief and well-being of the poor. I have long wished some good man would take up the very same subject. I am quite certain we cannot prosper collectively as a people till the poor are well employed. I wish you success in your plan, and hope you will not be dismayed by any obstacles thrown in the way of it, which you may expect to experience. I shall be happy to aid and assist in any way I can to promote your object."

PROPOSED ASSOCIATION.

Having for its object the Drainage and General Improvement of the Village, combined with the Employment and Encouragement of the Industrious Labouring Class.

The Society is intended to consist of two classes of members, with a treasurer, and secretary or clerk, in addition to such persons as are desirous to become patrons. One from each class of the members will act for the year in rotation as president and his assistant, and will make awards and manage the general business. These offices for the present are not intended to involve any expense.

The amount of subscription of members of the first class would be half a sovereign and upwards; and of the second class half-a-crown and upwards; but donations and subscriptions of a higher amount than specified would be acceptable.

One means of augmenting the funds would be to establish periodical Shows (not confined to members) of flowers, fruit, vegetables, and other produce, on the principle that all should be sold for the benefit of the Society. An exception to this rule, however, should be made in the exhibition of rare and valuable productions, which the owners might be disinclined to part with, by requiring an almost nominal fee for whatever they may send to the Show with the wish to reserve from sale.

Although the drainage of the village and the encouragement of the industrious labouring class are brought forward together, the rejection of the one object need not interfere with the adoption of the other.

Perhaps the most important recommendation in support of the drainage, which would involve so large an outlay, is the blessing of health and comfort it would bring to the inhabitants, who frequently suffer from fevers of the worst description, owing to damp in their dwell-

ings, and the stagnant state of the drains, cesspools, &c. The foundations of most of the houses are much below the level of the roads, from being originally low, whilst the roads and paths have been raised from time to time. An example of the efficacy of thorough drainage by sewer may be seen in the suburbs of London, on the Surrey side, which, from being constantly infested by fever, have been rendered by this means comparatively healthy.

Lastly, it may be noticed, that this parish possesses a population of a rural and agricultural character, many of the inhabitants having either their farm or field. The labouring class is unvarying and scarcely fluctuating in number, and those (chiefly the young) who do roam in search of employment, are invariably observed to return to their native place, and no doubt, with full occupation and a proper direction of their energies, would improve and come into orderly and industrious habits.

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Cultivation of Turnips.—The era of agricultural improvement in East Lothian may justly be dated from the introduction of Turnip husbandry, which was, it appears, partially effected about the year 1760. The extent of real Turnip-soil in the county is not great; but from the effects of judicious drainage on the soil, and the employment of efficient implements in its preparation, farmers are now enabled to cultivate this valuable and indispensable root to an extent, and with a degree of success, scarcely to be surpassed in any other district in the kingdom.

There are several varieties both of the Swedish and common Turnip in general cultivation: of the former species the purple-top kind is most esteemed and chiefly grown; and of the latter the Dale's Hybrid, Green-top Yellow, White Globe, &c., are the kinds generally cultivated.

As the greater portion of the soil is naturally unsuited to Turnip husbandry, much labour and attention are necessarily bestowed on the preparation of the land. The first ploughing is given immediately after the labours of the harvest, and the Wheat-sowing after fallow, Beans, and Potatoes, are concluded; in which state the land remains until the spring Corn-crops have been sown, and the Potatoes planted, when it receives a second furrow, sometimes in a contrary direction to the previous one, but more frequently along the ridges, reversing the former furrow-slices. It is then repeatedly harrowed, rolled, and grubbed in various directions, for the purpose of pulverising the soil, and of dragging to the surface, and disengaging from the indurated clods of earth, the roots of Couch-grass and other weeds, which are carefully gathered into heaps, and carted off to some convenient corner of the field, where they are subsequently formed into a compost with quicklime. A third ploughing is then bestowed in a direction traversing the last one, and the other operations of harrowing, rolling, grubbing and weed-gathering, are repeated as before. The land is generally ploughed once more, and the subsidiary operations again resorted to; after which it is, in most cases, in a suitable condition for being formed into drills; but as the great objects aimed at in preparing land for Turnips are the minute pulverisation of the soil, and the thorough eradication of weeds, the different operations must be persevered in till those purposes are attained. During this preparatory tillage much attention is necessarily paid to the state of the weather. Should it happen, as it not uncommonly does, to be droughty, the harrows closely follow the plough, in order to catch the land in a particular state between wet and dry, when it readily crumbles down. The roller immediately succeeds the harrows, for the double purpose of further reducing the clods and of preventing the evaporation of the moisture in the soil. This is a part of the process particularly attended to. Another point regarded as equally important is, that the land should never be ploughed or otherwise worked while in a wet state, unless under peculiar circumstances. As already intimated, great difficulty is experienced in preparing the land on many farms for Turnips in wet weather, while in droughty seasons the moisture is so effectually worked out of the soil before it can be brought to the requisite degree of pulverisation, that small seeds, as those of the Turnip, cannot possibly germinate in such an unfavourable bed till stimulated by copious rains. With the view of surmounting the difficulty experienced in reducing strong adhesive clay soils to a suitable condition for Turnips, some farmers give the land intended for that crop a thorough autumn tillage, the drills being formed and the dung covered in the usual manner; in which state it remains until the proper period for sowing the seed arrives, when the soil is invariably found to be in a highly pulverised state, from exposure to the winter's frosts. Several farmers, however, while admitting that the plan of preparing stiff clay land in autumn is beneficial, inasmuch as it renders it sufficiently fine for the reception of the seed, yet contend that, from the land lying so long unploughed, the succeeding Wheat or Barley crop must be inferior.

The soil being sufficiently prepared, the drills are formed in the manner described in the case of Beans, the common plough being generally employed. A drill is formed for the reception of the manure in passing in one direction, and another is reversed, covering in the manure in returning in the contrary direction. Only a very short interval elapses from the formation of the drills until the manure is covered and the seed sown, with a view of retaining the moisture of the soil and manure. 26 to 27 inches is the usual distance between the rows. The manure chiefly applied to this crop is well-fermented farmyard dung, carted from a heap in the field, and distributed along the hollows of the drills in the manner already described. Other manures, such as bone-dust, Rape-dust, guano, &c., are also employed; the quantities of each given per acre, and the mode of applying them, have been noticed when treating of the management of manures.

The seeds are sown by a machine which sows two drills and compresses the soil simultaneously; some farmers steep the seeds, especially those of the Swedish Turnip, in water before sowing, in order to induce quick vegetation. As a preventive against the ravages of the fly, a small quantity of the flowers of sulphur is sometimes sown with the seed. The quantity of seed allowed to the acre is from 2 lbs. to 2½ lbs. Swedish Turnips are sown from the 10th to the end of May, and the softer kinds from the 1st to the end of June; but no certain period can be specified or adhered to for sowing the seed, as so much depends on the state of weather, and the condition of the land; the sowing is sometimes not wholly finished till the middle of July. It is usual, on some farms, to supply one of the seed-boxes of the sowing-machine with Swedish Turnip-seed, and the other with Dale's Hybrid, or some of the other yellow kinds; two contiguous drills of each kind thus alternate over the field. This plan is adopted only when it is intended to consume part of the produce on the ground by sheep. The Swedish Turnips are taken up and carried to the cattle in the yards, and the others left for the use of the sheep.

When the plants have assumed what is termed the rough leaf, the hoeing and thinning processes commence. A drill-grubber, or horse-hoe, provincially termed a scraper, is passed along the intervals as near to the plants as may safely be done; the hand-hoers immediately follow and single out the plants to the proper distance—8 to 10 inches: boys and females of all ages and sizes are employed at this operation. There are several plans of arranging the hand-hoers, so that none of them may impede the other, nor tread upon the plants in the drills just finished. Instead of each taking the drill next to the person immediately preceding, it is usual to place them at two or three drills apart; some time is also evidently saved by this plan at the extremities of the rows, as the hoers have their next drill at hand. Another plan is, to arrange the band in a semicircular order, the individuals in the centre taking the lead, and the others following at a short distance from each other. As soon as the whole crop has been once horse-hoed and thinned, the part first gone over will be ready for a repetition of the same operations; but at this stage it is only necessary to hand-hoe the sides of the drills, pulling out any superfluous Turnips with the hand. The after culture is terminated by passing the plough along the intervals, for the twofold purpose of making a channel in each for carrying off superfluous moisture, and of raising the earth up to the sides of the drills; but this last operation is not held to be indispensable, and is therefore frequently omitted on dry land.

A large proportion of the Turnip-crop is consumed on the ground by sheep confined by means of netting; three or more rows are taken up for the use of the cattle, and the same number left to be eaten by the sheep. The stock kept for this purpose are, for the most part, purchased at Falkirk Tryst and other markets in autumn, and sold off when the Turnips are consumed. Many farmers, however, prefer letting the greater part of their Turnip-crop by public roup (or auction), to dealers and others, or by private bargain, at a certain price per acre, or an agreed rate for each sheep weekly. Swedish Turnips are found to be a very wholesome and nutritious article of food for farm-horses, and accordingly a limited allowance is given uncooked to each, after the work of the day is over. Black cattle are invariably fed in open fold-yards, provided with sheds to which they may retire for shelter in bad weather. The Turnips with which they are fed are taken up by the women and boys formerly employed at hand-hoeing, and after being divested of their leaves and tap-roots, they are carted to the yards for the use of the cattle, the leaves being generally scattered over the ground and afterwards ploughed in. The practice of taking up and storing considerable quantities of Swedish and common Turnips as suitable opportunities occur during the early part of the winter, is deservedly extending, and will shortly become general. This plan is resorted to with the view of providing a supply for frosty or stormy weather, when the pulling and carting of Turnips would be attended with much unpleasant labour, besides injury to the land; but, perhaps, the principal advantages resulting from storing this crop before winter are, that the land may be cleared and prepared for Wheat, or ploughed up and exposed to the mellowing influence of the winter's frosts, preparatory to a crop of Barley, while the Turnips are always in good condition and at command for the use of the stock. The usual method of storing Turnips is as follows:—The bulbs, divested of their leaves and tap-roots, are carted to some convenient situation in the stack-yard, and made up into oblong heaps, from 8 to 10 feet wide at bottom, and raised as high as the Turnips can be conveniently piled. Dry weather is, of course, selected for this work, and, unless an adverse change is apprehended, the heaps may remain uncovered a day or two; they are then carefully thatched with straw, and firmly secured with straw ropes. Swedish Turnips stored in this manner, in a dry and clean condition, in November and December, are found to have lost but a comparatively small proportion of their original weight and nutritive qualities in the months of March and April following. There is another practice not unfrequently adopted, of covering the Turnips in the drills by passing the plough along the intervals, and raising the earth over the bulbs, which is found to be a good defence against extreme frosts. Swedish turnips are generally taken up with the plough, which is decidedly the cheapest and most expeditious plan. The bulbs receive a good harrowing before being collected and carted off the land. It may be proper to mention that many of the farmers raise a considerable portion of the Turnip-seed required for their own farms.—*T. Sullivan.*

Home Correspondence.

Allotment System.—I have observed with much satisfaction, that in several of the recent Numbers of the *Gazette* observations have appeared in furtherance of the allotment system, which, under good regulations, has always appeared to me to be one of the most desirable methods which can be devised for bettering the condition, both mental and physical, of the labouring classes. Those contained in the Number of Saturday, Oct. 19, appear to me to challenge some observation, inasmuch as it is evident that upon the well working of the system depend all its benefits. I observe that, from some accident, you have fallen into the error of stating that a Bill introduced into Parliament by Mr. Cowper, during the past session, had passed into a law. Such is not the fact; the Bill was introduced and laid on the table for future consideration, and there, I hope, it will lie for ever, because it appears to me that this is a subject peculiarly ill-adapted for legislation; and further, the Bill contains within itself propositions which, if carried, will, I think, strike a death-blow at the system. It is not my intention now to enter into a critical examination of this Bill, but there is one part of it which I cannot pass without observation. It is needless to inquire as to the causes in which it originates, but every one whose lot it has been to have much intercourse with the labouring class will be quite aware that, stolid and uneducated as they appear to be, they have their full share of mother-wit, and that suspicion of the motives and objects of those who take an active part in matters connected with their interests, operates upon their minds in full sway. Whatever we propose for bettering their condition must, on its very surface, display the absence of self-interested motives, and if this be not carefully provided for, the parties on whose behalf we are labouring will be the very first to attempt to defeat us. Now it appears to me that this Bill of Mr. Cowper's on the face of it provides a very fertile source of such suspicion, for it proposes to enact that any surplus arising after the discharge of all expenses, shall be paid over to the overseer in aid of the rates (*vide* section 25); and the result, I am firmly convinced, will be that the labourer will at once say, "A very pretty scheme truly, to relieve the farmer's rates by the produce of my labour!" and we can easily divine the result. Besides the itch which prevails for legislation, another curse of the present age is the rage for Societies; nothing can be done but by a Society, with all its train of committees and sub-committees, treasurers, secretaries and collectors. Some little practical acquaintance with the subject, and considerable observation of the working of the system, has served to convince me that the less public interference there is in it the better; no fixed system will adapt itself to the necessities of every parish; and I am satisfied that the best method of getting it into general action, and making it conducive to general utility, is to leave it as free and unfettered as possible; to let it spring from a spontaneous desire on the part of the owners of property, whether lay or clerical, to benefit their poor neighbours; that they should work it in their respective localities entirely according to their own knowledge of their wants, and the best means of applying it, without the intervention of rate-payers or any officials whatever. I cannot at all coincide in your view of a meeting of the inhabitants (parish meetings are proverbial), or of a committee and sub-committee; the only committee required is an owner with property he is willing to let for the purpose, and the clergyman of the parish, who knows the circumstances, characters, and wants of his parishioners, and can at once, without the intervention of other inquirers, afford all the information and advice wanted in furtherance of the benevolent design. With reference to the management of the allotments themselves, the fewer the rules and regulations with which they are clogged, and the more simple those rules, the better. The best method for insuring good cultivation is affixing a rent which, *primâ facie*, may appear rather a high one, but which (when it is borne in mind that allotments are small, and all good land—generally very near the occupier's residence; and that there is no averaging of good and bad land, of long and short distances, for expense of cultivation; and that, as is well known, under the spade land will throw out an enormously increased produce) will only appear to be a fair remuneration for expense incurred and accommodation afforded, while it tends to insure active exertion in their cultivation. In the commencement of the system its advantages ought, in my opinion, to be exclusively offered to persons of known good character and conduct, and the moral effect produced upon others by the discouragement thus afforded to intemperance and irregularity will speedily develop itself. In the observations contained in the concluding paragraph I entirely concur, and I hope the time is not far distant when we shall see spontaneous exertions in favour of the honest and industrious amongst the labourers in active operation in every parish; and I trust that in this case the state of their habitations, and the enormous rents they are too often called upon to pay, will excite their full share of attention.—*E. J. H.*

Harvesting Carrots.—In your Paper of Nov. 2, you observe that the "women cut off the leaves." I beg to say, that cutting the leaves off is not the best method of

removing them. The following method is adopted at Studleigh, a place famous for growing Carrots of fine quality. The operator takes a Carrot by the tops, grasping them tightly as near the crown as possible, and holding the knuckles upwards; he then takes the body of the Carrot in the other hand, with the knuckles held downward; the Carrot is then sharply turned over the back of the hand which holds the green part, which separates nearly from the root, leaving a small conical crown only. The Carrots are stated to keep better than when the green is cut off, and the operation is performed in about half the time.——*Dibbles.*—Many years ago a description was given in the *Farmers' Journal*, of a method of dibbling Wheat, practised in Sussex (I think). The dibble consisted of an iron cone of 3 inches in length, inserted into a wooden handle with a T head, and of such length that a man could use it without stooping. The workman walked backwards, having a dibble in each hand, making a double row of holes in each furrow-slice, and being followed by children, who dropped two grains in each hole. The method was at that time stated to be effective, a considerable saving of seed was made, and the treading of the man and children was thought advantageous. A simple implement of this kind is much more likely to answer the purpose than the one described by Mr. W. Bartlett, which would be very likely to choak, if the land were moist, and would require a very level surface to work to advantage. I have used an implement like Mr. Bartlett's, for planting Mangold Wurzel, but I very much prefer the drill.—*Lusor.*

Repeated Cropping.—Notwithstanding all that has been said on the necessity of changing the kind of plant grown on the same soil, as essential to good husbandry, yet there are some soils which seem to contain an inexhaustible supply of the pabulum required for the successful culture of one species. I am well acquainted with a small garden, which has been planted with Potatoes for the last 55 years, and has always borne good crops, and those of very prime quality. The crop just raised is after the rate of about 17 tons per acre, chiefly of Kidneys and China Oranges, neither of which varieties are great bearers, as compared with many others; and in quality they are equal to any I have ever tasted. I saw the produce of one plant of a red variety, of which I am sure several of the tubers would weigh 2 lbs. each. The soil is a marly loam, overlying the mountain limestone. Of course, it has been liberally manured, from time to time, and has once or twice been dressed with lime, and occasionally trenched, as was the case last year. But this quality of certain soils to produce good crops of the same kind of plant many years in succession, seems not unusual; it is well known that much of the alluvial district of Somersetshire is capable of bearing good crops of Wheat, year after year, with undiminished fertility: I have been informed, by good authority, that 25 successive crops of Wheat have been taken from the same field, near Yatton; none of which were less than 30 bushels per acre, and some considerably more.—*Lusor.*

Grass Land.—I occupy some meadows in Hertfordshire—the soil cold wet clay; they produce a coarse Grass. The usual management for years past has been to mow every year, and feed afterwards with cattle and sheep. I can find no tradition of any dung ever having been put on them. They have of late been somewhat improved by imperfect bush-draining, and I intend in this and the succeeding year to drain the whole afresh with pipes, and am now rolling with a heavy roller to fill up the pits and holes made in a succession of years by the feet of the cattle; but though the tile-draining may, two or three years hence, begin to tell, what do you recommend in the way of surface-draining? Every dent of a cow's foot becomes a dish, which the first shower of rain fills with water, and it then remains a little pond. I keep no stock, the hay is consumed in the stable, and will hereafter be returned in the shape of dung and stable-draining from a tank; the aftermath is fed off by the stock of my neighbours, who hire the feed. This is but Cockney farming. I am desperately puzzled by my reading of the agricultural part of your Paper, and by the practical advice of my neighbours. It does not suit me to break up my meadows, which are ornamental as part of my grounds, and I cannot keep stock. I wish some of your readers would take my case in hand, and give me some reasonable advice. I suspect there are many in my situation to whom it would equally well apply, though I hope few have so refractory a soil to deal with. This last year's drought prevented my Grass growing till very late, and I did not mow till August, and the principal part of my crop consisted of hard-heads; the more apparent, as it had time to flower, and, I fear, in many cases, to seed. Is there any chance of partially extirpating this weed without breaking up the pasture? The nature of the root, I should fear, makes all attempts at pulling it up hopeless. Would a severe scarifying it, and sowing fresh seed, be of any use?—*Dodman.*

Acorns for Pigs.—Some care is necessary to be taken when pigs feed upon them, for otherwise they will be subject to a distemper; to prevent which, the best way is to moisten some Peas or Beans with water, and sprinkle over some antimony pounded and sifted, or a little pounded brimstone; if this be repeated two or three times a week, for one or two weeks, it will effectually preserve them from the disorder; or if the Acorns be collected and prepared in the following manner:—Dig a hole in the ground, in this let the Acorns be put, well moistened with water, in which a handful or two of common salt has been dissolved: in a few days they will begin to heat and sprout; observe them therefore attentively, and when they have made a shoot about two inches long, take them out of the hole and spread them to dry on a barn floor, and in a day or two they will be fit to give the pigs. This matter must, however, be managed with care and caution; they must not have too many given them at a time; at first, twice a day, say a quarter of a peck; afterwards three times a day. Nor should they while they eat this food be confined in a stye, but suffered to run at large; for if their liberty be too much abridged they will never thrive well, or grow fat on Acorns. Then to finish them off well, give them each about half a sack of Peas, and half of Barley meal, penned in the stye, with water for them to drink, which is always requisite in fattening. —*R. R.*

Action of Lime.—In the *Agricultural Gazette*, for January 27, Professor Sprengel writes:—"All crops grown after lime will ripen the sooner for it." We know by many years' experience, and scores of facts, that the contrary is the truth, and that all crops grown after lime invariably ripen later than if no lime had been used. In the next place he confesses his ignorance of the cause of "lime being injurious to fields that slope much towards the north." Now this is easily explained, because these fields, experiencing the least influence of the sun, are too cold of themselves, and by giving them lime we make them colder. Many facts have proved to us that the operation of lime, so as to do good to the crop for the first season, all depends upon whether that season be a cold wet or a hot dry one; for this makes all the difference, as in a hot dry season that continues for two or three months while the crop is growing, the lime manure will always show plainly its superiority over many other manures; while on the contrary, in a cold wet time on the crop's growth, most other manures have the advantage of the lime; indeed, in some such seasons, we think that the lime does an injury by its coldness.

Drainage.—In No. 3 of the *Gazette* Mr. Smith, of Deanston, spoke a very great deal in a few words, at the meeting of the Irish Agricultural Society. One thing I would remark, that the proper depth of the drains depends entirely on the porousness or tenacity of the subsoil; 18 or 20 inches deep for common furrow-draining may be enough where the subsoil is very tough and tenacious; but where the subsoil is pretty open or full of joints in the clay, or full of small sand-veins, then 2½ or even 3 feet will be better.—*A Leicestershire Farmer.*

Fullers' Earth.—A man at Bath, who rents fullers' earth pits, excavates them, and sells the produce to the cloth manufacturers in the neighbourhood, stated to me a short time since, that in excavating this earth he had had a good deal of the small at the mouth of the pit; which, finding it to be in his way, he distributed it over the adjoining field, where there was a young crop of Barley and seeds; that wherever it fell the crop was surprisingly flourishing. Having a great deal of this earth on parts of my hilly land, I shall try its effects next spring, notwithstanding I have a bank which was sloped off six years ago to improve a roadway which consists of a coarse bastard fullers' earth, and upon which not a root of anything green has yet made its appearance —not even a Thistle; but be it remembered that too much of a good thing is worth nothing. I know a man who, having only a meadow of 8 acres, put the whole of the manure of 8 horses on it until he killed all the Grass effectually.—*Della.*

Dibbling Wheat.—It is objected to dibbling Wheat, that labourers are not to be trusted in evenly dropping the seed. Perhaps the object might be better obtained by sowing the seed in drills, and thinning it out in the spring, when the weaker plants might be drawn. But I must insist that dibbling or drilling at 9 inches is neither scientific nor good husbandry: the rows should be at least from 18 to 24 inches asunder. I am firmly persuaded that at about that distance the produce both of Corn and straw will exceed in weight Corn sown at any other distance; it has also the advantage of giving a fallow, and will in the stirring of the intervals give much employment, at a time of the year when the poor are much out of work. How much better than factory work for poor children!—*J. M. Goodiffe.*

Guano.—Is it (as some suppose) the dung of birds or a fossil earth? Its being found in such immense quantities in different parts of the world, renders it almost impossible to believe that it is the former. It appears by a late No. of the *Times*, that the number of vessels now waiting to be loaded will bring to this country more than 100,000 tons; add to this the immense quantities yearly used in the different provinces of Peru, according to the accounts given in "Thompson's Alcedo." See the Appendix in that excellent work under the article "Huano," where it appears that considerable doubt exists upon the point, and they go so far as to say, "that naturalists have incontestably proved that it is a fossil earth."—*J. G.*

Potato Culture.—I took to a piece of orchard-ground the herbage of which was bad. It was breast-ploughed, and the turf burnt. Part of it was planted with Beans, and the remainder, after being once dug, was left for Potatoes. It was turned up in large lumps, and so continued till rather late in June, when seeing no prospect of rain, I had trenches made (the lumps, perfectly hard, being taken up and laid between), and whole Potatoes put in and covered with the ashes. So it continued until rain came, when the clods were broken up with a stock-axe. The piece then assumed a very different appearance. Soon after, more rain coming, the ground was again gone over, and very good work was made of it. The breaking up of the clods served to mould up the Potatoes. I must not omit to mention that the ashes were soaked with liquid manure before they were put over the sets. And here I would notice the decidedly beneficial effects which have followed the application of liquid manure in sowing seed. I had drills sprinkled with it for Vetches before depositing the seed, and the thickness of the plant and the rapidity with which it made its appearance above ground was surprising. The Potatoes alluded to are now being got up, and they prove a very fair crop of excellent quality.—*T. R.*

Kyanising.—Amongst the various timber preservatives, I would give the preference to Sir W. Burnett's for the use of a Buckinghamshire farmer. That of Kyan appears to answer the same general purposes, but is injurious to plants, is decomposed by salt water, and is more expensive in proportion to the relative value of zinc and mercury, of which these preparations are the chlorides. I have had a tank for the Burnett preparation for several years, but cannot speak from long experience. It certainly seasons green boards with a rapidity perfectly magical, and equally affects yarns and woollen. The particular uses to which a farmer would put it would be to season sacking, cordage, rick-cloths, and stuff for out-buildings, &c. A narrowish deep box might be made of 1½ in. deals for the purpose of taking in parcels of hurdles, or it might be built of masonry sunk in the ground with the mortar made and used quickly, and the inside rendered sound with Roman cement. Mine is made so, and answers very well. The above preparation appears to be adopted and used largely by the Admiralty, which seems to tell well in its favour. —*Micklewell.*

Cheap Method of Storing Mangold Wurzel.—As the present is the season for gathering and preserving this useful root, I beg to communicate an effectual and inexpensive method of storage, which several years of experience have proved to answer perfectly well. When the roots are taken up and ready to be stored, commence building a rick of Wheat-stubble, by laying the foundation some 8 yards long and 4 yards wide; when it is about half a yard high, place three or four cartloads of the roots in the middle, so as to fill up the whole of the centre of the rick to within 1 yard of the sides and ends; then continue to build up the outside with stubble, and the interior with Mangold Wurzel, as high as may be necessary. Lastly, form a roof to the rick by adding more stubble, till it is at least 2 yards thick upon the roots. It needs no thatch, as neither rain nor frost can penetrate so as to injure its contents. When the roots are wanted for use, a hole 3 or 4 feet wide should be pulled into the end or side of the rick, from which the roots can be taken a few at a time as they are wanted, without taking off the top covering, which will gradually settle down as the roots are taken from below, so as to form an arched straw house, which, with very little care, may be made to stand entire until the whole of the roots have been taken out as consumed. This plan will answer every desirable purpose; the roots will be found dry, and not at all grown, as but little light and air can penetrate into the recess, the entrance to which may be opened and shut with a hurdle, as the roots are required for use. Roots managed in this manner are stored just where they are wanted for cattle, and therefore once carting from the field to the stack will suffice; and thus the same rick will afford litter and shelter as well as food for the cattle, all of which are matters of economy worthy of attention. Doubtless other roots might be stored in a similar manner, particularly Carrots and Swedish Turnips.—*H.*

FARMERS' CLUBS.

Inverness.—At the late October meeting of this Society, an interesting discussion ensued on the question appointed for the evening—namely, What are the best Modes of applying Guano as a Manure to the different kinds of Crops reared in the County of Inverness? The experience of our farmers on this subject has not in general exceeded that of two years, but it has been quite satisfactory and encouraging so far as it has gone. Mr. Sutherland defended the old muck and farm-yard manure system, as opposed to the introduction of foreign composts and manures; but this afforded an opportunity to several gentlemen to show that guano is not meant to supersede the old mode of dunging, but to supplement it where a sufficiency of farm-yard manure is not to be had, or where it cannot be easily carried; and that guano can be obtained and applied as a supplement to the dung-heap at one-third of the expense of the home-made article. Dr. Nicol stated, that but for guano he would have had no crop at all on his light soil this season; Mr. Brown, Linkwood, said its superior energy was visible in every place where it had been tried, all over the country; and several other gentlemen confirmed the fact that those effects are not merely temporary for one season, but continued for several years—dependent, however, on the scourging nature of the crops grown after it has been laid down, and on the greater or less quantity of its elements which they may severally consume. Dr. Nicol stated, that although he had only been enabled to apply guano pratically for the last two years, he had been familiar with the substance, and alive to its value as an object of agricultural importance, for twenty-five years. He had, in a small agricultural laboratory, prepared composts during this period in imitation of guano, and applied them in the same manner in which guano was now applied. He had a peculiar and light soil to manage. While the attention of the country had been directed to the best means of draining, he was compelled to direct his attention to the best means of retaining moisture, and he had tried nothing with greater satisfaction than guano. He had screened or sifted it, and then attempted to crush the residuum, but this gave a great proportion of refuse. Determined

to ascertain the best mode of its equal distribution over the soil, he next caused it to be mixed with water to the consistence of cream. This he had passed through a fine riddle; a fresh quantity of water was mixed with the refuse, and in this manner the whole of the guano was separated from the bones, feathers, skins, and grit. A given weight of the guano thus prepared was mixed with a given number of bushels of dry mould or wood ashes, or both mixed together, and when the mass was made up, it was just dry enough to pass through a screen or iron riddle, and to admit of being sown immediately before or after the prepared soil. In mixing up the guano with water, he used a few pounds of powdered gypsum as a fixer, according to the common phrase, and he urged the importance of such an admixture, whether the guano was applied as he used it, or in its original state. He was satisfied that, when he considered the influence of the long-continued dry weather during the early part of the season, he would have had little or no crop on his dry soil, but for the invigorating and powerful influence of the guano, and he had this year a better green and corn crop than he had ever had before.—Mr. Fraser, of Reelig, briefly stated that he had been in the habit of applying three cwt. of guano per acre, sowed with the crop, and had found it succeed admirably. In his opinion and experience the best way for Turnips was to sow the guano broadcast (after the land is clean and in order for drilling)—then harrow well in, and drill up—the whole guano will be then in the raised drills, but intimately mixed with the soil, so as to furnish food in the best manner to the young plant, without burning the seed. As to white crops, he thought that either the whole or part of what is given per acre should be sown broadcast, and harrowed in, then the seed sown and harrowed in, so that the whole should be mixed as before with the soil. When a part is reserved it should be sown in spring, when the plant (Wheat) begins to look sickly, when the guano will start it afresh. A friend from London says, that it has been recommended, when sowing guano with white crops, to add from ¼ to ½ cwt. of nitrate of soda, which brings away the plant finely.

Witham.—At the late meeting of this Agricultural Society the President read an account of the following experiment with manure:—Much has been said respecting the management of farm-yard manure, some contending that rain or water injures the quality of such manure, and renders it worthless. Others believe that such manure cannot be made without a considerable portion of water, as dry muck will mould, and lose all its fertilising qualities. The following experiment was made this last summer, 1844:—On the 15th of November, 1843, 10 Scots were put loose in stalls 12 feet square, fed with Bean meal, cut hay, malt coombs, and oil-cake. Each bullock foddered or littered with one truss of good wheat straw per day, 36 lb. per truss, carefully weighed; cleaned out once a month; no urine escaped, all was absorbed by the daily large quantity of straw foddered. On the 13th of January, 1844, five stalls were cleaned out, and the manure weighed the same day, carefully laid by itself, and covered nine inches thick with earth—no evaporation escaped; stirred over three times and watered each time, as the manure was disposed to mould very much. On the 4th of April weighed again, and carted upon the land for Oats; not very rotten; the carts were filled exactly 3 tons weight, and laid upon one quarter of an acre. On the same day, 13th of January, the other five stalls were cleaned out, and laid upon dry ground, all exposed to the weather, from the 13th of January to the 4th of April, weighed and managed exactly as the other five stalls, stirred on the same days, watered when stirred; what drained from it was thrown upon the heap of manure. Exactly 3 tons laid upon the same quantity of land. The whole threshed directly out of the field, 24th August. One quarter of an acre of Oats produced, from the manure closely covered up, 18 bushels 1 peck; weighed 38 lbs. per bushel. Straw 5 cwt. 1 qr. 18 lbs. One quarter of an acre, not covered up, produced 17 bushels 1 peck; weighed 38 lbs. per bushel. Straw 5 cwt. 1 qr. 6 lbs. In tabular form they will stand thus:—

	qrs.	bsh.
Covered manure, produce	9	1
Not covered	8	5
In favour of covered manure	0	4

	cwt.	qrs.	lbs.
Produce of straw, per acre, covered	21	3	10
Ditto not covered	21	1	10
In favour of covered manure	0	2	0

On the same day, one quarter of an acre was manured with 1 cwt. of guano, and produced 19 bushels 37½ lbs. per bushel. Straw, 24 cwt. 7 lbs. Oats, guano-manured, equal to 9 qrs. 4 bush. per acre: straw 24 cwt. 2 qrs. per acre. The guano-manured exceeded 3 bush. of Oats per acre more than the covered muck.—N.B. Guano was sown on Wheat, Barley, Oats, and Carraway, upon another farm, a different soil, subsoil clay; no benefit was observed. The drought continued a long time.

The following paper was then read:—*Sowing Wheat.*—August, 1843, one quarter of an acre of a very gravelly soil—in a hot summer producing but little—was, after Peas, ploughed four times in the same day with six horses, 15 inches deep; dibbled with Wheat in October, and produced at the rate of 5 bushels 3 pecks per acre more than the land by the side of it, ploughed in the usual way for Wheat 5 inches deep. Straw 3¼ cwt. per acre more than the adjoining land of the same measure and same soil. This same field is subject to Wire-grass in the autumn; in a few weeks it is thickly coated. One acre was hoed and burnt, costing 10*s.* per acre. One acre by the side of it ploughed with a wheel coulter. All dibbled; no visible difference throughout the year either in produce or in cleanliness of the land during the summer or this autumn, 1844. One acre in the same field was folded 14 nights with 200 sheep, fed in the day-time on stubbles—no oil-cake or Corn. The other part of the field all manured: 10 tons of good muck per acre. The folded Wheat exceeded the manured Wheat 2 bushels 3 pecks per acre, and the straw 3¾ cwt. per acre. The folded Wheat 1 lb. 4 oz. per bushel the lightest.

Experiment upon Horse-keeping.—June 24, 1844.—Two cart-horses in good condition were kept loose in the stable, seven days, without going out of it, kept upon green Tares and Corn. Consumed in the seven days 12 cwt. 1 qr. 6 lb. of excellent green Tares, then at the top of their growth, before they had bloomed: dry weather: no waste.

	cwt.	qrs.	lbs.
Also one peck of Oats per day per horse, 3 bushels 2 pecks weighed	1	1	7
Also chaff	0	2	4
Corn and chaff	1	3	11
Tares	12	1	8
Two horses consumed in one week	14	0	19
One horse consumed in weight in 7 days	7	0	9

That is, 113 lbs. per day for one horse. Drank 6 gallons of water per horse per day. Two horses littered for 7 days, one truss of Wheat straw per day, 36 lbs. per truss.

	cwt.	qrs.	lbs.
From 252 lbs. of straw and the above food and water.—Weight of manure in its raw state at the end of the week	12	2	3
Monday, 5th of August.—Weighed the muck made from the green Tares after lying in a dry stable six weeks, stirred over four times, four pails of water (that is, 16 gallons) thrown upon it, as the dry muck required it every time to prevent its moulding. It was not very rotten; it was removed with a fork, no shovel used: weighed this day	5	1	10

N.B.—The stable was a sound old brick floor, with a gutter in it; a 10-gallon copper was placed at the fall of the gutter, and cemented carefully. No urine could escape. Only 21 quarts of urine in the seven days drained into the reservoir. *Second Experiment on Horse-keeping—with dry food.*—Monday, the 7th July, 1841.—Two cart-horses (not the same as before mentioned, but of the same size and condition) were kept in the same stable upon dry food, and not removed for seven days.

	cwt.	qrs.	lbs.
3 cwt. of excellent Clover hay consumed in the 7 days	3	0	7
1 peck of Oats per day per horse	1	1	0
Also chaff	0	2	4
Two horses consumed in one week	4	3	11
One horse consumed in weight in 7 days	2	1	19

That is, 39 lbs. per day for one horse upon dry food. Drank 12 gallons of water per day per horse.

	cwt.	qrs.	lbs.
Weight of manure in its raw state, from 252 lbs of straw, and food and water	10	1	2
The same, after being kept in the stable 6 weeks, stirred over 4 times, 4 pails of water each time (great difficulty in preventing its getting mouldy): it weighed	6	0	2
Decrease in weight	4	1	0

Only 13 quarts of urine drained from the dry food.

	cwt.	qrs.	lbs.
Observe, manure made from green food, when in a proper state to be carted upon the land	5	1	10
Difference in weight in favour of green food	1	0	10

Notwithstanding this increase of weight in the green food, it is presumed the manure made from the dry food is of the most value.

The President then said, Mr. W. Hutley had put into his hands the following paper relative to experiments with Wheat drilled on the same description of land:—

Account of the Produce from different quantities of Wheat, drilled upon equal quantities of land.

No. 1. Drilled at the rate of 4 pecks per acre, rows 12 inches apart.

	qrs.	b.	pk.	pt.
Produce—Wheat, best	3	3	1	2
Seconds and tail	0	1	1	5
Total	3	4	2	7

Straw 12 cwt. 13 lb.

No. 2. Drilled at the rate of 6 pecks per acre, rows 6 inches apart.

Wheat, best	3	5	3	0
Seconds and tail	0	1	1	2½
Total	3	7	0	2½

Straw 15 cwt. 15 lb.

No. 3. Drilled at the rate of 9 pecks per acre, rows 6 inches apart.

Wheat, best	3	6	1	5
Seconds and tail	0	1	3	3
Total	4	0	0	8

Straw 15 cwt. 3 qr. 21 lb.

N.B.—No. 1 was about a week later in ripening than the other two pieces.

The President said, Professor Johnston told him that the other day he was in Hampshire, and there he found thin sowing answered very well.—Mr. H. Dixon said, Mr. R. Dixon had tested Lord Western's recommendation of 9-inch drilling against his own, which was six inches. He sowed at least two bushels and a half an acre, generally three; and there were 71 acres of land which in 12 years had grown 272 acres of Wheat, the average of the crops for those 12 years being pretty well 5½ qrs. per acre. This was from thick sowing. He was also a thick sower of Beans; he put on six or seven bushels of beans per acre: his average for the last 12 years was eight quarters (!) of Beans per acre.—The President asked if Mr. Wm. Hutley could give them an idea of the expense of burning and draining his land. The land was forked after the plough, and he saw there were 20 men to two ploughs, which must have been a considerable expense.—Mr. Hutley said, when he took his farm he thought no farm was more out of condition; it was extremely poor, and was overrun with Thistles, Docks, and everything that a man who pretended to good farming ought to try to eradicate. The first thing he set about was to take the water off it, which had cost him rather more than 200*l.* on 160 acres, as he had made rather more than a mile of drainage through it. At the time he took the land there were a vast number of Pollard-trees on it, and being fully convinced these were an injury to the farmer, and an impediment to good cultivation, he cut them down and drew them home. He then set about the tillage of the land with spirit. He forked 25 acres of it, ploughing five inches and forking ten, and keeping the subsoil at the top; that cost him 10*s.* an acre to plough, because the horses going upon the soft soil could not get over so much land; and the forking cost him 43*s.* 4*d.* an acre. He had 13 acres of the land so bad, and so soft in some places, that the cattle could hardly go upon it. After he had drained it, it cost 5*l.* or 6*l.* an acre to plough; then 46*s.* for burning; and he had now got as good a crop of Turnips on it as at any other part. The whole expense of bringing the land into this state was from 12*l.* to 15*l.* an acre; and with the year's rent for the 160 acres, it had cost him, without anything for stock, except horses, 2600*l.* He thought it was the duty of the landlord to take a tenant that was competent to employ labour and improve the soil. The next thing was to give them a lease and stimulate them to lay out their money. He had seen a vast deal of mismanagement and a good deal of good management, but he never saw a man that could farm that had not got a lease, for he never saw him disposed to try. He would say to the landlords, "You cannot grow timber and corn too." They had a discussion on this subject at the Farmers' Club twelve months ago, and the conclusion they came to was that they should endeavour to get rid of the timber by offering the landlord 2*s.* an acre extra rent; he was sure it would be worth it; and he was sure if the landlord laid out that money in land, in the course of ten years it would produce more than all his timber was worth. Let them grow their timber where it ought to be grown—in woods. Looking around that neighbourhood they would find invariably that when individuals were without leases, and had timber on the estates, they had little in their pockets and nothing in their cupboards.—Mr. J. Beadel, in the course of his remarks on the state of Agriculture in Ireland, said, the system of cropping as he observed it would rather surprise them—they began with Potatoes; then they took Wheat; after Wheat they took four or five successions of Oats; and then they laid the land down to "rest," as they called it, but during the time land was thus at rest, he had seen upon it weeds, Docks, &c., taller and bigger round than he was himself. He walked over one field of this sort with the farmer, and he said to him, "What do you call this?" "Oh," said he, "that is at rest." "Rest! we should not call it rest in England, for we consider it draws the land as much to grow weeds as to grow corn."—This, it would appear, is an exaggerated picture of the most cultivated districts in Ireland.

Darlington.—The Members of this Club held their Monthly Meeting on Monday last, at the Offices of Mr. Thos. Dixon, Land Agent, their Secretary; the subject under discussion being The best Method of preserving Turnips through the Winter, and whether it is desirable to draw them from the Land, both as regards the preservation of the Turnips and keeping the Land in condition. The chairman introduced the subject, and during the course of the discussion he read an able communication on the subject from the pen of Mr. Davidson, a well-known correspondent of the Club. The members present were unanimous in opinion that in every case where Turnips are stored either in houses, in camps, or otherwise, in considerable quantities, it is desirable to pay attention to the manner in which the Turnips are prepared for storing. The top and roots ought to be taken off, together with as much dirt as possible, in order that the Turnips be stored clean; at the same time being careful in cutting off the tops and tails not to injure or wound the bulb or Turnip, as by that means, if wounded, its juices are exhausted and it is more liable to decay. With regard to storing or preserving the Globe or common White Turnip, it was only considered expedient so far as to have a regular supply always on hand, to serve the cattle in case of severe frost or wet weather, and on that account it becomes necessary to have three or four weeks' provision laid up beforehand, else it is generally found that White Turnips answer best and feed to most advantage when fresh drawn from the land; besides, when stored they do not generally keep well for any length of time, and in no case should they be stored later than the middle of December. With regard to Swedes and other hardy and late winter Turnips, the members were of opinion that it was in numerous cases advantageous to draw them from the land and store them, both as regards preserving the Turnips and keeping the land in condition and free from exhaustion. Swedish Turnips are of a hardy nature, and when healthy stand the winter frost well; but in very early spring, when vegetation takes place, both the Turnip and the land begin immediately to suffer, the bulb of the Turnip begins to turn into

woody fibre, and the roots begin to draw upon and exhaust the land without benefiting the Turnip; therefore, under these circumstances, it was considered desirable to take advantage of a fine dry season, not later than the commencement of February, and draw from the land and store, as far as practicable, all the later and hurtful kind of Turnips for spring use. Where parties have not the advantage of sufficient Turnip houses and sheds for storing their Turnips, it was considered a good plan to pile them up between rows of hurdles placed about four or five feet apart, and lined with straw, the Turnips then piled to the height of four or five feet, and then thatched or covered over with straw; in this way they keep pretty well. Upon wet land, where they may not be convenient in all cases to have the spring Turnips drawn from the land previous to vegetation taking place, a cheap method of putting a partial stop to vegetation was named by one of the members, which was as follows:—Go over the rows and pull all the Turnips nearly up by the roots, and then leave them in their proper position; by this means vegetation is delayed, and yet the Turnip keeps pretty fresh. Another point of very considerable importance was also touched upon, viz., the eating Turnips on the land; it was considered that too much care could not be taken to have this done when the land was in a proper state, as in many instances, where the Turnips are eaten off whilst the land is in a very wet state, there is no calculating the injury done to the land. The subject fixed for discussion at the November meeting is, The proper Time for Preparing and preparing Land for Beans and other Crops.

Wrexham.—At the last monthly meeting, the subject before the Club was The most eligible System of working Horses on a Farm, whether by yearly In-door Servants, or by Week-men. The peculiar province of a team-man was allowed to be one of much importance on a farm, and the present discussion was therefore not solely on the working of horses, but on the qualifications indispensable for such a post. On the score of economy the difference between hired servants and week-men was believed to be inconsiderable, although slightly in favour of the former. The question was therefore considered more as one of expediency, which could only be determined by reference to peculiarity of situation, or other local circumstances. Frequent changes being at all times undesirable, the advocates for week-men as horse-drivers were of opinion that when married men living contiguously were employed in that capacity, their services were likely to be more permanent, and consequently the interest in promoting their employers' welfare, being that of securing their own continuance, was greater. Yearly servants, on the contrary, were not usually to be depended upon beyond the expiration of their period of service; and as team-men generally obtain an increased rate of wages, it is desirable on the head that the preference should be given to married men. On the other hand, it was believed that horses received better treatment when attended to by hired servants and single men, and it was also considered questionable whether the practice of entirely employing week-men, and particularly married men for this purpose, did not induce earlier or imprudent marriages, under the idea of obtaining better places, thus operating not unfrequently to the injury of a parish. In remote situations, in-door servants are decidedly to be preferred as a matter of convenience. It was also urged that the system of keeping hired servants tended materially in the end to their becoming better workmen generally, and more practically acquainted with the different husbandry operations on a farm. As no rule could, however, be laid down applicable in all cases, the following resolution was subsequently adopted:—"That where a surplus of labourers exist, and cottages are conveniently situated, the advantage appears in favour of employing week-men for the purpose of working horses on a farm, but under other circumstances yearly servants are to be preferred; although a mixture of both appears in some measure desirable, as tending to the better instruction of young servants, and to their ultimately becoming more generally useful labourers."

Miscellaneous.

On Fattening Stock in Winter.—The subject proposed for February was, "On the best manner of fattening Beasts and Sheep in the Winter Season. *Resolution.*—It is the opinion of the Members present, that the best method of fattening bullocks in the winter season is by giving them that description of root first, which will deteriorate most by keeping; consequently common Turnips should be given first, then Swedes, and Beet-root last; in all cases, the root to be cut into troughs, care being taken that they have the food regularly, and not too much by them at a time. With the above food it is desirable to give good hay, with oil-cake and Pea or Bean meal mixed together with a sufficient quantity of cut hay, in order that the corn may be consumed without waste. The proportion of corn and cake given must depend on the size of the bullocks, the quantity of root in hand, and the time most desirable to get them to market. Bullocks tied up in a shed are considered to consume less food and to fat quicker than if allowed to range over a yard. Boiled linseed is also strongly recommended. In fattening sheep on roots, it is advisable to cut the same into troughs, and consume the food where it grows on mixed soil and light lands; by this method they may be confined in a fold, and made to go over the land in a regular manner and deposit the tathe equally. Hay of good quality should be given sheep at all times during the winter season; and where quick fattening is required it is the opinion of this Meeting, that a pint of Peas or Oats each per day should be given mixed with cut chaff. The members present not having been in the habit of giving sheep oil-cake or linseed, do not feel confident to decide if either would be more advantageous than corn.—*Fifth Report of the Watford Farmers' Club.*

Adulteration of Guano.—Four vessels recently sailed hence for guano stations ballasted with gypsum, or plaster of Paris. This substance is intended for admixture with guano, and will enable the parties to deliver from the vessel a fine-looking, light-coloured article. Parties purchasing guano are very desirous of having it delivered from the vessel, as they believe they obtain it pure. The favourite material for the adulteration of guano, at the present moment, is umber, which is brought from Anglesea in large quantities. The rate of admixture, we are informed, is about 15 cwt. of umber to about 5 cwt. of Peruvian guano, from which an excellent-looking article, called African guano, is manufactured.—*Liverpool Paper.*

Guano.—We understand, by warrant from the Right Hon. the Lords Commissioners of Her Majesty's Treasury, dated the 17th ult., that guano imported from Ichaboe, or other places on the west coast of Africa, in British ships, and sold for the first time, is directed to be passed free of the auction duty of one-half per cent., hitherto charged on the sale of that article.—*Liverpool Courier.*

Notices to Correspondents.

ANALYSIS OF GUANO.—*Dr. Newington.*—See Paper by Dr. Ure in the last number of the Royal Agricultural Society's Journal.

BONE-DUST.—*Ullswater.*—It is not necessary that it should be literally dust, but it should be finer than half inch material: that which is coarser, if spread on your Grass land, will act slowly, but for a long time.

CARCASES.—*Esser.*—See answer to a similar question in last Gazette. The flesh should be chopped up, and mixed and covered with vegetable earth, and the bones should be sold at the bone-mill where you buy your bone dust.

CLAY BURNING.—*To Reader.*—Can any one describe the process of burning clay for ballast, as conducted on the Great Western Railway?

DEPTH OF SOWING.—*W. C.*—We do not know Smith's hand-dibble. Wheat, Oats, and Barley, should be sown 1½ to 3 inches deep. With reference to the Grasses, see an Article by Mr. Stirling, published in this Paper not long ago. Mangold Wurzel seed should be dibbled not more than half an inch deep in rows 2 feet or more apart, and at intervals of 12 inches in the rows.

FIVE PAGES.—*Cubitonian.*—Thank you. The letter by Mr. Grant has already appeared in our columns.

GAS WATER, &c.—*W. B. G.*—It has been applied with useful result at the rate of 400 gallons per acre; but it must be remembered that it varies much in quality. Gas lime may be applied at the rate of 2 or 3 cart-loads per acre. It should be made into a compost with any vegetable refuse, and must be turned frequently before being spread. When thus exposed to the air it gradually becomes converted into gypsum. You cannot do better with sulphate liquid manure than saturate mould with it, and then carry it to the field.

LIQUID MANURE.—*A Mid-Lothian Farmer* recommends to the attention of agricultural chemists the preparation of a soluble compound manure which, by the addition of water, might be converted into a liquid top dressing for Grass lands. The sulphate of iron (green vitriol), is, perhaps, the cheapest fixer of ammonia we have.

MR. WARNES' SYSTEM OF FEEDING.—*A. O.*—It is adapted for dairy cows.

SALT.—*Somerset.*—If you are inland, apply it to Grass land in wet weather in April, and to young Oats about the same time, at the rate of 1 cwt. per acre.

SAW-DUST.—*W. P. P.*—There are three ways of using it:—you may soak it with liquid manure, and if you turn it frequently, it will probably, partially rot, and may then be applied to the land: or you may burn it and use the ashes: or you may apply it direct to the land, and perhaps this, on clay land, may be a useful manure. Of the last, however, we cannot speak from experience.

SEA BUCKTHORN.—*N. S. H.*—Thanks. Your communication has been anticipated.

SILENT BARK, &c.—*Subscriber.*—We have applied it with benefit, first soaked with liquid manure, at the rate of about 10 cubic yards per acre. The compost of bark, soot, &c., which you propose, will in all probability be beneficial. Gypsum as it is sold, is just the mineral as it occurs in nature, reduced to a powder.

SWIFT'S WORKS.—*J. F. W.* will have found in last Paper that he was anticipated.

WARNES' PUDDING.—*A. Z.*—You must manufacture it at home. See Paper on "Flax-seed as Food," in the last Number of the Gazette.

WHEAT.—*A. H.*—The young plant is folded over generally in April. On loose soils it is said to be benencial. The quantity of land for a given number of sheep of course varies with the luxuriance of the Wheat plant. We shall, probably, have a word or two to say on this subject before spring.

YEARLING SHEEP.—*Constant Reader.*—They will fat readily enough on Linseed and hay. They will need water.

MISCELLANEOUS.—*J. D.*—There are practical difficulties in the way, but we will consider the subject.

Markets.

POTATOES.—SOUTHWARK WATERSIDE, NOV. 11.

THE prevailing east winds have prevented arrivals from the northern districts, but there have been several arrivals from the Channel Islands and Devonshire, yet the demand for the small stock of Reds was not so good as was anticipated, and although 60s. was asked for the best Scotch, that price may be considered nominal.

MARK-LANE, MONDAY, NOV. 11.

THERE was a larger supply of Wheat from Essex, Kent, and Suffolk, than we have received for several weeks, and the trade was materially deteriorated by the damp weather, which rendered it rather difficult of sale at a decline of 2s. per quarter on Thursday, as well as inferior qualities. Foreign was in fair demand, at the high prices at which it was held. Grinding Barley sold on about the same terms. Fine malting and inferior qualities were 1s. lower. Peas, White and Boilers are 1s. higher. Beans have advanced 1s. to 2s. per quarter. There is more doing in Oats at 6d. to 1s. advance.

FRIDAY, NOV. 17.

THE arrivals of Corn and Flour during the week have been small, and the business transacted both on Wednesday and Thursday was to a limited extent only. In Wheat, both English and Foreign, we observe no alteration. The very few good qualities of Barley maintain our quotations, but all other descriptions meet a slow heavy sale. Beans, Peas, and Oats continue heavy at decline, the Market being badly supplied with either articles.

KINGSFORD AND LAY.

COVENT GARDEN, NOV. 16.—The supply of fruits and vegetables throughout the week has been good; but in consequence of the late heavy rains, trade has been somewhat dull. The prices of Pines and Grapes remain unaltered. A few Spanish Melons are offered, and occasionally one or two of English growth are to be seen. Dessert Pears are good and plentiful, the best being Marie Louise, Crassane, Glout Morceau, Passe Colmar, and Beurré Diel. Apples [illegible], of good quality, are also plentiful, and have not varied in price since our last Report. Oranges are beginning to make their appearance, and the supply of other foreign fruit is good. Of Plums some of the late Imperatrice may still be met with, and Damsons, although very scarce, are still offered. A few Berberries are left, which are selling at 2s. per half-sieve. Walnuts bring from 12s. to 20s. per bushel; other Nuts are tolerably abundant. Vegetables are for the most part sufficient for the demand. Broccoli, however, is not quite so plentiful as it was last week. Cauliflowers are well supplied, and Cabbages, Savoys, and Brussels Sprouts are abundant. Celery of excellent quality is offered at about 2s. per bunch. A considerable quantity of foreign Horse-radish is in the market, and we also observed some fine American Shallots. Mushrooms have not altered in price since last week. Endive and other Salacing is sufficient for the demand. Among Cut Flowers we noticed Cypripedium insigne, and C. venustum, Azalea indica alba, Cyclamen persicum, Bignonia venusta, Amaryllises, Chrysanthemums, Roses, Gardenias, Auriculas, and Neapolitan Violets.

SMITHFIELD, MONDAY, NOV. 11.—Per stone of 8lbs.

Best Scots, Herefords, &c.	3s 10 to 4s	3 10	Best Downs & Half-breds	3s 10 to 4s	3	10
Best Short Horns	3 8	3 10	Best Long-woods	3 6	3	8
Second quality Beasts	2 8	3 2	Ewes and second quality	3 2	3	6
Calves	3 8	4 2	Pigs	3 6	4	0

Beasts, 3,061; Sheep, 26,120; Calves, 97; Pigs, 440.

Our supply of Beasts being considerably [illegible] demand, especially for the best qualities. Several of the best Scots, &c. realised 4s. 2d., and Short Horns 4s., although we cannot, as a general quote higher than this day week. Middling qualities sell heavily money, but we have been enabled to get clearer of them to-day. time about the same in quantity as of late; foll[illegible] Prices are about the same as last Monday; the best old Downs are perhaps a shade more money. Veal is not plentiful, and trade for good Calves; yet 4s 4d is scarcely obtained for [illegible] heavy.

FRIDAY, NOV. 15.

We have [illegible] many Beasts for the trade, and 4s is with difficulty obtained for the best Scots, &c., and 4s for Short Horns; but heavy on hand from 2s 6d to 3s 6d per stone. Prime sheep are short, and the trade somewhat brisker than last Friday; but coverings in prevalent on Monday's quotations. Downs & Best Long-woods 4s 1d to 4s 4d. Ewes are a heavy trade at 3s 6d. Veal-trade is excessively heavy, and 4s is considered an for the best qualities. Pork-trade is very heavy, and it must quality to make 4s per 8lbs.

Beasts, 720; Sheep, 3,410; Calves, 180; Pigs, 260.

41, West Sm[illegible]

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Nov. 16, 1844.

DR. HALLETT'S DRY SOLUBLE FERTILIZER'S are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried thirty (see No. 48 of the *Gardeners' Chronicle*, &c.). 5 cwt. of either has been found equal to nearly 30 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10*l.* per ton, or 12*s.* per cwt.

DR. HALLETT'S CONCENTRATED LIQUID FERTILIZER is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1*s.* 6*d.*, and in bottles, six times the size, at 7*s.* 6*d.* Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Warner & Warner, 28, Cornhill; Horsf. & M'Mullen, 6, Leadenhall-street; Winstanley, Poultry; Pace & Co., St. Peter's Alley, Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mettam & Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seccard, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. D. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace & Co. Dundee—Green and Co. Further respectable Agents wanted.

GYPSUM.—Farmers are advised by Chemists to use none but the Calcined Gypsum, the effects of which as a Manure are astonishing. Pure Calcined Gypsum of a peculiarly strong quality, may be had of H. OLIVER, 83, Hatton Garden, London, at a lower price than dealers are charging for inferior Uncalcined Gypsum. Plaster of Paris for Builders equally low.—N.B. A Treatise and Samples sent post free on application.

DRAINING OF LAND.—THE WORKMAN'S LEVEL, invented by Mr. BAILEY DENTON, is made and sold, as approved by him, by MESSRS. JONES, Opticians, 30, Lower Holborn, London, price 30*s.*

IMPROVED ROOFING FELT.

McKIBBIN'S PATENT ROOFING FELT is particularly applicable as a Substitute for Slate, Zinc, Tiles, Thatch, and other Articles used for Roofing, from its Economy, Durability, and Lightness. It is quite impervious to wet and damp, resists the heat of the sun, and is a non-conductor of heat or cold. Besides the economy in repairs, the timber where it is used may be so light as to save its whole expense. It requires no other coping, and by attention to printed directions may be applied by a common labourer. It is free from breakage and contraction, like zinc, and requires neither painting nor coating. It is now in very general use for Roofing Houses, Verandahs, Sheds, Workshops, Ropewalks, Railway Stations, Icehouses, &c. &c., and for protecting Plants, covering Garden Frames, Corn, and Hay Ricks, the top and sides of Sheep-folds; and to Emigrants it provides a cheap, warm, durable, and portable Roof.

This Improved Roofing Felt is much more durable than the common Felt, made in lengths, not being subject, like it or other materials in continuous lengths, to be stripped by storm; and being fastened down at the overlaps only, the wet cannot percolate through the nail-holes.

Sold in sheets 32 inches by 20, at 5*d.* each (being less than 9*s.* 6*d.* per square of 100 feet).—Apply to H. C. BOWDEN, Agent to the Manufacturers, East India Chambers, Leadenhall-street, London.

RAMS FOR RAISING WATER WITHOUT LABOUR, where a fall can be obtained. FOUNTAIN BASINS IN IRON, &c.
70, STRAND, LONDON.

F. ROE having purchased all the Patterns of Basins, Jets, &c. formerly belonging to W. Rowley, Fountain Maker to the Royal Family, is enabled to offer the above article in iron, which will stand the Frost and last for ages. A Ram and Fountain Jets fixed on the premises for inspection. Every kind of Garden and other Pumps, Well Engines, Baths, &c. Houses, &c. Heated by Hot Water.

TO COLONISTS, EMIGRANTS, &c.—Mrs. MARY WEDLAKE, widow of the late THOMAS WEDLAKE, at 118, FENCHURCH-STREET, CITY, informs Emigrants and others that she continues to manufacture those Agricultural Implements for which her late husband was so extensively patronised by the Settlers of South Australia, Van Diemen's Land, Swan River, New Zealand, and other British Colonies. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, viz.:—

Patent Hay-making Machines	Flour-Mills—Bean-Mills
Dressing Machines	Patent Essex Ploughs, 30 sorts
Patent Chaff-cutting Machines	Subsoil Ploughs [Colonies
Oil cake Crushers	Threshing Machines for the
Double action Turnip cutters	Drills of all kinds—Scarifiers
Railway Wheels	Vacuum Pumps.

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch-street, London.

H. WALKER'S NEEDLES (by Authority the "Queen's Own") have large eyes, easily threaded, (even by blind persons), and improved points, temper, and finish. Each paper is labelled with a likeness of Her Majesty or His Royal Highness Prince Albert, in relief, on coloured grounds. Every quality of Needles, Fish-hooks, Hooks-and-eyes, Steel Pens, &c., for shipping. These Needles or Pens for the home trade are sent free, by post, by any respectable dealer, on receipt of thirteen penny stamps for every shilling value.

H. WALKER, manufacturer to the Queen, No. 1 (late 20), Maiden-lane, Wood-street, London.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. **Prepared from the Recipe of a Nobleman in the County.**

"*Great Western Steam-ship, June 6*, 1844.—**The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers, for its capital flavour, and as the best accompaniment of its kind for a voyage.** (Signed) JAMES HOSKEN."

"**One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup; giving a zest far superior to the long-established favourites; more wholesome and of less cost.**"—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; **and Retail by the usual venders of Sauces.**

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING, **Saving half the Timber** usually consumed.
Weight, 24 lbs. per square of 100 feet.
Cost, 8*s.* 4*d.* per square of 100 feet.
The above Material has been used and approved of by the NOBILITY, GENTRY, and AGRICULTURISTS generally, as a ROOFING & COVERING to SIDES of FARM BUILDINGS.
Its advantages are LIGHTNESS, DURABILITY & ECONOMY.
Being a non-conductor, it has been proved an efficient PROTECTIVE MATERIAL TO PLANTS, and is now in use at the ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK.
It can be had of any length, 32 inches wide, at 1*d* per foot, super. A discount to the Trade.
THOMAS J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

WHITNEY'S PATENT CLOTH for COVERING GREEN HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 16½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon Street; and Hannay & Co., Oxford Street.—Wholesale and Shipping Agent, Mr. Bailey, Wolverhampton

FIDDLE and PRINCE ALBERT'S PATTERN PLATE.—A. B. SAVORY and SONS, Manufacturing Silversmiths, No. 14, Cornhill, opposite the Bank of England.—The best wrought SILVER SPOONS and FORKS, fiddle-pattern, 7*s.* 2*d.* per ounce; the Prince Albert's pattern, 7*s.* 6*d.* per ounce. The articles may be had, lighter or heavier, at the same price per ounce:—

The Fiddle	oz.	*s.*	*d.*	£	*s.*	*d.*	Prince Albert's	oz.	*s.*	*d.*	£	*s.*	*d.*
12 Tbl. Spoons	30	at 7	2	10	15	0	12 Tbl. Spoons	40	at 7	6	15	0	0

Messrs. SAVORY and SONS recommend the Prince Albert's Pattern; it is very novel, and of unexampled beauty.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. **This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their Establishments, 22, Regent-street (corner of Jermyn-street), or 45, Moorgate-street, City. New goods** Plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the kingdom and abroad free.

STOOPING of the SHOULDERS and CONTRACTION of the CHEST are entirely prevented, and gently and effectually removed in Youth, and Ladies and Gentlemen, by the occasional use of the PATENT ST. JAMES'S CHEST EXPANDER, which is light, simple, easily employed outwardly or invisibly, without bands beneath the arms, uncomfortable constraint, or impediment to exercise. Sent per post, by Mr. A. BINYON, 40, Tavistock St., Strand, London, or full particulars on receiving a postage stamp.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON and Co., West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co." under a crown. Old articles replated and gilt.

THE LIBRARY OF TRAVEL.—VOLUME THE FIRST.

Just published, with 180 Woodcut Illustrations, price 8s. 6d. in cloth.

SYRIA and the HOLY LAND, their Scenery and their People, Incidents of Travel, &c., from the best and most recent authorities. By WALTER K. KELLY.

"Never was information more amusingly conveyed—never were the results of voluminous works of travel more spiritedly condensed than in this work. The execution is truly admirable. It reads like an original work instead of a compilation. The moral, social, physical, political, and geographical features of the East are well brought out, and the reader is at home with the Turk, the Arab, the Jew, the Druse, and the Maronite."—*Westminster Review.*

CHAPMAN and HALL, 186, Strand.

In one volume, cloth, price 5s. 6d.,

CHESS for BEGINNERS; in a Series of Progressive Lessons: showing the most approved Methods of Beginning and Ending the Game, together with various Situations and Checkmates. By WILLIAM LEWIS. Second Edition. With 24 Diagrams printed in colours.

Order The Athenæum of any Bookseller or Newsman.

JOHNSON'S GARDENERS' ALMANACK for 1845, price 1s., Illustrated with Woodcuts, will be published on NOVEMBER 21.

This Work commenced with the year 1844, and was so eagerly received by the public that it speedily attained the Eighth Edition. The plan of the Work, therefore, may be presumed to be generally known and approved of; and every effort has been made to render the forthcoming Number richer, if possible, than that of the preceding year. As it is intended to form a permanent and indexed record of matters interesting to the Landed Gentry and Cultivators of Gardens generally, a Ninth Edition has been printed expressly for the purpose of supplying those persons who, commencing with 1845, may afterwards feel desirous of having the Work complete.

London: Printed for the Company of Stationers; and sold by G. GREENHILL, at their Hall, Ludgate-street.

SUBSCRIPTIONS

FOR THE

NATIONAL TESTIMONIAL

TO

MR. ROWLAND HILL,

AUTHOR OF THE PENNY POSTAGE,

WILL CLOSE ON THE 30TH OF NOVEMBER.

OF all the sources of income stated in the recently published Quarterly Returns of the Public Revenue, none exhibit *so large* a proportionate increase as the *Post Office*. On the year's net Revenue, the Customs have increased at the rate of about 1*0* per cent., the Excise 1½ per cent., the Property Tax 2 per cent., while the *Post Office Revenue*, under its almost nominal rate of a penny, has increased above 13½ per cent., and the increase on the quarter has been even as much as 25 per cent.

These cheering results show that (though the *plan of Penny Postage* is yet but *imperfectly tried*) the *complete restoration* of the Post Office Revenue to its amount before the Penny Postage was adopted is not an event far distant, if it be fully and honestly carried out; and the *City of London Mercantile Committee on Postage* desire to impress these satisfactory results most emphatically upon the Public, in announcing the *approaching close* of the National Testimonial to Mr. Rowland Hill. *All* parties are unanimous upon the great *moral* and *commercial* advantages of the *Penny Postage*. Its expediency as a *financial* step has been the *sole* ground of question; but now, even this *can scarcely be doubted*; for, let it be remembered, that the Old Postage Revenue had been absolutely *stationary* for twenty years,—retrogressive, in fact, if we consider the increase of population, education, and commerce during the period. The change which Penny Postage has effected, is to make the *Post Office Revenue* the *most buoyant* source of National Income, bidding fair to become more profitable than it has ever been. The Committee, therefore, call upon the Public to reward, with suitable gratitude, the Author of this great and triumphant measure.

The Committee have the satisfaction to announce that the Subscriptions, headed by the chiefs of political parties and of commercial wealth, already reach 10,000*l.*; but 1*0*,000*l.* cannot be held to be a sufficient *national* reward for such *national* services. The Committee therefore urge upon the *nation at least to double* this sum. If every letter-writer, for only a single week, would pay a twopenny instead of a penny rate for his letters, the amount, and more, would be raised. In proportion as the public show their gratitude to Mr. Hill, so they strengthen the chances for the complete adoption of his plan, *now but partially carried out.* Its perfection will bring greatly-increased convenience to themselves, and increased advantage to the Post Office Revenue.

Never have the services of any *Public Benefactor* been *requited* as Mr. Hill's have been. Quitting a *permanent* situation for a *temporary* public engagement, to carry out his plan, Mr. Hill's services, whilst his plan was yet not carried out, were dispensed with, and he received the following acknowledgments of his merits, and—*nothing more*:—

"I gladly avail myself," writes the present Chancellor of the Exchequer, "of the opportunity of expressing my sense of the satisfactory manner in which, during my tenure of office, you have discharged the several duties which have been from time to time committed to you." "I entertain," writes Sir Robert Peel (who has also subscribed 10*l.* to the Testimonial), "a due sense of the motives by which your conduct, in respect to Post-Office arrangements, has been actuated, and of the zeal and fidelity with which you have discharged the duties committed to you."—Mr. Trevelyan, on behalf of the Lords of the Treasury, writes thus:—"I am also commanded by their Lordships to take this opportunity of stating, that they consider it due to you, on the termination of your engagement with the Government, to express to you the approbation with which they have regarded your zealous exertions in the execution of the duties which have been intrusted to you; and how materially the efficiency of the Post Office arrangements has been promoted by the care and intelligence evinced by you in the consideration of the various important questions which have been referred to you."

Under these circumstances the Committee call upon the *Public* to come forward with due generosity, and reward Mr. Hill themselves, as the *unrequited Inventor* of the *great measure of Penny Postage*—a measure which has opened the blessings of free correspondence to the Teacher of Religion, the Man of Science and Literature, the Merchant and Trader, and the *whole British Family*, especially the *poorest* and most *defenceless* portion of it;—a measure which is the *greatest boon* conferred in modern times on *all the social interests* of the *civilised world*; for Penny Postage is spreading its influence throughout Europe and reaching even Russia. The Committee rely on the gratitude of their countrymen, and feel sure that this, their last appeal, will not be made in vain.

(Signed) GEO. LARPENT, Chairman.

SECRETARY.—E. RYLEY, Esq.

For Prospectuses and other Particulars apply at the Offices, No. 126, Bishopsgate Street, corner of Cornhill.

NOTICE is hereby given, that the ACHILLES LIFE ASSURANCE ASSOCIATION has been UNITED with the GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY; and the holders of Policies effected with the said Achilles Life Assurance Association are hereby requested to pay the renewal premiums on such Policies at the Office of the Great Britain Mutual Life Assurance Society, No. 14, Waterloo-place, London. E. GILBERTSON, Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE
14, WATERLOO PLACE, PALL MALL, LONDON.

The Chisholm, *Chairman*. W. Morley, Esq., *Dep. Chairman*.

GREAT ADVANTAGES OFFERED TO POLICY-HOLDERS BY THIS INSTITUTION.

A large and immediate accession of Assurances, by the transfer of the Policies of the "Achilles British and Foreign Life Assurance Association."

The whole of the Profits divided ANNUALLY among the Members, after payment of five Annual Premiums.

An ample guaranteed Capital, in addition to the Fund continually accumulating from Premiums *fully sufficient* to afford complete security.

Credit given to Members for half the amount of the first five Annual Premiums, without security.

Credit allowed to Members for the whole of the first five Annual Premiums, on satisfactory security being given for their payment.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Members.

An extremely low Rate of Premium, without participation in the Profits, but with the option, at any time within five years, of paying the difference between the Reduced Rates and the Mutual Assurance Rates; and thus becoming Members of the Society, and entitled to a full participation in the Profits.

Extract from the Reduced Scale of Rates, for an Assurance of 100*l*.

NEISON, Actuary.

BRITISH AMERICA.
Her Majesty's Province of New Brunswick.

TO EMIGRANTS.—THE NEW BRUNSWICK AND NOVA SCOTIA LAND COMPANY (empowered by Royal Charter and Act of Parliament) have resolved to SELL portions of their LAND on the following terms, for Lots of 100 Acres each, viz.,

3*l*. to be paid down.
[No payment required in the Second Year.]
3*l*. to be paid on or before 1st Dec. in the Third Year.
3*l*. ditto ditto in the Fourth Year.
3*l*. ditto ditto in the Fifth Year.
3*l*. ditto ditto in the Sixth Year.
3*l*. ditto ditto in the Seventh Year.
3*l*. ditto ditto in the Eighth Year.
3*l*. ditto ditto in the Ninth Year.
3*l*. ditto ditto in the Tenth Year.
4*l*. ditto ditto in the Eleventh Year.

Ttl. 31*l*. sterling, without any charge for interest.

The territory belonging to the Company is upwards of half-a-million acres, situate in Her Majesty's Province of New Brunswick, between the rivers St. John and Miramachi. Several other rivers run through the tract, on one of which, the Nashwauk, is situated the Company's principal Town and Settlement of Stanley. Here is a church, school-house, and corn and saw-mills, and many houses belonging to resident settlers. The Chief Commissioner and the Company's Establishment are at Stanley, and there is also a resident surgeon.

The passage from the chief port in the Province St. John, to the Company's town of Stanley may be made in 24 hours, at a very moderate expense.

For further particulars (gratis) apply (if by letter, post-paid) to the Secretary, 5, Copthall-court, London; or to Mr. I. I. Birchal, 10, St. Mary's Gate, Manchester.

London, November 16, 1844.

Also, ZADKIEL'S LEGACY, price 2s. 6d., or with his ALMANAC for 1845, price 3s.

News of the Week.

FROM France we learn that the Government, after several months' deliberation, have determined to effect two-thirds of the loan authorised by the Chambers during the last session. In accordance with this resolution, the Minister of Finance has given notice that he will proceed on the 9th Dec. to the public sale and adjudication of 200 millions of francs in Three per Cent. Stock in the usual form for competition. It is said that only two-thirds of the sum originally contemplated will be required for the exigencies of the State, and this fact, taken in conjunction with the rumour that the reserved price will be high, has created a favourable impression of the present prosperity of France. The Duc d'Aumale left Paris on the 12th inst. for Naples, where his marriage with the Princess of Salerno will be solemnised on the 16th inst. The treaty between France and Morocco has been ratified by the Emperor; but the same mail which announces this event brings doubtful tidings of Abd-el-Kader, who has taken refuge in a portion of the country where the Emperor's jurisdiction is little respected.—From Spain we have the details of the Court-Martial on General Prim, which is naturally the chief topic of interest in Madrid. The public have at length been roused from their indifference by the startling doctrine advanced by the Crown Prosecutor, that mere suspicion, unsupported by absolute proof, was sufficient to warrant the Court-Martial to put the accused to death in cases of high treason. This doctrine, worthy of the times of Judge Jeffreys, had created a deep sensation among all classes; and the skill of Gen. Prim's advocate, in appealing against the competency of the tribunal, had caused an unexpected delay in the proceedings, which probably saved him from instant execution. The defence was intrusted to Gen. Schelley, an officer of Irish extraction, and was so ably conducted, that the Court, though avowedly hostile, were compelled to admit that they had not sufficient evidence, and the trial was consequently adjourned for further inquiry. It had been rumoured in Madrid that the British Government had officially informed the Ministry of the sudden departure of Gen. Espartero from London; and great precautions had been adopted by the Government to defeat any attempt at invasion which might be made by the ex-Regent. It appears, however, that the story has no foundation, and that Gen. Espartero is not only now in London, but has never left it for 24 hours since his first arrival in this country.—The long-continued discussion in the Portuguese Cortes relative to the Bill of Indemnity demanded by the Cabinet for their late measures, terminated on the 2d, when the Bill was passed by a majority of 72 to 26.—In Germany, the emancipation of the Jews is daily becoming a question of great political importance. The Prussian Government, it is said, are making inquiries preparatory to the adoption of measures to effect the complete emancipation of the Jews of Hungary have sent an influential deputation to Vienna to solicit the Emperor of Austria to grant his sanction to certain privileges conferred upon their body by the Hungarian Diet. In Russia, however, an appeal made to the Emperor by the Jews of Wilna for admission to the civil rights enjoyed by the Christians, and for exemption from their annual payment in lieu of military service, has not been successful: and the continuance of the tax is required on the ground that their temperance in the use of spirituous drinks fills the public revenue.—From the United States and Canada we have little news beyond the details of the general elections. In Canada, Sir C. Metcalfe has succeeded in almost every section of the province: and it is believed that his new Cabinet will obtain a large majority.

Home News.

COURT.—The Queen held a Privy Council on Friday afternoon, which was attended by nearly all the Ministers. Saturday was the birthday of the Prince of Wales, who has now entered upon his fourth year. The day was celebrated by the inhabitants of Windsor with the usual honours, and the Royal Horse Guards and the 1st Batt. of Fusilier Guards were inspected in the Home Park by Her Majesty and Prince Albert, in the presence of the Prince of Wales and the Princesses. On Sunday, the Queen and Court attended Divine service in the private chapel of the Castle. On Monday, her Majesty and the Prince left Windsor for Buckingham Palace, and in the evening honoured Drury-lane theatre with their presence. On Tuesday the Queen and Prince Albert left town for Burleigh House, on a visit to the Marquis of Exeter, and returned last evening to Windsor Castle. The Duke of Cambridge and a distinguished circle will assemble at Arundel Castle, on a visit to the Duke and Duchess of Norfolk, in the course of the ensuing week.

HER MAJESTY'S VISIT TO BURLEIGH.—Her Majesty and Prince Albert left Buckingham Palace on Tuesday morning for Burleigh, the seat of the Marquis of Exeter. Her Majesty proceeded to the Euston-square terminus of the London and Birmingham Railway, and travelled by a special train to the Weedon station. The royal suite consisted of Lady Portman, the Hon. Miss Liddell, Col. Arbuthnot, Col. Wilde, Lord Delawarr, and Mr. G. E. Anson. Lord Jersey, who had arrived in town the preceding day from Brighton, proceeded to Syston by the 9 o'clock train, from whence his Lordship posted to Burleigh, in order to make the necessary preparations for the reception of Her Majesty. On arriving at the Euston-square terminus, Her Majesty was received by Mr. Glynn, the chairman of the Company, and several of the Directors, and immediately took her departure in the state carriage. The fine weather which has hitherto been the constant attendant of the Queen in her progresses unfortunately deserted Her Majesty during the early part of the morning, as the rain continued to pour in torrents until 11 o'clock, when the sun at intervals made its way through the drizzling mist. The train, which consisted of merely four carriages, with the engine and tender, left Euston-square at 20 minutes after 9, and proceeded at a rapid pace to the Tring station, a distance of 31¾ miles, which was accomplished in 53 minutes; but on arriving at this station Col. Arbuthnot requested that the speed might be slackened, as it was inexpedient for Her Majesty to arrive at Weedon before 4 to 12. A delay of 5 minutes occurred at Tring, during which period Her Majesty was loudly cheered by the country people, who had assembled in great numbers to get a glance at the Queen as she passed. From Tring the train proceeded slowly onwards to its destination, and did not arrive at the Leighton station before 21 minutes to 11; and at the Wolverton station, which is distant 52½ miles from London, within a few seconds of 11. Here there was a considerable assemblage of people from the surrounding neighbourhood, who cheered Her Majesty loudly as the royal carriage was whirled through the crowds which thronged the sides of the railway. The train proceeded, without any further stoppage, through the Roade station, distant 60 miles from London, where it arrived at 18 minutes past 11; and finally arrived at Weedon precisely at 20 minutes to 12, where, of course, the concourse was greater than at any other station on the road. On alighting from the carriage, the Marquess of Exeter, who had galloped over from Burleigh in the morning, advanced along the platform, and received the Queen, who expressed herself much gratified with the preparations made for her reception. Her Majesty was forthwith conducted to the waiting-room, and while the carriages were preparing, entered into conversation with Sir Henry Dryden, the High Sheriff for the county, and Colonel Thorne, Military Commandant of this district, and renewed to Mr. Glynn her expressions of gratification at the arrangements of the railway. Sir Charles Knightley, M.P., Mr. Knightley, and several county magistrates were among the gentlemen assembled in the royal apartments to receive Her Majesty. Soon after 12 Her Majesty entered her travelling chariot, the troops

presented arms, the band of the 47th Regiment played "God save the Queen," and the carriage, with an escort of the 7th Hussars, proceeded rapidly towards its destination, amidst the cheers of the multitude. All along the road, in the vicinity of farms and pretty hamlets, anxious groups might be seen collected, substantial yeomen on fat ponies, their wives in gigs and waggons, flanked by groups of farm labourers, and chubby-faced children, and as the royal party shot past, every little group raised a hearty cheer. Here and there a little triumphal arch had been formed, or a cart or waggon drawn to the roadside, and decorated with ivy and evergreen. The Marquis of Exeter and Sir H. Dryden rode ahead of the royal party at a smart canter. As the royal party neared Northampton, the crowds who lined the way increased, and by the time the town was visible, there was not a cross-road or lane which was not filled with expectant groups. Her Majesty arrived at the entrance of Northampton shortly before 1. On arriving at the West-bridge, the outriders slackened pace, and the horses in the royal carriage immediately pulled up, and proceeded at a foot pace up Black Lion Hill, the mayor and corporation, clergy and inhabitants, heading the cavalcade. The royal *cortège* consisted of three carriages and four, in the first of which rode Her Majesty and Prince Albert, the second and third conveying the lords and ladies in attendance. These were succeeded by carriages and horsemen, the rear of the procession consisting of the members of various lodges and societies bearing wands, and having white favours on their breasts. Nothing could exceed the enthusiasm of the people as the party passed through the town. On arriving at the top of Gold-street, the royal carriage halted for a few moments opposite the George Hotel, where the mayor, by permission of Her Majesty, advanced and presented an address of congratulation from the corporation and inhabitants of the borough. Her Majesty in the most unaffected manner acknowledged it in a few appropriate and expressive words, and was pleased also to express her admiration of the decorations which had been prepared for her reception. Some little obstruction having occurred, owing to the eagerness of the crowd, the progress of the royal carriage was impeded for a few moments, and the Queen employed the interval in conversing with Earl Delawarr, who had previously approached the carriage window, and introduced the mayor and leading officers of the corporation. The procession having again got in motion, advanced along the Market-square and passed down Abington-street, on the road to Burleigh. Here, as on the previous parts of her route, Her Majesty's admiration was excited by the taste and variety of the decorations displayed. Scarcely a single house along the whole line, extending to upwards of a mile, but was enlivened by flags with loyal mottoes, transparencies bearing inscriptions, or wreaths of evergreens suspended from the opposite sides of the street. The royal visit was also celebrated by the erection of five lofty triumphal arches, chequered and festooned with various colours. The reception of the Queen along the whole line was hearty, and evidently sincere, and the feelings with which it was responded to were as obviously genuine and kindly. On the whole, the spectacle was a most gratifying one, and perhaps, on no occasion of a royal appearance, even in London, have the aspirations of loyal attachment expressed themselves in language more emphatic, or dictated by better feeling, than on this passage of the Queen through Northampton. From Northampton to Kettering Her Majesty was escorted by another detachment of the 7th Lancers, under the command of Lieut. Peel, second son of the Premier. The day now again became overcast, and continued dull and heavy. The royal party proceeded by Buttock's Booth, when they changed horses, to Broughton and Kettering. At the latter place the weather got really dismal. A dense watery mist came on with a thin penetrating rain; notwithstanding which the people had assembled in anxious multitudes, and the little town was gaily decorated. Nothing indeed could exceed the neatness and taste very generally displayed all along the road, in getting up the decorations. At Kettering in particular the triumphal arches were well designed and executed, and the number of flags borne by the children, who were ranged in long lines in the streets, made the show a very gay one. Here, as everywhere else, Her Majesty's reception was most enthusiastic. Every window was crowded with smiling faces, and a long range of carts and waggons arranged along the streets, afforded convenient accommodation for hundreds. The Kettering troop of the Northampton Yeomanry was drawn up along the main street and the royal *cortège* passed slowly through it. Almost at every turning of the narrow way there were ornamental devices displayed, banners hung from windows and waving over chimneys, and triumphal arches spanning the little street. Her Majesty passed Kettering about 3 o'clock, the Yeomanry forming her escort instead of the Hussars, who did not go beyond that village. Two miles beyond Kettering stands the village of Geddington, with its richly sculptured cross. The inhabitants turned out in their holiday dresses, flags were flying and the bells ringing merrily. Meldon was the next stage, and it may suffice to say of it, as of the other hamlets which we have not named, that everything that could be done to testify the loyalty of the inhabitants was accomplished. There was all along the route the same enthusiastic display of loyalty, evinced, of course, in much the same manner, and producing a continuation of displays which, however monotonous it may be to describe in detail, yet looked well in reality. At Meldon the horses of the Marquis of Exeter were stationed to convey the royal party the stage between that and Stamford, and at Wakerly-ford 800 of the tenantry of the Marquis, well mounted, were ready, and escorted Her Majesty to the conclusion of the journey. At Stamford, as everywhere else, the most devoted loyalty and attachment were manifested in every way. The royal party entered the town shortly after 5 o'clock, the Mayor and Corporation being assembled to welcome Her Majesty at the entrance. The *cortège* did not proceed more than 30 yards into the town, diverging at once from the main road through the lodge gates leading to the mansion of the Marquis of Exeter, where Her Majesty arrived in excellent health and spirits about half-past 5 o'clock. The Mayor and Corporation of Stamford accompanied Her Majesty to Burleigh House, and when the royal party arrived at a spot near the park-gates, which marks the termination of the borough in that direction, and on which a handsome triumphal arch had been erected, the Corporation took their leave, and retired. The royal party, now accompanied only by the tenantry, passed the park gates and porter's lodge, all of which were brilliantly illuminated, and proceeded rapidly through the lawn towards the mansion. Lamps had been erected along the carriage-way, which were lighted, as it was by this time almost dark, and the bridge crossing the artificial piece of water in the park, called Burleigh-pond, was also fancifully illuminated. As the carriages stopped at the entrance, the band of the Coldstream Guards, which was stationed close at hand, played the national anthem. Her Majesty and the Prince were received in the grand vestibule by the Marquis and Marchioness of Exeter, Lord Burleigh, Lord and Lady Thomas Cecil, and several of the younger members of the family. The guests in the mean time remained in the grand drawing-room. The Marquis of Exeter gave his arm to Her Majesty, while Prince Albert conducted the Marchioness. The Queen was heard to remark to her noble host that she had never been more gratified in any of her progresses than she had been with what she had seen that day. At 8 o'clock dinner was served in the banqueting-hall, a noble chamber, built and fitted up in the Gothic style, with arched roof and carved pillars, lighted by oriel windows, rich with stained glass, and looking over the park. Covers were laid for 40, including the Duke of Rutland, the Duke and Duchess of Bedford, the Marquis of Northampton, the Marquis of Granby, the Earl of Aberdeen, Sir R. Peel, Earl Spencer, Lord Stanley, Lord and Lady Willoughby D'Eresby, Lord and Lady C. Wellesley, Lord Lovaine, the Right Hon. Sir G. Clerk, the Right Hon. P. S. Pierrepont, the High-Sheriff of the county, Sir H. Dryden, &c. After dinner the Marquis gave first, the health of Her Majesty, which was pledged by all the company standing. The health of Prince Albert was similarly honoured. At a quarter to 11 Her Majesty retired, being conducted to her apartments by her noble host. On Wednesday, Her Majesty rose, as usual, at an early hour, and at 9 o'clock attended prayers in the chapel, where the Rev. Mr. Atley officiated. During the visit of Queen Elizabeth to Burleigh she was in the constant habit of hearing Divine service in the same chapel, always taking up her position in a particular spot, which to this day is called "Queen Elizabeth's Bench." Her Majesty is generally extremely fortunate as regards the weather in her excursions; but the visit to Burleigh, so far as it has gone, seems likely to prove an exception. It rained heavily during the latter part of her journey on Tuesday. The deluge continued, with short intervals, all the night, and on Wednesday it was the same, or worse—a weary, unbroken pour, soaking the life, spirit, and beauty out of everything and everybody. It had been arranged, had the weather permitted it, that a shooting excursion in the preserves of Burleigh should take place during the forenoon; this, however, was out of the question, although the keepers remained some time in readiness, in the hope of a favourable change, but none took place. In the course of the morning Her Majesty, accompanied by the Prince, visited the principal parts of Burleigh House, including the valuable and celebrated picture-gallery. In the afternoon the weather brightened a little, and Prince Albert, accompanied by the Marquis of Exeter and Sir W. Middleton, proceeded across the park to the Cottage, a small building appropriated to the collection of bulls in the possession of the Marquis. They are of the Durham breed, of a roan colour, and being very carefully tended, their natural ferocity is subdued, and they are led about by their keepers with great facility. The Prince paid particular attention to these interesting animals, examining their points like a farmer, and complimenting the Marquis's steward on their excellent appearance, after which His Royal Highness returned to the mansion. One of the animals in the herd was recently purchased by Mr. Clark, bailiff to the noble Marquis, of Mr. Unthank, of Penrith, for the sum of 200 guineas. Her Majesty did not leave the mansion, on account of the dampness arising from the continued rain during the early part of the day. At 6 o'clock the ceremony of christening the infant daughter of the Marquis and Marchioness took place in the private chapel within the mansion, the Bishop of Peterborough officiating, assisted by the Rev. Mr. Atlay, private chaplain to the Marquis of Exeter. The Marquis conducted Her Majesty, and the Marchioness of Exeter took the arm of Prince Albert, the other guests following in succession. On reaching the chapel, Her Majesty took up a position near the altar, round which the other principal guests stood. The sponsors were—Prince Albert, Lady Sophia Cecil, and Lady Middleton. The child, in honour of Her Majesty, received the name of Victoria. After the ceremony, which only lasted a short time, Prince Albert presented a superb gold cup to his god-child, with the inscription—"To Lady Victoria Cecil, from her godfather, Albert." Immediately after the christening the display of fireworks took place on the lawn facing the south front of the castle, but, owing to the rain which fell during the day, their effect was greatly lessened. The bridge across the lake was brilliantly illuminated. The banquet took place at 8 o'clock. Sir J. Graham arrived just before dinner, and formed the 41st person at table. After dinner the Marquis, as on the previous day, gave the "Health of Her Majesty," and afterwards that of "Prince Albert." When the toast had been duly pledged, the Queen intimated to her noble host her desire that the health of the infant Lady Victoria Cecil should be drunk. The toast was, therefore, immediately proposed by the Marquis, and received with the usual honours. The Queen left the hall before 9 o'clock, and the evening was passed in the same manner as on the previous day, Her Majesty and the Prince retiring at 11 o'clock. Thursday morning was delightfully fine, and the park, studded with its majestic trees, was set off to the greatest advantage by the rays of an autumnal sun. Her Majesty rose early and breakfasted with the Prince in her private apartments. The Queen did not attend Divine Service with the other guests in the chapel. After breakfast Her Majesty and the Prince walked in the gardens at the back of the mansion, and a splendid herd of dairy cows, of the Durham breed, which roam at will through the park, were brought round for the inspection of Her Majesty. At half-past 10, Prince Albert, accompanied by Sir R. Peel, Lord Stanley, the Marquis of Salisbury, the Marquis of Granby, Lord C. Wellesley, and Mr. G. E. Anson, left the mansion, and proceeded to a preserve called Butland's Cover, on the outskirts of the park, for the purpose of enjoying some shooting. The people of the town and the surrounding districts flocked into the park at an early hour, and a great many of the Marquis's tenantry came from a long distance to testify their loyalty and gratify their curiosity by getting a glimpse of the Queen. The Marquis, with his usual consideration, ordered the park gates to be thrown open for the admission of the public, and at noon the green sward on each side the principal approach to the mansion was studded with vehicles filled with spectators, anxious to get a passing view of Her Majesty as she left the mansion. The carriages were in attendance at half-past 2 o'clock to convey Her Majesty and suite to Grimsthorpe, the seat of Lord Willoughby D'Eresby. This plan, however, was not carried into execution, and soon after 3 o'clock Her Majesty and Prince Albert, attended by the Marquis and Marchioness of Exeter, Sir R. Peel, and the Members of the suite, and followed by many hundred horsemen, left Burghley for a drive, proceeding in the first place to Stamford, where extraordinary preparations had been made for their reception. Her Majesty was welcomed by the people with enthusiastic cheers, and appeared much gratified. After driving through the principal streets they proceeded to Wothorpe, and viewed a waterfall in the neighbourhood, returning thence to the Hall. The banquet in the evening took place earlier than usual, and at 9 o'clock a ball commenced which was kept up to about midnight. Yesterday morning at an early hour the Queen and suite left Burghley for London, by the same route as that previously taken, and arrived at the Euston Square terminus at ½ past 5. Her Majesty proceeded immediately to the Paddington terminus of the Great Western Railway, and left about 6 o'clock by a special train for Windsor Castle.

Death of Lord Saye and Sele.—The daily papers announce the death of Lord Saye and Sele, which took place on Wednesday at his residence in Lower Grosvenor-street. His lordship was in his 76th year, and is succeeded in his title and estates by his only son, the Hon. W. Twisleton Fiennes, who was born in April, 1798.

Baronetcy.—The Queen has been pleased to direct letters patent to be passed under the Great Seal, granting the dignity of Baronet of the United Kingdom to Vice-Admiral Sir William Parker, of Shenstone Lodge, in the county of Stafford, G.C.B., and to the heirs-male of his body lawfully begotten.

The Deanery of Carlisle.—No appointment has yet been made to the Deanery of Carlisle, vacant by the death of the Rev. Dr. Hodgson, although it is confidently stated that the Rev. George Townsend, Prebendary of Durham, will be presented.

Nomination of Sheriffs.—The nomination of sheriffs for the year ensuing took place on Monday in the Court of Exchequer, before the Lords of the Privy Council and the Judges. The following gentlemen were entered on the roll for the undermentioned counties: *Beds.*—W. B. Higgins, of Turvey; A. L. Pfeil, of Swindon; and W. Stuart, of Temford Hall, Esqrs. *Berks.*—J. B. Monck, of Coley Park; W. Stephens, of Prospect Hill; and W. H. Stone, of Wheatley House, Esqrs. *Bucks.*—E. F. Dayrell, of Sillingstone Dayrell, Esq.; Sir W. R. Clayton, of Harleyford House, Bart.; and Baron M. A. de Rothchild, of Mentmore. *Cambridge and Huntingdon.*—J. B. Rooper, of Abbots Repton; J. M. Heathcote, of Connington; and L. Torkington, of Great Stukeley, Esqrs. *Cumberland.*—T. Featherstonehaugh, of the College, Kirk Oswald; J. P. Senhouse, of Nether Hall, and G. W. Hartley, of Rose Hill, Esqrs. *Cheshire.*—Sir W. T. S. M. Stanley, of Hooton Park, Bart.; J. H. S. Barry, of Marbury Park; and R. G. Leycester, of Toft Hall, Esqrs. *Derby.*—T. Pares, of Hopwell, Esq.; Sir R. Wilmot, of Osmaston, Bart.; and J. B. Crompton, of Milford, Esq. *Devonshire.*—E. S. Drewe, of the Grange, Esq.; Sir W. P. Carew, of Haccombe, Bart.; and Sir J. P. Bruce Chichester, of Arlington Court, Bart. *Dorsetshire.*—E. Balston, of Radipole,

C. Packer, of Cliffe House; and T. B. Bower, of Iwerne Muisher, Esqrs. *Durham.*—J. W. Williamson, of Whickham; R. S. Pemberton, of Burnes End and of Usworth House; and E. C. Blackett, of Lockburn Hall, Esqrs. *Essex.*—G. Round, of Colchester; J. C. Whiteman, of the Grove, Epping; and W. C. Marsh, of Park Hall, Esqrs. *Gloucester.*—E. Hopkinson, of Edgeworth House; S. Whittuck, of Hanham Hall; and G. Bengough, of the Ridge, Wotton-under-Edge, Esqrs. *Hants.*—Sir R. G. Simeon, of Swanston, Isle of Wight, Bart.; J. Beardmore, of Fareham; and L. A. Burton, of the Woodlands, Emsworth, Esqrs. *Hereford.*—J. K. King, of Staunton Park; J. Salwey, of Moor Park, Esqrs.; and Sir R. Price, of Foxley, Bart. *Herts.*—Sir H. Meux, of Theobald's Park, Bart.; F. Calvert, of Hunsdon House; and H. S. Burchall, of Bushey Park, Esqrs. *Kent.*—Sir M. Montefiore, of East Cliffe, Knt.; J. Deacon, of Mabledon, Tunbridge; and W. O. Hammond, of St. Alban's, Esqrs. *Lincoln.*—T. Coltman, of Hagnaby Priory; J. B. Stanhope, of Riversby Abbey; and T. F. Johnson, of Spalding, Esqrs. *Leicester.*—W. A. Pochin, of Barkby; W. C. Smith, of Belleswett, Esqrs.; and Sir R. Burdett, of Kirby Bellars, Bart. *Monmouth.*—W. Phillips, of Wheston House; T. Poothera, of Malpas Court; and F. M'Donnell, of Usk, Esqrs. *Norfolk.*—H. D. Hemsworth, of Shropham; T. R. Buckworth, of Cockley Cley, Esqrs.; and the Hon. F. Baring, of Little Buckenham. *Northampton.*—Hon. R. Watson, of Rockingham Castle; A. A. Young, of Oxlingbury; and T. Tryon, of Rulwick, Esqrs. *Northumberland.*—R. Carr, of Edgley; C. W. Orde, of Nunney Kirk; and J. H. H. Atkinson, of Ongerton, Esqrs. *Nottingham.*—W. H. Barrow, of Southwell; J. Vere, of Carlton-upon-Trent; and T. Hall, of Park Hall, Esqrs. *Oxford.*—J. S. North, of Wroxton Abbey; M. Ricardo, of Kiddington; and S. W. Gardiner, of Whitchurch, Esqrs. *Rutland.*—Hon. C.G. Noel, commonly called Lord Visct. Campden, of Flittoris Park; H. B. Pierrepoint, of Rhyhall; and J. Gilson, of Wing, Esqrs. *Shropshire.*—St. J. C. Charlton, of Apley Castle; R. H. Kurchant, of Park Hall; and W. S. Davenport, of Worfield, Esqrs. *Somerset.*—J. L. Lee, of Dellington House; R. M. King, of Pyrland Hall; and J. M. Quantock, of Norton-sub-Hamden, Esqrs. *Stafford.*—C. S. Forster, of Hamstead Hall; J. Levett, of Wychnor, Esqrs.; and Sir E. D. Scott, of Great Barr, Bart. *Suffolk.*—H. Wilson, of Stowlangloft; W. Mills, of Great Laxham, Esqrs.; and Sir R. S. Adair, of Flixton, Bart. *Surrey.*—R. Fuller, of the Rookery, Dorking; C. M'Niven, of Perrysfield, Oxted; and F. Wilden, of Busbridge, Esqrs. *Sussex.*—W. T. Mitford, of Pittshill; W. G. K. Gratwick, of Ham; and J. B. Daubuz, of Offington, Esqrs. *Warwick.*—C. T. Warde, of Clapton House; J. R. West, of Alscote; and T. Dilke, of Maxtoke Castle, Esqrs. *Wilts.*—W. Browne, of Monkton Farleigh, Esq.; the Hon. J. P. Bouverie, commonly called Viscount Folkestone, of Longford Castle; and W. Locke, of Ashton House, Esq. *Worcester.*—T. S. Lee, of Astley Hall; E. G. Stone, of Chambers Court; and W. Hemming, of Fox Lydiatt House, Esq. *Yorkshire.*—Sir W. B. Cooke, of Wheatley, Bart.; T. W. Beaumont, of Bretton Hall; and G. Lane Fox, of Bramham Park, Esqrs. *Cornwall.*—The Council of the Prince of Wales have nominated the following gentlemen for this county: F. Rodd, of Trebartha Hall; A. Coryton, of Pentilly Castle; and J. D. Gilbert, of Trelissick, Esqrs.

Sheriffs for Wales.—The following gentlemen have been nominated to serve the office of Sheriff for the several counties in the Principality for the ensuing year. *Anglesea.*—J. L. H. Lewis, of Henllys; R. J. Hughes, of Plas Llangoed; and N. M. Goddard, Esqrs. *Brecknock.*—D. Price, of Llanthew; M. Morgan, of Bodwigiod; and W. Williams, of Aberpergwm, Esqrs. *Carnarvon.*—R. Morris, of Perthi Llwydion; R. Thomas, of Erw-proll-y-glo; and S. O. Priestley, of Trefan, Esqrs. *Carmarthen.*—J. D. Berrington, of Ystradowen; T. Lloyd, of Llandilo Abercowin; and D. Jones, of Glanbrane-park, Esqrs. *Cardigan.*—J. L. Davies, of Alltyrodin; A. T. Davies, of Tyglyn; and J. Davies, of Trefechan, Esqrs. *Denbigh.*—C. Wynne, of Garthmeilionear; B. W. Wynne, of Garthewin; and R. L. Edwards, of Bronhanlog, Esqrs. *Flint.*—W. Jones, of Hartsheath-park; R. Richardson, of Greenfield-hall; and S. H. Thompson, of Bryncock, Esqrs. *Glamorgan.*—R. Savours, of Trecastle; R. Franklin, of Clementston; and T. W. Booker, of Velindra, Esqrs. *Merioneth.*—R. W. Price, of Rhiwlas, Esq.; Sir R. W. Vaughan, of Nannan, Bart.; and J. G. Griffith, of Faltrenddyn Fawr, Esq. *Montgomery.*—J. Faulkes, of Carno; J. W. L. Winder, of Vaynor-park; and E. Gatacre, of Nantymeiched, Esqrs. *Pembroke.*—A. L. Gower, of Castlemalgwynne; the Hon. W. H. Edwards, of Marloes; and G. H. Carew, of Carew Castle, Esqrs. *Radnor.*—T. Prickard, of Dderw; J. Davies, of Colva; and J. A. Whittaker, of Newcastle-court, Esqrs.

Sheriffs for Ireland.—The following are the names of gentlemen returned by the Judges to serve the office of High Sheriff for the ensuing year: *Antrim.*—J. Leslie, J. White, J. Thompson, Esqrs. *Armagh.*—Viscount Newry, T. M. Jones, M. Cross, Esqrs. *Carlow.*—R. La Touche, R. Doyne, jun., P. Newton, Esqrs. *Carrickfergus.*—S. Dunn, J. Legg, H. Wilson, Esqrs. *Cavan.*—Earl of Bective, A. O'Reilley, H. T. Clements, Esqrs. *Clare.*—E. Fitzgerald, H. P. Hickman, M. Finucane, Esqrs. *Cork.*—Hon. H. St. Leger, J. H. Smith Barry, E. D. Freeman, Esqrs. *Cork City.*—J. Morough, W. Coppinger, H. Townsend, Esqrs. *Donegal.*—Lord G. A. Hill, G. Young, W. Fenwick, Esqrs. *Down.*—H. Montgomery, W. Keown, R. B. B. Houston, Esqrs. *Drogheda Town.*—J. Gernon, St. G. Smyth, W. Cairnes, Esqrs. *Dublin.*—Hon. E. Preston, Hon. E. Lawless, T. Thompson, Esq. *County of the City of Dublin.*—A. Guinness, T. Crosthwaite, A. Boyle, Esqrs. *Fermanagh.*—W. Archdall, J. Richardson, J. N. Blake, Esqrs. *Galway.*—D. Kirwan, Esq., Sir J. F. Ross Mahon, Bart., C. St. George, Esq. *Galway Town.*—P. M. Lynch, L. M'Lachlan, M. Browne, Esqrs. *Kerry.*—C. Galway, W. Gun, W. T. Crosbie, Esqrs. *Kildare.*—Lord W. Fitzgerald, E. H. Cole, W. Palmer, Esqrs. *Kilkenny.*—C. Hely, J. S. Lane, C. Ponsonby, Esqrs. *Kilkenny City.*—C. Savage, J. M'Craith, M. Cahill, Esqrs. *King's County.*—R. Warburton, H. P. L'Estrange, Jun., G. Atkinson, Esqrs. *Leitrim.*—E. K. Tennison, G. Lloyd, L. A. Tottenham, Esqrs. *Limerick.*—E. C. Villiers, W. Barrington, E. Croker, Esqrs. *Limerick City.*—M. Gavin, H. Watson, W. Roche, Esqrs. *Londonderry City and County.*—Sir H. Bruce, Bart, J. B. Beresford, L. Alexander, Esqrs. *Longford.*—G. Lefroy, F. Edgeworth, W. Ledwith, Esqrs. *Louth.*—F. J. Foster, L. Upton, G. Macartney, Esqrs. *Mayo.*—T. S. Carter, C. Kirwan, H. W. Knox, Esqrs. *Meath.*—Lord Killeen, J. Waller, H. Coddington, Esqrs. *Monaghan.*—S. R. B. Evatt, A. A. Murray, T. O. Forster, Esqrs. *Queen's County.*—Hon. H. G. F. Walker, C. Coote, H. Rochfort, Esqrs. *Roscommon.*—Sir G. King, Bart., J. F. Grace, G. O'Moore, Esqrs. *Sligo.*—E. J. Cooper, P. Perceval, J. W. King, Esqrs. *Tipperary.*—J. Bayley, Lieut.-Colonel W. Purefoy, J. Trant, Esqrs. *Tyrone.*—G. D'Arcy, F. Gervais, R. Lloyd, Esqrs. *Waterford.*—J. B. Gumbleton, J. H. Keane, S. Bagge, Esqrs. *Waterford City.*—J. Penrose, T. Sheppard, W. S. S. Doyle, Esqrs, *Westmeath.*—Hon. L. H. K. Harman, Sir F. Hopkins, Bart., J. H. Fetherson, Esq. *Wexford.*—P. W. Redmond, H. Alcock, E. W. Nunn, Esqrs. *Wicklow.*—R. A. G. Cunningham, W. W. F. Hume, C. Tottenham, Esqrs.

Foreign.

FRANCE.—The *Moniteur* of Sunday publishes a royal ordinance, authorising the Minister of Finance to complete a loan of 200 millions of francs in Three per Cent. Stock by public tender, and in sealed offers, the loan to be adjudicated to the parties who offer the most favourable terms above the *minimum* to be fixed by the Minister. The stock will bear interest from the 22d December. In execution of this ordinance, the *Moniteur* publishes a notice from the Minister of Finance, stating, that he will proceed on Monday, the 9th December, at his office, to the public sale and adjudication of the above loan of 200 millions in the usual form for competition. It is stated that four parties propose bidding, viz., De Rothschild Brothers, Baring Brothers (in conjunction with the Receivers-general), Durand and Co., and Charles Laffitte, Blount, and Co. The supposition that only 200,000,000 (8,000,000*l.* sterling) will be required, and that the *minimum* reserved or upset price will be high, has induced, instead of a depression, a rise in the price of stock—a rare, and perhaps unprecedented result of the expected creation of a new debt to the extent of 8,000,000*l.* sterling. On this point we may remark that the *Débats* considers the present circumstances of the country to be so favourable that it anticipates French Three per Cents. at 90 as soon as this financial operation is determined. The *Moniteur* also publishes a royal ordinance for the trial of the system of atmospheric railways between the Nanterre station of the Paris and St. Germain railway, and the Plateau of St. Germain, and approving of the convention for that purpose entered into between the Minister of Public Works and the St. Germain company.—The re-organisation of the Polytechnic School has commenced in Paris.—On Thursday the members of the Conseil de Perfectionnement, and the professors and officers attached to the school, waited in a body on Gen. Boileau, who has quitted the command of the establishment, to pay him a farewell visit. In the course of the afternoon the General left the school, and the new commander, General Rostolan, was installed in his place.—The Duc d'Aumale left Paris for Naples on the 12th inst., accompanied by the Prince de Joinville. They embark on the 16th, at Toulon, on board the Gomer for Naples. They expect to arrive at Naples on the 20th, and on the 25th, the anniversary of Louis-Philippe's marriage, the Duc d'Aumale will be married to the Princess of Salerno. The Prince and the young Princess will leave Naples on the 1st of December, on their way back to France.—In the absence of news of a more stirring nature, two of the papers devote several columns to an examination of the question of the communication with the East by way of Suez, suggested by a letter from Mr. Waghorn to the Pacha. In considering whether a canal or railroad would be preferable, the Ministerial *Débats* concludes in favour of a canal, which it hopes would restore much of the trade of the East to Marseilles, as also to Trieste, Genoa, and Venice. It strongly urges the Pacha to undertake the work at his own expense; and says that while the revenue to be derived from it would amply repay him for the cost, the work would confer honour upon him for ages to come. M. Thiers's organ, the *Constitutionnel*, merely supposes that England has some selfish motive in proposing a railway.—The difference which had arisen between Baron Seguier and the members of the Paris bar, who had refused to plead in the chamber of the Royal Court, of which he is the president, has been satisfactorily arranged. On the 4th, the day on which the courts were solemnly re-opened, when the newly-elected members of the council of the advocates, headed by their chairman, M. Chaix d'Est Ange, presented themselves to take the oath, Baron Seguier rose, and addressed them in terms expressive of his esteem for their character, and confidence in their talent, which were considered by the bar as an ample satisfaction. The members of the council accordingly met after the sitting, and unanimously agreed to resume the exercise of their profession in the first chamber of the Royal Court.—M. de Nyon, the French Consul-General at Tangiers, arrived at Toulon on the 4th, from Morocco. The treaty with France has been ratified by the Emperor of Morocco, and the *Débats* gives the details of the interview between the Duke of Glucksberg and the Pacha of Larache upon the occasion. The same paper states that Abd-el-Kader has taken refuge near Miliana, a part of the country where the jurisdiction of the Emperor of Morocco is not much respected. The *National* mentions that the French Government, enlightened by the information received as to the causes which led to the late war with Morocco, are about to appoint a special agent to reside with the Emperor of Morocco, and to remain in constant communication with him.—The Italians residing at Paris intend to have a medal struck and a funeral service celebrated for the brothers Bandiera and the other martyrs of the Italian cause executed in the kingdom of Naples and in the Papal States. M. Gallotti, well known for the part he took in the events of Naples, in 1821 and 1828, presented himself a few days ago, with some of his countrymen, in different churches of Paris to order that service. The clergy, however, declined to acquiesce in their request. The funds intended for that object will accordingly be applied to complete the subscription to the medal which the Italian Liberals, without any distinction of party, have determined to devote to the memory of those victims.—A German Journal states, that a French company is about to be formed for establishing a line of steamboats between Havre and Tonningen, a port in Denmark, for the purpose of bringing into France supplies of cattle from Jutland and Schleswig. This undertaking is expected to be very beneficial to the railroad between Flensburg and Tonningen.—The Papers announce the death, at Paris, of Madame Charlotte de Grouchy, widow of the celebrated Cabanis, at 76 years of age. This lady, distinguished for her amiable qualities, lived in the society of the most remarkable philosophers of the end of the 18th and the beginning of the 19th centuries. She was not less esteemed for her wit and varied information than for the charm and elegance of her conversation, her kind disposition, and her benevolence. Madame Cabanis was sister to Marshal Grouchy, and sister-in-law to the celebrated Condorcet.—It is announced in London that a Life of Sir Hudson Lowe, by his son, is on the point of making its appearance. *Apropos* to this announcement, the *Courrier Francais* states that "Gen. Montholon has taken the opportunity of his long confinement in the Castle of Ham to arrange the various documents which he brought from St. Helena. It is probable that the work of M. de Montholon will rectify many erroneous statements which have been published and received as authentic relative to the six years' residence of Napoleon at St. Helena."—We noticed in our last the remarkable fact that 10 communes in the department of the Vau had embraced Protestantism. The Paris Papers of this week state that while members of the Oxford School are embracing Catholicism, the whole population of the commune of Villefavard, in the department of La Haute Vienne, containing 600 souls, with the priest of the parish, and the Mayor at its head, have just joined the Protestant Church. It appears that the Prefect of the department had some time ago opposed the establishment of Protestant worship at Villefavard; but the Minister of Justice, in answer to the representations made to him on the subject, authorised the establishment of a Protestant chapel in the commune; and on the 7th July last, divine worship according to Protestant forms was solemnly begun in that place, in the presence of the municipal authorities. A similar conversion begins to manifest itself in the environs of Matha, in the department of La Charte Inferieure, and in 25 of the surrounding parishes.

SPAIN.—We have accounts from Madrid to the 5th inst. It was rumoured that M. Martinez de la Rosa had received a note from Mr. Bulwer announcing that General Espartero, who was said to have been indisposed, had disappeared from London, and that the British Government was not apprised of the direction he had taken. This report had caused considerable sensation, and the Government had immediately forwarded orders to the authorities on the land frontiers and along the coast to take measures to defeat any attempt at invasion likely to be made by the ex-Regent. It appears however, that Espartero is still in London, and that he has never been absent from it for 24 hours since his first arrival as an exile. The discussion in the Chamber of Deputies on the address was proceeding, but as the paragraph in favour of the constitutional reform has been adopted, the debates offer no striking interest. The only fact of importance is the declaration made by M. Mon, the Minister of Finance, that the payment of the December dividends was secure. The report also of the committee of the Chamber, on the project of constitutional reform, has been presented. It is a very lengthy document, but the only changes which it makes in the Government plan are those which we have already announced, namely, with regard to the prevention of the present or any future Sovereign of Spain from contracting marriage with any member excluded from the succession to the throne. The

trial of General Prim is the principal topic of interest in Madrid. Every one was shocked at the horrible doctrine unblushingly put forward by the public prosecutor, that a simple indication, without absolute proof, was sufficient to warrant the court-martial to put the accused to death in cases of high treason. It was believed that the intention of the Court party was to avenge upon Prim the death of Diego Leon; and that had Don Mariano Lopez, the advocate for Prim, not appealed against the competency of the court-martial, the intention was, that he should be tried and sentenced on one day, and shot with his companions on the following morning. This appeal caused a delay of a week, and on the 4th General Prim and his co-accused were brought before a court-martial, their appeal on the ground of the incompetence of the military tribunal having been rejected, as might have been expected, seeing that the decision turned not upon the ordinary law, but on the decision of the military tribunal itself. The court is composed of seven general officers, and the person chosen to preside over it is no other than General Mazzeredo, the Captain-General of Madrid, and the intimate friend and dependent of General Narvaez, and his tool in all his recent tyrannical proceedings in the capital. The other members are all dependents of the Government. The defence, on the part of General Prim, was read by General Schelly, from a manuscript drawn up by the two counsel for the defence. None but written evidence was produced. The General protested with energy against the competence of the tribunal, and the form of the proceedings. He complained of the manner in which the evidence for the defence had been taken; and especially that the servant of General Prim, in whose possession the *trabucos* were placed, had not even been listened to by the public prosecutor. He also complained that the accused had not been confronted with his accusers or the witnesses. General Schelly then entered into a history of the life of General Prim, and concluded by declaring that a brave man could not be a traitor. The defence of the other prisoners was then read by officers appointed for that purpose; and so carelessly were they chosen, that one of them was not able to read the defence put into his hands, and another had to be taken from the audience to perform the office. The prisoners were not present during the proceedings. After the reading of the defence, the public were excluded from the hall, and the court entered into deliberation; but after an interval of an hour and a half the doors were again opened, when the President declared that the court did not consider that it had sufficient evidence before it, and that it would proceed to make further inquiries.—The Barcelona journals of the 5th inst. mention the execution, on the preceding day, of Don Antonio St. Just, the son of the unfortunate General murdered some years ago in a riot at Malaga: the son had been condemned to death for participation in the Centralist conspiracy last year. Letters from Tarragona state that several arrests have taken place in that city; amongst the number was the noted Guardiola, formerly aide-de-camp to Zurbano. He is said to have made some important revelations. Some riotous proceedings have taken place at Seville, but they were speedily put down by the authorities, and several arrests have taken place.

Portugal.—We have accounts from Lisbon of the 5th inst. The sessions of the Cortes during the preceding week offer nothing extraordinary or likely to interest an English reader. The discussion which has continued so long, relative to the late measures adopted by the Government, and brought forward for the approval of the Cortes, terminated on the 2d, when the Bill of Indemnity was passed by a majority of 72 to 26. In Lisbon all is quiet and peaceable. The heavy rains have set in, and the inundations have already commenced their destructive inroads over the low lands up the country. The vintage has been but poor this year, and the crop of oil scarce and rising in price. A convention has been entered into between France and Portugal for the establishment of a line of steam-packets of the Royal Navy of France, communicating monthly between port St. Nazario (near Nantes), Lisbon, Madeira, Fayal (perhaps) St. Iago of the Cape de Verdes, Goree, Rio Janeiro, Monte Video, and Buenos Ayres. The relations between France and Portugal, the Journal of the Portuguese Government truly observes, will be more strongly cemented by means of this convention.

Holland and Belgium.—The German Papers state that the report of a union between Holland and the Zollverein appears to gain ground. It is said that the King of Holland has addressed an autograph letter to the King of Prussia on the subject, and that the free navigation of the Rhine would be one of the concessions made by the Cabinet of the Hague.—Letters from Batavia, dated 21st August, have reached the Government by the Overland Mail, announcing the death of his Excellency Baron Merkus, the governor-general. Mr. Reynst, Vice-president of the Council of India had, on the 5th August, assumed the government as Governor-general, until His Majesty's pleasure be known.—The Brussels Papers state that on comparing the taxes paid in Belgium, it has been found that the average of the sums paid by every individual is less than in France, in the Netherlands, and in England. For Belgium, it is 19f. 86c. per head; for France, 30f. 68c.; for the Netherlands, 39f. 63c.; for England, 56f. For the duties of Customs, Excise, and of general consumption, the average is as follows:—For Belgium, less than 8f.; for France, more than 12f.; for the Netherlands more than 16f. 69c.; for England more than 38f.

Germany.—The *Berlin Gazette* states that the King of Saxony had joined the King of Prussia at Letzingen, where their Majesties were to enjoy the amusement of hunting. The exhibition of national industry to take place in that city promises to be a very grand affair. It was calculated that there would be about 3000 exhibitors, taking all the states comprised in the Zollverein, and that the number of objects would be 30,000. We also learn from Berlin that the works of the railroad from Potsdam to Magdeburg have been commenced; and that, as the road will traverse a portion of the royal park, the King takes a personal interest in the undertaking, and occasionally superintends it. The question of the emancipation of the Jews, it is said, seriously occupies the attention of the Prussian Government. A formal demand has been addressed to the Government of the Grand Duke of Baden, to ascertain what has been the result of their emancipation in that country. It is believed that when the reply is received the Prussian Minister will take measures to carry the contemplated emancipation into effect. In connection with the same subject we learn from Vienna that the two Chambers of the Hungarian Diet, in their last session, passed a law for granting to the Jews the greater part of the rights enjoyed by the people who are not noble, but it did not receive the royal assent. These Chambers have now voted another bill, the objects of which are, first, to confer on the Jews the right of living in all the towns of the kingdom, indiscriminately, and there carry on their trades and professions, even some of the learned professions: secondly, to abolish the special capitation tax imposed upon them. The Jews have sent a deputation to the Emperor of Austria, as King of Hungary, to supplicate His Majesty to grant his sanction to this measure. It is composed of the Grand Rabbi, and six distinguished merchants of Presburg, and has been received by the Minister of the Interior, Count Kollowrath, who has promised to solicit the Emperor to grant it a private audience.—The Papers state that the Duke of Bordeaux is about to proceed to Bohemia to hunt on the estate of the Prince de Rohen. It was remarked that he had become extremely corpulent, and bore the appearance of a person of 40 years of age, rather than that of a young man of 24.—A letter dated Mentz, 1st inst., states that an electro-magnetic telegraph, on Mr. Faraday's plan, has been attached to the Taunus Railroad, which lies between that city and Frankfort-on-the-Maine, the extent of which is about 16 French leagues.—The *Wurtemberg Gazette* publishes a treaty between the Government of Wurtemberg and that of the United States of America, for the mutual abolition of the tax gration.—We learn from Dresden that while the family of Weber were expecting his remains for interment, their number was reduced by the death of his younger son, a youth of twenty, who was studying painting with the most brilliant hopes of success. Only one son now remains.—The *Augsburgh Gazette* of the 1st inst. announces the first appearance of Fanny Elssler at the Court Theatre of Munich on the 30th ult. She was most enthusiastically received, and she was repeatedly recalled to receive the homage of the public.—The number of Protestants at present in Bavaria is 1,226,753. In the last four years there has been an increase of 25,531; in that period 8805 Protestants emigrated from the kingdom, 281 turned Catholics, and 179 Catholics became Protestants.—Letters from Treves state that several parish priests in that diocese positively refused, during the exhibition of the holy garment, to accompany parishioners to see it, and even dissuaded them from undertaking this pilgrimage. By this conduct those priests have, it seems, drawn upon themselves the anger of the bishops, and expect shortly to be accused of Hermesianism.

Switzerland.—The Swiss Journals state that a new bishopric is about to be established in the canton of St. Gall. All the articles of the treaty concluded with the Court of Rome have been adopted without change, notwithstanding a strong objection made by the radical fraction of the Catholic Council, who combated it at every stage, without being able to gain an inch of ground. The plan was adopted by 58 against 13.

Italy.—A letter from Trent, of October 25, says:—"The extensive and fruitful valley of the Adige has been inundated. On the 21st the rise of the river was 9 feet, and at present amounts to 13½ feet above the usual level. The neighbourhood of Trent is entirely under water. In the Campo Trientino the water is 7½ feet deep, and Centa, Stella, Alta, and Bassa Livorno, and Ischia Perotti, form one immense lake. Several streets of Trent are filled with water, the inundation proceeding not only from the Adige but the little river Salaga, now a formidable torrent. The Pont St. Laurent has begun to totter. Provisions are conveyed in boats. The consequences of this calamity are terrible to think of."—Another letter from Leghorn of the 6th inst., gives a distressing account of the disasters occasioned by the overflowing of the Arno. Florence was partly under water, which in some places was 8 feet deep. The inhabitants were blockaded in their houses, unprovided with food, and subjected to the agonies of hunger, and terror for their lives. The Suspension-bridge over the Arno had been carried away by the flood, the old bridge of the Goldsmiths was threatened with ruin, the Customs stores and the fine promenade of the Cascine were completely inundated. The Arno carried along a quantity of agricultural implements, furniture, and cattle, and the plains of Tuscany, watered by the river, presented the aspect of immense lakes. The railroad between Leghorn and Pisa was so deeply sunk in the water that the communication had been interrupted. The losses are incalculable. The government, equally taken by surprise as the public, could not afford any adequate succour. Several persons are said to have perished, but in the present state of things it is impossible to acquire any accurate information, and the rumours are probably much exaggerated. Great apprehensions are entertained for Pisa. At Genoa, also, inundations have taken place and caused considerable damage.

Russia.—The last accounts from St. Petersburgh express serious alarm relative to the health of the Empress. The pain of the chest, with which Her Majesty is affected, has become more violent.—The Duke de Leuchtenberg left on the 20th ult. for Munich, on a visit to his mother and his sister, the Dowager Empress of Brazil.—The Russian journals publish the copy of a convention concluded at Teheran on the 3d July last, between the Courts of Russia and Persia. According to the first article, the subjects of the two Powers cannot hereafter pass from one country to the other without passports. Article 2. Every individual passing from one country to the other without a passport shall be arrested and delivered up to the proper authority, with all his clothing, accoutrements, &c. Article 3. Every demand addressed by any subject to his government for permission to emigrate shall be made without any foreign intervention.—The new military law respecting the Jews, published last year, induced the elders of the Jewish community at Warsaw to send a deputation to St. Petersburgh, in order to petition the Emperor to place the civil condition of the Jews on the same footing as that of the Christians, in reference to the law of 1817. In the imperial decree issued at that time, it is said that the Jews residing in the kingdom may be exempt from the military conscription and military service, so long as they are not admitted to civil rights, and pay to the Polish treasury 105,299 silver rubles annually. It was intimated to the deputation that they should receive an answer at Warsaw from the Governor-General of the kingdom. This answer has now been given, but it by no means corresponds with the desires of the petitioners. They are told that they are not to appeal to the law of 1817, because the grant of civil rights was an act of imperial favour. But with respect to the money paid for exemption from military service, it was considered to cease on the introduction of the military conscription, according to the literal tenor of the law; but for the present, the fixed sum must continue to be paid, "because the Jews, by their temperance in the use of highly-taxed liquors, brandy for instance, diminished the public revenue."—The Russian Government has published the account of the produce of the mines in the Ural mountains in the first six months of 1844. The mines of the Crown yielded 68 poods 29 lbs. of gold, and those belonging to private individuals 164 poods 13 lbs.; in all, 233 poods 2 lbs. (the pood is 40 lbs. Russian, 36 lbs. English). Of platina, the mines of private persons yielded 75 poods 5 lbs.; those of the Crown only 3 lbs.

United States.—By the steam-ship Acadia we have accounts from New York, to the 1st inst. There is nothing by this arrival of much interest to the English reader. The elections are still the great staple in American politics. Upon them attention was exclusively fixed, and both parties claim a victory as far as they have yet proceeded. The State of Pennsylvania had, it is said, by a large majority declared for the Whigs.—A hurricane at Buffalo, which occurred on the 19th October, and swept away half the pier, upon which the inhabitants greatly prided themselves, forms a leading topic in the papers. A good many lives were lost in the confusion, and it was feared much damage to the shipping off the coast would be heard of. The indefatigable enemy of slavery, Mr. John Quincy Adams, had delivered a long address at Boston on the subject of the annexation of Texas—a project to which he is warmly opposed, and against which he urged strong reasons. A new sect under the name of Millerism is making considerable progress in some parts of the States; and as one of its leading tenets is the speedy approach of the end of the world, many tradesmen had discharged their workmen, believing that the world would not last beyond the 21st ult., and probably not beyond the 10th.—The Canadian Papers are mainly filled with electioneering news. Sir C. Metcalfe has succeeded in the elections almost in every section of the province. Up to the latest dates, accounts have been received of the election of 25 Conservatives, 15 Oppositionists, and 5 Uncertain.

West Indies and South America.—By the mail-steamer Trent, we have advices from Jamaica to Oct. 10, and from the other islands to corresponding dates. During her stay in the Gulf of Mexico the Trent experienced very severe weather, and was obliged to leave Tampico without being able to ship the treasure, amounting to 1,721,567 dollars, 80,000 dollars of which was on account of the Mexican dividends, which was all brought to the bar. The Trent remained off the bar till the 29th September, in the hope of its becoming passable, but as the weather continued bad she was obliged to leave and continue her route. At Vera Cruz all the treasure was shipped on the 2d of October during a heavy norther, with the exception of 130,000 dollars, on account of the Mexican dividends, which the Administration would not run the risk of embarking under such circumstances.—Santa Anna was at his farm near Vera Cruz, and was increasing the number of his troops, with a view to compel the Senate to comply with his views. He was about to marry again into a family at Vera Cruz, his first wife having been dead about a month.—The trial of Mr. Bagot, in British Guiana, had terminated by his being found guilty of official delinquency, and dismissed the service.—In the majority of the West India Islands the crops promised well, and the

reports from Barbadoes, Trinidad, Demerara, and Jamaica, show that the planters looked forward with some expectation to next year's growth. Political affairs were very quiet, and no great complaints are made of the want of regularity on the part of the labouring population. The Governor of Jamaica had issued his proclamation for the assembling of the new Legislature, and proceeding to business on the 15th October. The convocation of the House thus early was attributed to the measures taken in England with respect to immigration from India. The census returns in Jamaica had been made, showing a population of 377,433 souls, of whom 183,633 were males, and 195,800 females. The excess was maintained in the three classes, white, coloured, and black. There were of the first 15,776, of the second 68,529, and of the third 293,128.—The island of Cuba was, on the 2d October, visited with a terrific hurricane, which continued, however, only a few hours, passing over without doing much damage from that time until the morning of the 4th, when it commenced raining and continued so during the day. The wind at first blew right from N.E., veering afterwards to E.; and at dusk it became a calm. At this time the thermometer was at 19 Reaumur. It begun to blow at 8 P.M., and also rained. At 9 and 10 P.M. the wind blew a hurricane, and increased during the whole night, with occasional flashes of lightning, accompanied with great destruction of property in the city of Havannah. The principal damage to the houses was sustained in the suburbs, but scarcely a house escaped without injury. —Accounts from Lima, of Aug. 10, state that Vivanca has been defeated, and having been brought prisoner to that city, was banished to Mexico by the Constitutional Council. General Castello has taken possession of Arequipa, and is now advancing upon Lima, and it is supposed that the Council will not oppose his authority.

CITY.

Money Market, Friday.—Consols for account closed at 100¼; Red. Three per Cents., 99½; New Three and a Quarter, 102; Bank Stock, 204½; Exquer Bills, 56 to 58 pm.

GAZETTE OF THE WEEK—BANKRUPTS.—J. Cox, Norwich, cabinet maker—J. Jones, Berners-street, Oxford-street, apothecary—W. Sawyer, Louisa-street, Stepney, oilman—J. S. Burrows, Wimbledon, Surrey, coal merchant—J. D. Bates, Chapman-street, St. Georges-in-the-East, gingerbeer manufacturer—A. Hoggins, Apollo buildings, Walworth, merchant—E. Kinsey, Newtown, Montgomeryshire, innkeeper—G. Vaughan, Llanelly, Carmarthenshire, innkeeper—J. Vaile, Cheltenham, wine merchant—H. Oliver and H. Hastings, Cheltenham, butchers—W. Norwood, Kettering, Northamptonshire, grocer—J. G. Bourne, Battersea, builder—J. F. Barwick, Old-street, St. Luke's, wheelwright—G. F. Davidson, Johnstreet, Adelphi, merchant—J. Sedman, Queen-street, Cheapside, colour merchant—T. Boulter, Cromer, Norfolk, innkeeper—R. Barry, Worthing, lodging-house-keeper—C. Soul, Long-alley, Moorfields, grocer—W. Collinson, East Butterwick, Lincolnshire, shipwright—J. Watson, Carlisle, grocer—T. Dowding, Chippenham, Wiltshire, brewer—W. Jones, Usk, Monmouthshire, linendraper—J. C. and H. Colville, Liverpool, merchants—E. Corbett, Redditch, Worcestershire, grocer.

BANKRUPTCY ANNULLED.—J. T. and W. Wilde, Basing lane, Cheapside, general merchants.

SCOTCH SEQUESTRATIONS.—K. M'Leod, Portmahomack, Rossshire, merchant—T. Lyell, Newburgh, manufacturer—J. Wilson, Edinburgh, general agent.

Metropolis and its Vicinity.

The Lord Mayor's Day.—The ceremony of inaugurating the new Lord Mayor in his civic office took place on Saturday, and excited much more than the usual interest from the previous clamour raised about him, and from the expectation that a hostile demonstration would be made. The streets were crowded with spectators. The procession was marshalled in the Guildhall yard rather before the customary time, and was in marching order by ½ past 11. The police mustered in great force, and a detachment of Lancers, with their band, accompanied the procession. The advanced ranks of the pageant did not exhibit much difference from the ordinary Lord Mayor's Show, though there were fewer of the City Companies with banners and ensigns. When the Lord Mayor's coach approached the barrier, such a complication of noises arose that the horses turned restive, and the hind wheel of the coach got locked in one of the posts, which detained it for some time, thereby giving an ample opportunity to the dense crowd to express their feelings towards his lordship. Yells, shouts, and hisses, mingled with cheers, the former, however, greatly preponderating, greeted him from every quarter, amidst which even the kettle-drums and trumpets of the Horse Guards were undistinguished. At last the obstruction was removed, and the Lord Mayor advanced amidst a fresh burst of mingled hissing and applause. Next came the late Lord Mayor, when the people called out "Cheers for Magnay," which were heartily given. The police officers and the cavalry gathered round the carriage and kept off the mob; but no police regulation could stop the noises of all kinds with which the Lord Mayor was assailed. In this manner the procession passed through Princes-street, and King William-street. In coming up Walbrook, the Lord Mayor's own ward, his reception was somewhat better. A great many handkerchiefs were displayed from the windows of his friends, and some hats were waved in the streets. This scene continued with occasional variations to Southwark Bridge, where the procession embarked for Westminster, amidst renewed confusion. In his passage up the river, and on his landing at Palace-yard, the Lord Mayor was greeted with a fresh storm of hissing, mingled with cheers from his friends. The Recorder then introduced the Lord Mayor to the Lord Chief Baron of the Exchequer and the other Judges, and after the usual complimentary speeches, the oaths of office were administered. The Lord Chief Baron then communicated Her Majesty's approval of the election, dwelling particularly on the fact that the Lord Mayor had been chosen by the Livery in the exercise of an undoubted right to choose their own Chief Magistrate. The ceremony was concluded by the Recorder, in the name of the Lord Mayor and Sheriffs, inviting the Judges to the entertainment at the Mansion House in the evening. It is worthy of remark, that, contrary to all precedent, only three of the Aldermen, viz., Aldermen T. Wood, Farncomb, and Challis, none of the City Members, none of the Common Council, none of the representatives of the City Companies, and no members of the Court of the Company to which the Lord Mayor belongs, were present at his inauguration. After the ceremony, the procession returned to the City, proceeding down the river, and landing at Blackfriars-bridge, amidst a storm of hisses and cheers. By this time the crowd had greatly increased. Bridge-street, Blackfriars, and Ludgate-hill were well nigh crammed, and all the windows and every spot commanding a view were occupied. The reception of the Lord Mayor was of the same character as during his progress in the morning. The procession was considerably lengthened on the return by the carriage of the Lady Mayoress, and by the carriages of many of those who had been invited to partake of the civic banquet. The Ministers and majority of the company, who usually join the Lord Mayor at Ludgate-hill, went to Guildhall at a later hour, without joining the procession. The inauguration dinner took place in the evening at the Guildhall, and was attended by two of the Ministers, Sir J. Graham and Mr. Gladstone; by the French Ambassador, several Judges, and other guests. After the usual loyal and routine toasts, Sir James Graham proposed the health of the Lord Mayor, and said, "I appeal to this great assembly whether it be not just, whether it be not generous, to anticipate that your Lordship, filling the high office which you now hold by the voice of your fellow-citizens, will emulate the example of your predecessor, and honourably and faithfully fulfil the high duties and important functions of that office to which you have been elevated by the choice of the Livery, by the approbation of the Court of Aldermen, and by the full and entire approbation of your Sovereign. Feeling that he whom the citizens of London have thought worthy cannot be unworthy, it is with great satisfaction that I have to propose "The health of the Lord Mayor of the City of London." The Lord Mayor, in returning thanks, said, "I feel deeply indebted for the very kind manner in which Sir J. Graham has done me the honour to propose my name to your notice. I feel on the present occasion that I ought to speak with deep humility. It becomes not him who putteth on the harness to boast like him who putteth it off. All I can say is, that all my anxiety shall be to endeavour firmly to discharge the duties of Lord Mayor."—On Sunday morning the Lord Mayor attended divine service at Christchurch, Newgate-street, of which his son and chaplain, the Rev. M. Gibbs, is the incumbent. The congregation was large, there being scarcely a seat vacant, while the passages were crowded. When the sermon had concluded, and while the collection was being made, a large number of persons assembled under the portico of the church, under the archway in Christchurch-passage, and in Newgate-street, though it was raining fast, evidently waiting to see the Lord Mayor. As his lordship walked towards his carriage, which stood in Newgate-street, hissing and other expressions of disapprobation arose from every side, and remarks far from complimentary were made. Many persons endeavoured to stop these expressions, and cried "Shame, shame. Have respect for the place;" but the hissing, though subdued, continued as his lordship walked slowly through the crowd to the street. Upon entering the carriage the hissing became much louder than before, accompanied by groans and allusions to the affairs of St. Stephen's, Walbrook, and some men, the most active in these demonstrations, ran after the carriage, hooting and yelling.

Destitution in the Metropolis.—The morning papers record almost daily fresh instances of death or suicide attributed to the repugnance of the poor to enter the Union workhouses. Among the most distressing of these cases reported this week are those of Mary Alloways, a poor needlewoman, and Mr. Mason, a decayed merchant. Mary Alloways destroyed herself by oxalic acid, leaving on her table a letter written to a friend shortly before her death, stating that she could no longer bear up against the continuance of her misery. The letter said:—"Dear Friend,—I have spent many anxious days and sleepless nights. I cannot obtain work; therefore it is impossible I can pay my rent, and I have preserved my watch as the only means that I have to put me in the ground. I have had it valued at 10*l.* I judge that it will not cost more than 5*l.* to lay me in the grave in a humble way. The life I now live is a miserable one, and has been for several years. I have no one to care for me. Heaven is merciful. Yet a little while, and this feverish and unquiet spirit I most sincerely hope will be at rest, with the hope that the Almighty will pardon me. Was I sure of that, I should leave the world without the least regret. I must chance what many great people have done before me. I am obliged to all my friends that have been kind to me. My dear friend, I hope you will let some one follow me to the grave, but that I leave to you. I do not wish any one here to know my affairs. You will do as you please with my clothes. I am sorry to say that I owe Mrs. White this day seven weeks' rent (Nov. 5). I am very sorry to leave the world in debt. If my clothes and watch will not pay the expenses of my funeral and rent, it is my wish to be sent to the workhouse. My watch you will find in the large trunk. Adieu. God bless you all. My pen is so bad, I fear you will not make out what I have written, and my mind is agitated." The poor creature lodged in the back attic of a house in Market-row, Oxford-street. She had made no complaint of illness on the day that she was last seen alive, and the extent of her distress was not known in the house. Indeed, Mrs. Jones, a lodger, with whom she had taken tea and sat in conversation until 10 o'clock at night, when she went to bed, stated that she was supposed to have a "respectable income," so effectually had she concealed her destitution. Mr. Wakley, the coroner, after the inquest feelingly recounted the distresses of the poor woman. "She appeared," he said, "to have been a sensible, high-minded woman, and, seeing that poverty was now treated as a crime, she shrank from making her situation known, and so silent was she in that respect, that even her friend, Mrs. Jones, believed that she had a small independent income, and the dreadful privation in which she had lived was not known until after her death. The surgeon had stated to the jury that the body was extremely emaciated, and, to their own view, the signs of starvation must have been strikingly apparent. The body was almost a skeleton. Who could believe that such cases as these could occur in the midst of so gorgeous and wealthy a metropolis? There must be something wrong at the sources of power. That a charitable feeling existed among the rich was undeniable. It had recently been shown in a public journal that upwards of 20,000*l.* were subscribed in London last winter for the relief of the destitute; but the starving poor had the consolation of being told that two-thirds of that sum were safely lodged in the funds! The cases of destitution were becoming frightfully prevalent, and if they occurred in such numbers in London and the county of Middlesex, to what an extent must they happen in the remote parts of the kingdom? It was evident from the letter that deceased was a well-educated woman, but it was wholly impossible for them to judge of the misery she felt when she contemplated the degraded manner in which she would be treated if she made her distresses known. That fear operated very strongly upon some minds, for a short time since he held an inquest on a poor labouring man who had cut his throat and died in a ditch, from the fear he had of being compelled to enter a poor-law Union." The Jury returned a verdict "That deceased destroyed herself by taking oxalic acid, but in what state of mind she was in at the time there was no evidence to show."—The case of Mr. Mason was made public at the inquest held by Mr. Carter, at Camberwell, on Monday. The daughter, Miss Mason, was the first witness examined: she was clad in a workhouse dress of blue stuff, over which she wore a faded black silk cloak, with an old velvet bonnet and black kid gloves, and upon being sworn burst into a flood of tears, endeavouring with the cloak to prevent her pauper garments from becoming visible. She seemed to be about 40 years of age. Upon being questioned as to her present residence, she replied with faltering and scarcely audible accents, "In the Camberwell workhouse," and a further flood of tears almost choked her utterance. On recovering herself she stated that her father was 70 years of age. He had formerly been the principal partner in the firm of Mason and Meyer, lead merchants and refiners of antimony, Hill-street, Blackfriars-road. About two years ago he had been unfortunate, and in consequence had been reduced to the greatest straits; to support themselves they were compelled to part piecemeal with every article of furniture they had saved from the wreck of their former home. When the furniture was gone, deceased and herself were compelled to remove to a furnished lodging in East-street, Walworth. They subsisted at first upon donations of friends who had known them in their prosperous days. These at length failed, and they were compelled to apply for temporary relief from the parish of St. Mary, Newington, in which they then resided. A friendly parochial order was also given to deceased for his removal to the workhouse of Camberwell, in which parish deceased had a settlement, but deceased refused to make use of it from repugnance to go into the workhouse. By the assistance of some friends they were, however, enabled to keep on their lodgings for a time. Their circumstances continued to get worse, and witness was compelled to pawn her trinkets and every article of wearing apparel, until they neither of them had more than they wore. They were obliged to quit their lodgings for a small back room in White-street, Borough, for which they paid 4*s.* a week. They both slept in the same room. Witness and deceased had occupied their last lodgings about a month. They were occasionally without food. About ten days before his death, deceased, unknown to witness, applied for relief to the parish of St. George's, Southwark. In the evening the parochial authorities sent them a portion of a quartern loaf, some tea and sugar and oatmeal. Deceased was in a very debilitated state, arising from want of food, and had ulcers on both legs. On Friday last he kept his bed and became quite insensible. They did not apply for relief to Camberwell parish, because deceased and herself were afraid of being required to go into the workhouse. It was most abhorrent to deceased's feelings, but at last they were compelled. On Thursday last he was accordingly taken in a cab to Camberwell workhouse, where he died within two hours after his admission. Mr. King, surgeon to Camberwell parish, who had made a *post mortem* examination, said death had been caused by serous apoplexy, which the want of food and proper ventilation of dwelling would sometimes cause. Deceased would have died if he had not been removed; though removal had probably accelerated it, as he was not in a proper state to bear it. The landlady stated, that when deceased took her lodgings he was in a very weak and debilitated state. They were very badly off. Witness often gave them food and firing, as much as she could afford. Deceased had no shirt, and their whole stock of

clothes was what they had on. The coroner summed up and said it was evident that if it had not been for the repugnance of deceased and his daughter to enter the workhouse, in all probability he would have been alive at this time. Verdict of Natural Death from serous apoplexy. The unfortunate lady subsequently stated that she should be most thankful if any kind individual could obtain her a situation as a governess, or some other suitable occupation, in order that she might be able to quit the workhouse, which she again stated was as repugnant to her feelings as to those of her deceased parent.

Royal Exchange.—The rental of the Royal Exchange is estimated at about 14,000*l.* per annum. The Royal Exchange Assurance Company is rented at 2400*l.*; Lloyd's at 2000*l.*; and the London Assurance at 1100*l.*

The Wellington Statue.—The final meeting of the general committee appointed for superintending the erection of the statue was held on Thursday. Mr. Masterman, M.P., treasurer of the fund, laid his accounts before the committee, and it was resolved that the trustees discharge all bills and claims upon the committee, and pay the balance to the exors. of the late Sir F. Chantrey, and that the minute-book be signed by the members and presented to the city library. It was also resolved that the trustees be requested to get the inscription immediately put upon the pedestal—viz., "Wellington," on each side, and "Erected June 18, 1844," on each end. Thanks were voted to the trustees and Officers, when the committee was dissolved.

City Improvements.—A plan is at present in contemplation in the City, to form an avenue, or colonnade, from near the end of Bartholomew-lane, Throgmorton-street, to London-wall and Finsbury-pavement South, forming a colonnade terminating near London-wall and Finsbury-circus. Though the intended alterations do not extend a very great distance, yet the various avenues pass through no fewer than six parishes, namely, St. Christopher-le-Stocks, St. Bartholomew, St. Margaret, Lothbury, St. Peter-le-Poor, St. Stephen Coleman, and Allhallows, London-wall. Application will be made to Parliament for the powers necessary to form the intended improvement, which will go through a very crowded neighbourhood.

St. George's, Hanover-square.—It is intended to take advantage of the present vacancy in the rectory of this extensive parish, and to break it up into several smaller parishes. Within the last few days two have been formed, and thus the out-wards of St. George's have been taken away from the superintendence of the rector. The parishes newly formed are those of St. Peter's, Pimlico, and St. Paul's, Knightsbridge. Of the former the Rev. T. Fuller will be the rector; and of the latter the Rev. W. J. E. Bennett, late student of Christ Church. Each of these new parishes has a handsome church, and all the means for fully and efficiently carrying out the parochial system. Other changes will take place, and no appointment to the vacant rectory of St. George's will be made until all the arrangements have been completed.

Post-Office.—It is understood that the Lords of the Treasury, in accordance with the recommendation of the Postmaster-General, have sanctioned an increase of salary, to the amount of 5*s.* a week, to 60 letter-carriers in the London District Department. This gratuity is already given to 80 letter-carriers of the longest standing, so that under the new arrangement it will be extended to 140.

Custom-House Frauds.—The discovery of another fraud has recently been made at the Custom-house. It is well known that a duty of 1*s.* 6*d.* per ounce is paid on all silver plate stamped at Goldsmiths' Hall; and that, should such plate be afterwards entered for exportation, the exporters may demand from the Customs a drawback of duty; in other words, they may claim the repayment of the 1*s.* 6*d.* an ounce paid to the Goldsmiths' Company. It appears that after the articles of plate had been stamped, they were enlarged by the fraudulent parties by the addition of silver which had not been stamped, and which had therefore not paid duty; yet when the articles were sent to the Customs for exportation, drawback of duty was claimed on the whole weight. This fraud has been carried on to a great extent in silver knife-handles, to which a large ferrule was fraudulently attached after the handles had been stamped.

Steam-boat Explosion at Blackwall.—About 5 o'clock on Tuesday afternoon a frightful and fatal accident, involving the death of seven persons, occurred on board the steam-boat Gypsey Queen, lying at one of the Blackwall buoys off the Brunswick-pier. Besides this loss of life, five persons were more or less injured, and conveyed to the London Hospital, one or two with slight hopes of recovery. It appears that the unfortunate vessel is a new iron steam-boat, of about 500 tons' burden, having two engines of 150 horse-power each. She is the first built by the firm of Jacob and Joseph Samuda, who, within the last two years, have taken premises in Bow-creek, for the purpose of carrying out their intention of building steam-boats. The engines with which she is fitted are upon a new construction, being what are called "bell-crank" engines. At 3 in the afternoon the vessel left the creek for an experimental trip, having on board about 20 persons, including Mr. Jacob Samuda, the principal of the firm. She went down the river below Woolwich, answering all the expectations of her constructors. On her return to Blackwall she was moored to one of the buoys, where it was intended she should remain all night, and be got ready for another trip the following day. In a short time after the vessel had been made fast, an explosion was heard by persons on the Brunswick-pier in the direction of the steamer, and immediately afterwards cries for boats proceeded from the same quarter. Not a moment was lost in making towards the steamer, when the most heart-rending sight presented itself. Five persons were there found, apparently in a state of madness, running about the deck, screaming with anguish. With all speed they were conveyed on shore, and met with every attention that could be afforded by the managing director of the Blackwall Railway. The agonising cries of these unfortunate persons were said to be dreadful. They begged for cold water to quell the scalding heat they were suffering in their throats, and when it was applied to the mouths of one or two, the skin from their lips peeled off as though under the influence of a searing-iron. The above five were not the only sufferers, but the others had no means of escape; they were in the engine-room, which was so filled with steam, that to get them out were impossible until the scalding vapour had escaped. In order, therefore, to facilitate their release, the decks was cut up with pick-axes, crowbars, and every sort of implement at hand. As soon as the engine-room was sufficiently clear, a descent was made, and seven persons scalded to death were there discovered, with features contorted with agony, some bleeding from the nose, ears, and mouth, and their flesh peeling from the bones at the touch. In fact, it may be said the clothing alone kept flesh and bone together. The bodies were taken ashore, and placed in one of the Railway warehouses, where six of them were shortly afterwards recognised, and proved to be Mr. Jacob Samuda, the head of the firm; Dodds, engineer; James Saunders, also an engineer, appointed to the Gypsy Queen, and who only went on board a few hours before he lost his life; Mr. Scofield, engine-fitter at the factory of Messrs. Samuda; Thomas Nugent, an apprentice; John Newman, stoker; and a man whose name is not yet known, having been employed only a few hours by the firm. Those who were taken to the hospital are—Mr. W. Ryley, foreman to Messrs. Samuda; a boiler-maker, and three stokers. The inquest was held on Tuesday, at which several witnesses were examined. The most important evidence was that of Mr. Low, the engineer, who stated that the pressure of steam lifted the pipe out of the socket of the cylinder, although it was guarded, and caned in, in the usual way with the gasket and hemp. How that could be effected puzzled many, but on the pipe being examined, it was found that it had no beading or flange to resist the force; the consequence was, that as soon as the steam had increased after the vessel was moored on her return, the pressure was too great for the joint, and its immediate displacing was the result. After a long sitting the inquiry was adjourned to yesterday, when the jury returned a verdict of Accidental Death.

Wesleyan Missions.—On Monday evening a meeting of the friends of Wesleyan missions was held at the Wesleyan Chapel, Southwark, Alderman Challis in the chair. It was stated that misrepresentations of a serious nature had within the last few days been made with respect to the missions in the *Times*, by a person who was formerly engaged by the Wesleyans, but had been been discharged, and that Mr. T. B. Freeman, a missionary from the Gold Coast, was present for the purpose of showing their want of foundation. Alderman Challis opened the business of the evening by giving a brief outline of the missionary enterprise in which the Wesleyans had long been successfully engaged, and referred especially to the proceedings of the last 50 years. The Alderman concluded by urging on the meeting the necessity of renewed exertions. Several resolutions having been passed, Mr. Freeman addressed the meeting at considerable length. He spoke of the state of Africa in times past, contrasting it with its present condition. Although numerous obstacles still stood in the way of missionary exertions, yet much had been done, and their prospects were daily brightening. Religious instruction was extensively diffused, and the influence exercised on the minds of the powerful chieftains was extraordinary. Even haughty kings took the humble missionary by the hand, and invited him as a friend to the royal palace. Several chiefs had been converted through the instrumentality of the missionaries. Mr. Freeman proceeded to show that success was certain, and defended the missionaries against the aspersions that had been cast upon them.

The Scottish Hospital.—On Monday a special court of the governors of this Corporation was held, for the purpose of considering the propriety of removing the hall from Crane-court, Fleet-street, which premises have been in the possession of the Corporation since 1665, when it received its first charter from Charles II. Professor Donaldson stated that a committee had been appointed to consider the expediency of the removal of the hall; but they were unwilling to take any measures without the consent of the Court. They had ascertained, however, that there were several sites now vacant in the new line of street from Holborn to Long Acre, and that the fee-simple could be obtained from the Woods and Forests. The Fleet Prison had also been suggested. A long conversation ensued upon the propriety of removing, when Mr. Noble moved a resolution, "That it was necessary, for many reasons, to remove the offices of the corporation to another site, and to have a new hall in some eligible and conspicuous situation." Mr. Morris seconded the resolution, observing that it would be for the benefit of the Institution. It was now in an obscure situation, and he had known many noblemen complain of the difficulties they have met with in trying to find the hall. Several governors expressed a wish to know the expenses likely to be incurred in the sale of the estate at Crane-court, upon which an amendment was agreed to:—"That the committee continue their inquiry into the propriety of removing the Scottish Hall from its present situation, and report to a future Court.

Suicide of a Sergeant-at-Law.—A rumour was current throughout Friday and Saturday last at Westminster Hall, that Mr. Sergeant Andrews had made an attempt at self-destruction, which unfortunately proves but too true. It appears that the learned Sergeant had been for some time past depressed in spirits, and had passed most of his time in his library. On Thursday he seemed unusually depressed, and after breakfast had retired to the library, where, in the course of the morning, Mrs. Andrews was horror-struck at beholding him deluged in blood. A surgeon was immediately sent for, and rendered every assistance which the emergency of the case required. The unfortunate gentleman lingered until Wednesday morning, when he expired at his residence at Hampstead. He was in his 73d year, was the senior sergeant-at-law, and held his appointment by virtue of a patent granted in the reign of George III. The learned gentleman, it is stated, had lately been exceedingly melancholy, more particularly since the appointment of Mr. Sergeant Adams to the newly-created Assistant-Judgeship. He had frequently adverted to that subject, and appeared, it is stated, to think that he himself had some prior claims to the appointment.

The Polish Ball.—Lord D. Stuart has obtained permission from the Corporation to hold another ball and concert at Guildhall for the benefit of the Polish Refugees. The day fixed for the festival is the 19th inst., and it is said that it will take place under the patronage of the Duchess of Kent, the Duke and Duchess of Sutherland, Lord and Lady Wharncliffe, Lord and Lady Stanley, Lord and Lady J. Russell, and Sir R. and Lady Sale.

Late Hours of Business.—A numerous meeting of persons engaged in the various branches of the wholesale drapery trade was held on Wednesday night, for the purpose of taking into consideration the propriety of discontinuing business at an earlier hour on every Saturday than that at which warehouses close under the existing system. A resolution was proposed, expressing the opinion of the meeting, that a restriction of the hours of occupation in drapery warehouses on Saturday evenings would be highly advantageous to those employed in them. The resolution was carried unanimously, with another, that as the system of restricting hours of occupation in wholesale drapery warehouses succeeded so well in Manchester, it ought to be adopted in London.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Nov. 9; West Districts, 159; Northern, 175; Central, 152; Eastern, 218; Southern, 285; Total, 989. Weekly average for the last five years, 946.

Provincial News.

Bedford.—The *Bedford Mercury* has the following paragraph:—"The Duke of Bedford has ordered his tenants to deal with rabbits as rats, and clear their farms of these destructive animals, which only go to gamekeepers, who take care to pursue rabbit poachers, to preserve their privileges at the cost of the farmer."

Birmingham.—The firm of Messrs. Joseph and Charles Sturge, corn-factors in this town, have adopted the resolution not to sell barley for malting. In a letter to a friend on the subject, Mr. Joseph Sturge states why this course has been taken. "Intemperance," he says, "produces such an incalculable amount of vice and misery, that I consider it right to use my influence to promote the principles of total abstinence. This I feel the more bound to do, as nearly 20 years' personal experience, and much observation in this and other parts of the world, have convinced me that fermented liquors are not necessary to health, and that those who refrain even from what is termed the moderate use of them, are in consequence capable of more bodily and mental exertion, and exempt from many maladies which afflict others. In accordance with these views, our firm has long altogether declined the sale of malt, or the supply of any grain to distilleries, and converted to other uses cellars which many years ago we let to wine and spirit merchants. Our continuing to take commissions for the sale and purchase of barley for the purpose of malting has for some years caused me much uneasiness; and I have recently been so fully convinced that it is wrong to do so, that I must have withdrawn from our concern had it not been relinquished. The belief that we are responsible for the means of acquiring, as well as for the use we make of our property, and that we cannot exercise too rigid watchfulness over our own conduct, is compatible with perfect charity towards those who differ from us in opinion."

Cambridge.—During the reading of a Paper on Architectural Drawing considered as the handmaid to the study of Ecclesiology, at a meeting of the Cambridge Camden Society, on Thursday last, Mr. Wordsworth, the poet, who is also an honorary member of the Society, entered the room on the arm of the Master of Trinity, with whom he is at present on a visit. Immediately all the members rose, and remained standing until the president, Archdeacon Thorpe, who had also risen to receive him, conducted the venerable Laureat to a seat, and resumed the chair. The reading of the Paper was then continued; and the President having subsequently adverted to the presence of their distinguished honorary member, said that he was one of the founders of the Society, and had sown the seed which was branching out now among them, as in other directions, to the recall of whatever was pure and imaginative, whatever was not merely utilitarian, to the service of both church and state.

Carmarthen.—The local papers announce that the health of their gallant townsman, Sir William Nott, has so

far improved as to allow of his being out again. He has twice this week taken a carriage airing.

Derby.—An inquest has been held upon the bodies of the persons killed by the accident at the Mill Fleam in the Morledge, as noticed in our last. Evidence was given at great length, which tended to show that the work was well executed and the materials good, and that had there been two sets of centres instead of one, so that the arch might have had more time to set before they were removed, the accident would probably not have occurred. The Jury returned a verdict of Accidental Death, with a deodand of 1*s.* upon the centre of the arch, and a recommendation that in future all such works should be carried on with not less than two centres.

Knutsford.—On the 5th inst. the coroner for this division of Cheshire, held an inquest at Monk's Coppenhall, on the body of Richard Gallop, carpenter, in the employ of the Grand Junction Company, who was suspected to have come to his death by foul means. His daughter, Mary Gallop, was in custody charged with having administered to him poison. A lengthened investigation took place, in which evidence was adduced of the prisoner having purchased poison, and that she had also mixed it with the food of deceased. The jury returned a verdict of "Wilful Murder against Mary Gallop," and she was committed on the coroner's warrant to Chester Castle, for trial at the next assizes. During the whole proceedings she manifested no emotion either for the loss of her father or at her own position in the affair. It appears that deceased had amassed about 400*l.*, and it is supposed that the daughter wished to bestow it, with herself, upon a young man to whom she was much attached. She seems to have been administering the poisonous ingredients for three weeks past.

Liverpool.—The Birkenhead Dock Company have given notice to the corporation of Liverpool that it is their intention to pay cash for the property purchased by them at Wallasea Pool, taking up the leases forthwith, instead of accepting the stipulated credit. The amount is said to be about 300,000*l.*—Another collision on the Mersey took place on Sunday night, during the severe storm which prevailed in the Channel. The brig Blundell, of this port, bound to Trinidad, came in contact with the American ship Feronia, and almost immediately went down, head foremost. No lives were lost.

Manchester.—The first conviction of a millowner, in a penalty for injuries received by a party in a mill, owing to the machinery being left in an insecure state, took place on Saturday, at the Borough Court, in this town. Considerable interest attached to the case, in consequence of the question raised being, Whether a person not a worker in a cotton-mill could receive compensation for injuries received from unprotected machinery? The mother and brother of the injured girl were power-loom weavers employed in Mr. Waddington's mill, and the girl, who is 12 years old, was in the habit of coming to the mill every afternoon with her mother's and brother's tea. On the 8th October, the girl came as usual, and shortly afterwards was heard to utter a piercing scream, and was observed to be fast bound by her clothes to an upright shaft, and turning round at a frightful rate. Some time elapsed before she was released, and not before she had received severe injuries about her head and face. A solicitor took an objection to the proceeding, on the alleged ground that the clause of the act under which it was taken was applicable only to persons employed in the mill. The magistrate said, the opinion of the bench was, that there ought to be a conviction with a penalty of 20*l.*, and it was to be understood that such was the decision of the court; but he would consider the law more narrowly, and announce the result in a few days.

Newcastle-on-Tyne.—A serious encounter took place on Thursday night between a party of watchers and some poachers on Lord Ravensworth's estate, about three miles from this town, in which two of the keepers were severely wounded, and now lie in a precarious state. The keepers were on the watch, and challenged two men who made their appearance in Hagg's Wood, when the poachers fired, wounding both men, who were distant only a few yards. The police are scouring the district, endeavouring to find out the poachers, who are supposed to be pitmen; but there is little chance of their succeeding, for the night was so dark that it would be impossible to identify them.

Oxford.—The Rev. Isaac Williams has addressed the following letter to the *Times*. "I understand that it is stated in the *Morning Chronicle* and other papers, that a letter has been received by me from the Rev. J. H. Newman, intimating that he can no longer continue a member of the English Church. This is a simple falsehood. I have had no letter, and no intimation of the kind whatever."

Plymouth.—A few weeks since, sentence of death was passed by a Court-martial upon a man named Barnes, late carpenter's mate of Her Majesty's ship Resistance, for striking the boatswain of that ship. This sentence has now been commuted to two years' imprisonment; and another Court-martial has been held upon the boatswain, who has been dismissed the service for provoking the other man to strike him.—On Friday morning a fire broke out at the extensive tan-yard at the top of Tavistock-street, belonging to Messrs. Tanner, of Sherwell-house. It raged with uncontrollable fury for some time, and was not got under until property to the amount of between 5000*l.* and 6000*l.* was consumed, including the destruction of the tan-yard, buildings, bark, wool, and a large quantity of leather. One man, who was actively assisting in its suppression, is supposed to have fallen into the burning mass of tan, and there perished. The public authorities, naval, military, and local, made great efforts to save the property, and a plentiful supply of water to all the engines of the neighbourhood no doubt much circumscribed its ravages. The fire at first was supposed to have originated spontaneously from the undisturbed deposit of tan, but later reports ascribe it to an act of incendiarism. It was on that day week the saw-mills were burnt in the Borough. A Chartist lecturer has been visiting this part of the country, descanting on the evils of machinery, and the unequal distribution of property.—On Sunday an immense quantity of snow fell in the neighbourhood of Dartmoor; and on Monday, Dartmoor itself was found covered with snow to the depth of more than six inches. The weather throughout Devonshire has been extremely rough for several days past.

Southampton.—The Eleanor, from Fayal, arrived at this port on Saturday, in 11 days, and discharged her cargo of 950 boxes of oranges at Southampton on the same evening. This is the first arrival of the season, and the oranges were immediately despatched by the Southampton railway to London, and had not Sunday intervened, the brokers, Messrs. Keeling and Hunt, to whom the management and sale have been intrusted, would have been selling them in London 24 hours after they had been landed at Southampton. Every facility was afforded by the Customs in expediting the unloading of the cargo; and the railway directors were so impressed with the importance of the result, that special engines were ordered to be applied, if found necessary, to increase the speed to London; and the experiment being attended with the best success, will no doubt be productive of much increased business to the port of Southampton. In hazy or bad weather, ships are sometimes 9 or 10 days in beating round to London, which, with perishable cargoes, is often attended with loss. By discharging at Southampton the vessels now save all this detention and risk, and are able to make three voyages where only two have been previously accomplished.

Warwick.—In consequence of the recent outrage at Mr. Worthington's, at Mancetter, (noticed in our Paper of the 26th ult.), Mr. Dugdale, M.P., convened a meeting of magistrates, when it was unanimously agreed that a communication should be forwarded to the Secretary of State for the Home Department, signed by all the magistrates, soliciting the Government to offer a reward of an additional 100*l.*, with Her Majesty's free pardon to either of the parties who will impeach his accomplices. A letter from Sir J. Graham to Mr. Dugdale was received on Thursday last, granting the request of the magistrates, and offering a reward of 100*l.*, in addition to the 100*l.* previously offered by Mr. Worthington, for the discovery and conviction of the burglars.

Yarmouth.—A Government agent has recently been at Yarmouth inspecting various localities for a lunatic asylum for both officers and privates in the army. It is said that the Royal Naval Hospital has been selected for that purpose, and that 60 or 70 persons will shortly be inmates of that fine building.

York.—The local papers state that last week, at the Howden Horse Fair, the greatest, perhaps, in England, among those present there was a buyer from the Emperor of China, in the person of one of his subjects, attended by an interpreter.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2287*l.*; Bristol and Gloucester, 944*l.*; Eastern Counties, 4324*l.*; Edinburgh and Glasgow, 2217*l.*; Great Western, 15,320*l.*; Grand Junction, 7744*l.*; Glasgow, Paisley, and Ayr, 1468*l.*; Great North of England, 1862*l.*; London and Birmingham, 16 074*l.*; South Western, 5892*l.*; Greenwich, 797*l.*; Blackwall, 776*l.*; Brighton, 4789*l.*; Croydon, 382*l.*; Liverpool and Manchester, 4586*l.*; Manchester, Leeds, and Hull associated, 6502*l.*; Midland, 9861*l.*; Manchester and Birmingham, 3123*l.*; Newcastle and Carlisle, 1975*l.*; Newcastle and Darlington, 1177*l.*; Preston and Wyre, 310*l.*; South-Eastern and Dover, 4742*l.*; Sheffield and Manchester, 632*l.*; York and North Midland, with Leeds and Selby, 2326*l.*—The two meetings, decisive of the treaty between the Manchester and Birmingham and Sheffield, Ashton, and Manchester Companies, were held last week. The Sheffield, Ashton, and Manchester Company met on Monday, Mr. Parker, M.P. for Sheffield in the chair; and after a discussion as to an alleged insufficiency of notice, and the necessity of adjournment in consequence of the crowded state of the room, the chairman in a long address set forth the advantages which would result from the treaty, and concluded by moving—"That this meeting consider it expedient to authorise, and hereby authorise, a lease to be granted to the Midland and Manchester and Birmingham Railway Companies of the line and works of the Sheffield, Ashton-under-Line, and Manchester Railway Company, for a term of 30 years." After a lengthy discussion, Mr. Roberts, of Chester, moved as an amendment, "That this meeting do adjourn." The original motion was, however, carried by acclamation. The meeting of the Manchester and Birmingham Company was held on Wednesday, when the following resolution was passed:—"That it is expedient to authorise this Company, in conjunction with the Midland Railway Company, to accept a lease from the Sheffield, Ashton-under-Line, and Manchester Company of their line and works, with all the stations, tolls, emoluments, and other property thereof, for a term of 30 years, to commence on the expiration of six months from the opening of the said line throughout, and determinable by either party at the end of the first 10 or 20 years, on 3 years' previous notice." It appears that the lessees are to pay all interest on loans not exceeding 700,000*l.*, and all the liabilities of the Company, adopting at the same time the Company's guarantees to other undertakings. The rent will be variable, the *minimum* being 5 per cent.—It is rumoured that the Liverpool and Manchester Company have purchased the North Union, and that the Grand Junction and the Liverpool and Manchester Companies have agreed to amalgamate. Such an arrangement, if effected, will affect various local lines, and prevent the laying down of others in contemplation.—The South Eastern and Dover Company held a special meeting last week, for the purpose of considering the expediency of capitalising the mortgage debts of the Company by the creation of new shares, to provide funds for the formation of the Canterbury, Ramsgate, and Margate lines, and for other purposes. It was stated that among the various measures contemplated by the directors was a project for shortening the line between London and Dover to the extent of 12 miles. It was resolved to capitalise the mortgage debt of the concern, the sum required to be raised for this purpose being 1,400,000*l.* An issue of 42,000 new shares will be made to effect this object, at the rate of 33*l.* 6*s.* 8*d.* for each 50*l.* share. It is stated, that though the issuing of these new shares at a discount of 16*l.* 13*s.* 4*d.* may appear great, it is a sacrifice less in amount than has been suffered in previous issues. Of the ultimate prospects of the Company a highly favourable account was given at the meeting.—An adjourned meeting of the West London Company was held last week. The chairman said that the negotiations with the London and Birmingham Company, for the lease or purchase of their line, had been unsuccessful, and that most of the directors had sent in their resignations. He recommended the formation of a new direction, and the adoption of measures for extending the line to the Thames, as the only means of making it profitable. Lord Kensington warmly opposed this plan, and said that the railway was already a most unprofitable concern, without any attempts to extend it further. After an angry and personal discussion, it was resolved to appoint a new direction, and to apply to Parliament for power to extend the line to Knightsbridge and the Thames.—At a meeting of persons interested in the South Wales Railway at Cardiff, on Friday, Mr. Brunel stated that the Box Tunnel of the Great Western Railway cost 100*l.* per yard; the White Ball Tunnel on the Exeter Railway cost 53*l.*; the Cheltenham tunnel, in connection with the Great Western Railway, was estimated at 136*l.* per yard, and it cost but 54*l.* per yard; and to show the reduction in this department alone, he mentioned that within the last three weeks he had contracted for tunnelling at 28*l.* per yard.—A meeting of the landowners of North Essex was held on Monday for the purpose of considering the propriety of forming a railway from the Eastern Counties line to Sudbury. At a previous meeting it had been proposed to join the line at Kelvedon, but it was now moved, in consequence of the desire of the inhabitants of Witham to have a branch to Braintree, that the Sudbury Railway should join the line from Braintree to Witham, at which place it would of course fall into the Eastern Counties. This resolution was unanimously adopted, and it was stated that the railway will eventually be carried to Halsted.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association was held on Monday, Capt. Broderick in the chair. Mr. Ray, who has been absent for some time, having made his appearance, was greeted with a round of applause. The Secretary returned thanks for this token of regard, and said that he had had a delightful sojourn in the wild mountains of Derrynane, and had left the Liberator in excellent health and spirits. During his absence he had acted as a Repeal missionary in a small way, and would take this opportunity to give an account of his mission. He then read a sort of report on the state of the Repeal cause in the different towns he had visited, including Kildare, Kilkenny, Clonmel, Cork, Limerick, and other places. He represented the state of the movement as very propitious in all these localities; the organisation complete, the Repeal wardens most active, reading-rooms and other conveniences for carrying on the agitation. Mr. Ray, having concluded reading this report, said that during his tour he had been most forcibly struck by the beauty and magnificence of the country, and the extreme misery of the people—their hovels, rags, scantiness of food, &c. He then announced that he had two letters to read from the Liberator, the first of which referred to a remittance of 500*l.* from New York; the second announced that Mr. O'Connell would attend the meeting on the 25th, to submit two topics which he considered of vital importance. "The first," says Mr. O'Connell, "involves the subject of an application to Parliament for an impeachment of the persons principally concerned in the late monster persecutions, and in particular to consider deliberately the propriety of addressing the people of Great Britain, in order to procure their aid in enforcing on Parliament the necessity of such an impeachment. If such an address shall be agreed upon, it will remain to be determined whether it shall take place by personal attendance in England of a delegation of the Association, or through the medium of the press. The second great object for the consideration of the Association on the 25th is one which has engrossed much of my thoughts, and from which my mind is full of the anticipations of great utility, if it can be legally arranged—I mean the appointment of a Preservative Society of Three Hundred." Mr. O'Connell then adverts to the question of Federalism, and says—

"It is also ascertained that if the Repealers should find the plan of Federalism is one by which Ireland could get all that

Simple Repeal could give her, *and something more*, that in such case the Federalists will be permitted, and even solicited, to take their natural station, according to their talent, wealth, and rank, at the head of the movement. I think it right to express my very strong opinion that we should have had a very powerful Federal demonstration, if the English Whig party had not succeeded in stifling it for the present. There is something exceedingly ludicrous in the fact, that, whilst the English Tory press were abusing the Whigs, and abusing me for having, as they untruly alleged, entered into a compact to substitute Federalism for Repeal, and to assist in bringing the Whigs again into office, the Whigs were, at that very time, counteracting every effort of mine to procure a declaration from the Federalists, and they actually succeeded in preventing a Federal declaration—which, I believe, would have long since appeared but for their antagonist exertions. There is one inquiry," he continues, "which the people of Ireland have a right to make, and which I am ready to answer. What occasion has there been to raise the question of Federalism, I, myself, being content with the restoration of the Irish Parliament in a reformed shape? My answer is—that it is a duty which I owe to the people of Ireland, to obtain for the struggle for the restoration of their Parliament all the strength, power, and energy that I possibly can accumulate in that cause; it is my sacred duty to show to the British empire, and to the world, upon what slender foundations of support the Union statute is based: to demonstrate to the British Ministry and British Parliament, the universality of the disgust that pervades Irishmen of every class, at being deprived of any share in the government of their own country. I demonstrated by means of the monster meetings of last year how intense was, and is, the anger of the Irish people at the loss of their national independence, and how peacefully, but fixedly determined they were, and are, never to relax their exertions until the Parliament shall be in College-green again; and now it is equally incumbent on me to procure, if possible, a similar combination among the wealthier classes, and particularly among the Protestant nobility and gentry, for the restoration of our national independence. There is no taunt—there is no reproach—there is no calumny, that I am not cheerfully ready to endure, if I am able to procure the support of such of the Protestant nobility and gentry as have not yet joined us in seeking the Repeal of the Union statute. There is nothing short of principle which I would not sacrifice to obtain the support of the Protestant gentry: I desire to place them at the head of the movement, that all fear of religious ascendancy may be done away with for ever, and the Repeal of the Union rendered secure."

In conclusion he says,—

"I have thus shown that I seek for Ireland the full benefit of the Repeal of the Union, and the restoration of her domestic Parliament; that I will never take less for the Irish Parliament than that which it had before the Union, that is, final legislative and judicial authority in Ireland. But, if I can get more for Ireland—if I can, in addition to her legislative independence, procure for her, by means of a Federal arrangement, a direct interference as to foreign treaties, and a direct and unequivocal power in colonial affairs, I will not refuse the advantages and authority which may be tendered to Ireland, as additional links in the connection with Great Britain. In fine, fellow-countrymen, the pause of experiment is over; let us rouse again for the peaceful contest—a contest not to be suspended until the Parliament is again in College-green with all its ancient authority and jurisdiction."

Mr. Ray then read a letter from Mr. Joseph Sturge, and an address to the Irish people from the Birmingham Council of the Complete Suffrage Union. Their proposal was to recommend Universal Suffrage. Mr. M. O'Connell then handed in the bill of exchange for 500*l.* from New York, and read the letter containing that remittance. It stated that this sum of 500*l.* was the first instalment of the 2000*l.* which the Repealers of New York had pledged themselves to supply in liquidation of the fine imposed on Mr. O'Connell; but, as that fine was no longer to be paid, they still intended to raise the amount of it, to be applied to the general purposes of the Association. Mr. O'Connell congratulated the Association on the feeling which prevailed throughout America in their favour. This remittance proved that the hostility entertained towards the Irish in the States was confined to a single spot—Philadelphia; but that everywhere else throughout the Union there was an unbounded sympathy with the repeal cause of Ireland. Several contributions were handed in by different gentlemen, after which Mr. M. O'Connell rose to controvert some remarks having a tendency to palliate the murders which had been perpetrated in the south of Ireland, and dwelt on the folly and infatuation of committing such enormities, which he asserted called aloud to Heaven for vengeance. It was received as a political axiom amongst Irishmen, that "the man who committed a crime gave strength to the enemy," and he could, therefore, have no hesitation in branding as a traitor the wretches who would be guilty of such enormities as he had alluded to. Mr. Dohenny having handed in a sum of money from the county of Tipperary, urged the union of all parties for the benefit of their common country, and denied that the Catholics ever aimed at obtaining an ascendancy. After some routine business had been disposed of, Mr. M. O'Connell announced the rent for the week to be 838*l.* 16*s.* 3*d.*—Mr. Sharman Crawford has published a long letter in the Dublin papers on the present state of Ireland, showing the practical evils which have arisen from the existing state of the connection between the two countries, and promising to state in a future letter what changes he considers necessary to remedy them.—The Duke of Leinster has presided at a meeting in Dublin, whence has emanated a resolution to raise a sum of 20,000*l.* for Father Mathew.

Limerick.—On Monday week, the day on which Mr. Gloster was murdered, Mr. Robert Hunt, of this city, was fired at, at noon-day, near Smithfield-gate, Croagh, by an armed party, one of whom covered him as he drove along in his gig, but Mr. Hunt's servant drew out a pistol, which he pointed towards the cover, and this made the fellow's hand shake, for he fired wide, and providentially missed his object. The miscreants then jumped out on the road to follow their intended victim, but, seeing Mr. Hunt and his servant too well prepared for them, they desisted. In regard to Mr. Gloster's murder, the local papers state that, as the remains passed along the road from Kilkishen, in a funeral coach, the peasantry in the fields turned off from their work of potato-digging to cheer and exult at his death. Mr. Gloster's landed property was about 900*l.* a year. He was an extensive grazier and dairy farmer; was unmarried, and, in the event of a sister who lived with him dying unmarried, the reversion of his property goes to the trustees of the Episcopal Asylum Chapel of this city. A meeting of magistrates has been called in consequence of this outrage, and several witnesses examined, but no clue has been obtained to the murderer.—On Sunday last another murder was committed, the land-steward of the unfortunate Mr. Gloster having been waylaid and murdered on that evening, near Kilkishen.

Miscellaneous.

Extraordinary Discovery.—In the excavations for the improvement of the Caledonian Canal (now in rapid progress throughout the whole line) a curious circumstance was observed at Bona, where the small lake of Dochfour is joined by a narrow neck of land to Loch Ness. This spot was once the scene of a Roman encampment, and, according to Chalmers, was called the British Boness, that is, the foot, or lower end of Loch Ness, which the Romans Latinised into Bonessia, and Ptolemy into Banatia. Near the ramparts of this Roman camp was a rude keep or fortress, called Castle Spiritual, designed, we suppose, to command the passage of the river Ness. In removing some of the ruins of the castle a number of human bones, the teeth being remarkably fresh and entire, and one complete skeleton, were found. Some coins of the reign of Elizabeth were also dug up; but what occasioned most surprise was the discovery of a nest of toads, completely encased in the solid wall, with apparently not the slightest opening by which ingress could be obtained. In a small cavity, about 3 inches in diameter, were found six toads and a lizard. On their first admission to the light of day the toads appeared insensible, but on being touched by the men they speedily revived.—*Caledonian Mercury.*

The Norwegian Traveller.—The German Papers have recently announced that Mensen Ernst, the celebrated Norwegian pedestrian traveller, had died on a journey in seeking for the sources of the Nile, and was buried near the cataracts. It appears, however, that he is come to life again. According to the Journal of Aix-la-Chapelle, he has lately been in India, having performed the journey from Constantinople to Calcutta and back, on foot, in fifty days.

Hydrophobia.—The *Frankfort Gazette* says:—"A gentleman of Saratoff has discovered that the most efficacious remedy for the bite of rabid animals is the insect called *tentania aurata*, reduced to powder, and given to the patient. Dr. Wagner has tested the remedy, and met with most satisfactory results."

Law.

Vice-Chancellor's Court.—(Before the Vice-Chancellor of England.)—*Huxtable* v. *the State of Illinois and Others.*—The State of Illinois is one of the repudiating American States, upon which fact the interest in this suit depended. Mrs. Huxtable, the plaintiff, was induced by Messrs. Wright, her bankers, in 1840, to sell out some foreign stock, and to invest the proceeds in the purchase of debentures in the Illinois and Michigan Canal. Messrs. Wright were then the agents of the State of Illinois, and had the disposal of the bonds. Among the other irregularities of Mr. Wright, the principal partner in the firm, it was alleged that he had not pursued his authority in the issue of the bonds, and some of the disputed bonds he gave to Mrs. Huxtable. At their bankruptcy the firm was largely indebted to the State, one of the items in the amount being the money which Mrs. Huxtable paid for the bonds, and the State proved for the balance. The notorious event of the repudiation of their debts by the State of Illinois and other States subsequently occurred. The agents of the State at the time of the repudiation were Magniac, Smith, and Co., and afterwards Magniac, Jardine, and Co., and the present agents are Baring, Brothers, and Co. All these persons were also made defendants to the bill, together with the assignees of Messrs. Wright, who held the dividends upon the proof against that firm. The Illinois and Michigan Canal having been stopped up for want of funds, in consequence of the repudiation, an attempt is now about to be made by the State, through Messrs. Baring and Co., to raise a further loan in this country from the original bondholders, upon a promise of certain advantages. Under these circumstances, which were detailed in the bill in a very complicated manner, this bill was filed, alleging that the only property which the State had in this country was the dividends upon the proof against Mr. Wright's estate, and praying for an injunction to restrain the payment to the State of the dividends, and to restrain the further negotiation for the loan to the canal project until the plaintiff's claims should be recognised and satisfied. To this bill several demurrers were filed. His Honour said there might be a very good case, for aught he knew, against the assignees of Wright, and against the State of Illinois. But it was to be collected from the bill that the State had an objection to the manner in which the bonds were dealt with. And if the State did repudiate, in the sense intended by that word, the bonds in the way they did, it was not to be said that they did so without justice. It was too much to say that the State acted dishonestly because they refused to sanction a transaction which they had not authorised. But the question was, Whether the plaintiff had made out a case against the demurring parties? His Honour then proceeded to analyse the allegations of the bill regarding these defendants, but the contents were not in the least interesting, and his Honour concluded that as equity was not shown against any of the demurring parties, he therefore allowed the demurrer, with liberty to amend. He thought there was a substratum of a good case, but he could not undertake to say positively that there was.

Theatricals.

Drury-Lane Theatre.—On Monday night this theatre was honoured with the presence of Her Majesty and Prince Albert. The royal party occupied a private box on the tier above the dress circle in the bend of the house. Although the visit was a private one, it was Her Majesty's first appearance in public since the opening of the Exchange, and consequently it did not pass unnoticed by the audience. At the moment of her appearance, which was at the beginning of the second act of the *Syren*, applause broke forth from all parts of the house, and a call was raised for the royal anthem. It was, however, unnoticed on the stage, and for some time the opera was continued amidst a deafening mixture of hisses, applause, and cries for "God save the Queen." At last, however, the drop was let down, and soon after raised with the whole company assembled to sing the anthem, both before and after which the Queen bowed repeatedly to the audience. The second act of the opera was then commenced again. Both Her Majesty and Prince Albert appeared in excellent health and spirits, and nothing could be more gratifying than the general exhibition of loyal feeling towards them on the part of the multitude which filled the house.—The hundredth performance of Mr. Balfe's *Bohemian Girl* took place at this theatre on Tuesday night, the composer himself presiding in the orchestra. Upon Mr. Balfe's entrance the greeting was long, loud, and universal. At the end of each act he received the spontaneous applause of the audience, and at the close of the opera he was summoned before the curtain, when a laurel wreath was cast upon the stage and presented to him by Miss Rainforth.

BIRTHS.—On the 4th inst., at Roehampton, the lady of D. B. Chapman, Esq., of a daughter—At Minterne-house, Dorset, Lady T. Digby, of a daughter—6th inst., at Waltham Cross, Herts, the lady of A. Jearrad, Esq., of a son—6th inst., at Gillingoase, near Falmouth, the lady of T. M. Horsford, Esq., of Lincoln's Inn, barrister-at-law, of a daughter—7th inst., at Salters'-hall, St. Swithin's-lane, Mrs. E. Thomson, of a daughter—7th inst., at Hanover-terrace, Peckham, the lady of A. Johnson, Esq., of a daughter—7th inst., at Thornton Watlass, the lady of the Rev. R. Courtenay, of a son—8th inst., at Brighton, the Right Hon. Lady Headley, of a daughter.—13th inst., at High Wycombe, Bucks, Mrs. R. Wheeler, of a son—5th Nov., at Pisa, Italy, the lady of A. H. Lowe, Esq., eldest son of A. Lowe, Esq., of Highfield-house, Nottingham, of a daughter.

MARRIAGES.—On the 30th ult., W. Daniell, Esq., surgeon, Nayland, to Emma Tiffen, youngest daughter of T. L. Tiffen, Esq., of Elm Cottage, Great Cornard, Suffolk—7th inst., at Bow Church, H. Walker, Esq., to Harriet S. Burnet, only daughter of J. Burnet, Esq., of Egmont-house, Kensington—7th inst., at Cheveley, J. Fairlie, Esq., of Cheveley Park, to Mary Isaacson, eldest daughter of W. P. Isaacson, Esq., of Newmarket—7th inst., at St. Peter's, Dublin, J. Tuffnell, Esq., 3d Dragoon Guards, younger son of the late Colonel Tuffnell, of Bath, to Henrietta Fannin, relict of the late R. Fannin, Esq., of Dublin, and only daughter of C. Molony, Esq., county of Clare.

DEATHS.—In September last, at Soorapoor, in the East Indies, Mary Taylor, the wife of Captain Meadows Taylor, of His Highness the Nizam's service—1st inst., at Mount Ballan, near Chepstow, Caroline Williams, wife of Major-Gen. Sir E. Keynton Williams, K.C.B., and daughter of the late J. Hawker, Esq., of Plymouth—4th inst., at his residence, Clapham, J. Hannay, Esq., aged 76—6th inst., suddenly, after a long and painful illness, Lieut. M. R. Dyett, R.N., second son of the late H. Dyett, Esq., of Guildford-street—9th inst., in Ormond-row, Richmond, Surrey, Mrs. Hofland, well known from her many moral and instructive writings, aged 74.

THE HAIR.—Of the numerous compounds constantly announced for promoting the growth, or reproduction of the Hair, few survive, even in name, beyond a very limited period, whilst

ROWLAND'S MACASSAR OIL,

with a reputation unparalleled, is still on the increase in public estimation. The singular virtues of this successful invention for Restoring, Preserving, and Beautifying the Human Hair, are too well known and appreciated to need comment. The very facts of the high and distinguished patronage it enjoys, its general use in all countries, together with numerous testimonials constantly received in its favour, are authorities which stamp its superior excellence and title over all attempts of a similar nature. Being universally preferred, its consequent great demand excites the cupidity of unprincipled shopkeepers, who vend the most spurious trash as the "genuine" Macassar Oil: whereas, the genuine article is wholly the invention and property of A. Rowland and Son, and the amalgamation of its costly exotic materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "Macassar Oil." The genuine article has the words

ROWLAND'S MACASSAR OIL,

engraved in two lines on the wrapper; and on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per Bottle. Sold by the Proprietors at 20, Hatton Garden, and by Chemists and Perfumers.

*** All other Articles sold under the same name are FRAUDULENT COUNTERFEITS.

WANTED A FOREMAN.—He must have a practical knowledge of the business in every department, and be thoroughly acquainted with the Propagation and Management of Hardy Shrubs and Fruit-trees.—Direct, stating terms, and reference as to character and ability, to Mr. Glendinning, Chiswick Nursery, near London.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A respectable young Man, aged 28, is desirous of obtaining a situation as Head-Gardener. He has a thorough practical knowledge of the profession in all its branches, and for the last three years has acted as one of the foremen at Bicton, Devon, under Mr. J. Barnes, where he has had an opportunity of seeing every department of the business most successfully carried out, and conducted on the most improved principles. Can be well recommended for sobriety and general good conduct.—Direct to J. S., at Messrs. Veitch's Nursery, Exeter.

AS FOREMAN and PROPAGATOR in a NURSERY.—A Man who perfectly understands his business, connected with the above. Unexceptionable reference will be given.—Direct to J. R., 22, Montpelier-row, Brompton.

AS GARDENER.—A married Man without a family, aged 35, who has a thorough knowledge of his business in all its various branches; can have an excellent character from his last situation. No single-handed place accepted.—Direct to A. B., Hogg's Library, 25, Edgeware-road.

AS GARDENER.—A married Man, of steady, sober habits, who is qualified to fill a confidential situation as good Gardener, well understanding his business, and can have a most undeniable character from his last employer. Does not object to a single-handed place.—Direct to Mr. Clark, Seedsman, 25, Bishopsgate-within.

AS GARDENER.—A Single Man, aged 34, who understands his business; Greenhouse, Hothouse, and Frames; Vines and Flower Garden. Can have six years' good character. No objection to a single-handed place.—Direct to C. C., Mr. Checkley, 7, Upper Wellington-street, Covent Garden.

AS GARDENER.—A single Man, native of Scotland, who has had extensive practice in all the branches of his profession in Scotland, and has held a responsible situation the last three years and a-half in the neighbourhood of London, which he has lately left.—Direct to A. K., at Mr. Halley's Nursery, Blackheath, Kent.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

ROYAL BOTANIC SOCIETY, Regent's Park.—The days appointed for the EXHIBITIONS of PLANTS, FLOWERS, &c., in the Gardens of this Society, for 1845, are the following:—

Wednesday, May 7th;
Wednesday, June 4th;
Wednesday, July 2d;

A PROMENADE will take place on each of the other Wednesdays in the same months. J. De C. Sowerby, Sec.

WEST KENT GARDENERS' ASSOCIATION FOR MUTUAL INSTRUCTION.—The Provisional Committee of the above Institution beg to inform their Friends, and Gardeners generally, that a Meeting to adopt Rules, elect Office-bearers, receive Subscriptions, and make such arrangements as are necessary for the proper management of the Society, will be held at the Rooms of Mr. Gilbert, Montpelier Row, Blackheath, on Wednesday, Nov. 27th, at 7 P.M., to which all persons interested in such Associations are most respectfully invited. W. P. Ayres, Secretary *pro tem*.
Blackheath, Nov. 21, 1844.

TULIP SEED, &c.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty the Queen, and to His Majesty the King of Saxony, having observed in the Leading Article of the *Gardeners' Chronicle* of last week a notice of raising TULIPS from Seed, he begs to state that he has saved a large supply of Seed this season, which can be had in packets at 5*s*. each. He also begs to offer the following articles:—

	£.	s.	d.
100 Tulips, in 50 fine sorts, with names	5	0	0
Superfine mixtures, 21*s*. per 100.			
100 Ranunculuses, in 100 superfine sorts, with names	2	10	0
Superfine mixtures, 10*s*. 6*d*. to 21*s*. per 100.			
100 Anemones, in 100 superfine sorts, with names	2	10	0
Superfine mixtures, 10*s*. 6*d*. per 100.			
25 Auriculas, in 25 superfine sorts, with names	3	3	0
25 pair of Carnations, in 25 do. do.	2	10	0
25 pair of Picotees in 25 do. do.	2	10	0

Lilium lancifolium album, good bulbs, 3*s*. 6*d*. each.
" " punctatum " 7*s*. 6*d*. "
" speciosum, true " 52*s*. 6*d*. "
Foreign orders executed.

THUNBERGIA CHRYSOPS.—Plants of this new and beautiful Creeper, dark rich purple with a golden eye, 5*s*., and 7*s*. 6*d*. each. Also strong bushy plants of Superb Seedling Cinerarias well trussed and forward for flower, containing every shade of dark and light-blue tints, furnishing to the Greenhouse, Conservatory, or Drawing-room an ornamental and splendid continuance of elegant bloom throughout the winter months, 6*s*., 9*s*., and 12*s*. per dozen.

	s.	d.
Packets of the best mixed seed of do.	2	6
Do. that large Anagallis Brewerii	2	6

Application, including Post-office order or stamps, will be carefully executed.—Direct to Michael Brewer, Senior, Cambridge Nursery, Cambridge.

IMPORTANT TO PLANTERS.
HEX OR EVERGREEN OAK.

W. E. RENDLE has a large Stock of this most valuable hardy tree, and can supply fine two-year old Seedlings, from seed-pans, at 20*s*. per 1000, package and carriage free to the Exeter terminus of the Great Western Railway.
Union Road Nurseries, Plymouth, Nov. 19, 1844.

JOHN BELL begs to inform the Public he has a Large Stock of Strong VINES in pots, 2 and 3 years old, from Eyes, at the following prices:—

Strong 2 year old Vines in Pots	5*s*.	0*d*.
" 3 " " "	7	6
Very Strong Fruiting " " "	10	6

FASTOLFF RASPBERRY.

J. Bell begs to refer the readers of the *Gardeners' Chronicle* to his Advertisement last week, of the above Raspberry.—Horticultural Establishment, Bracondale Seed Warehouse, 3, Exchange Street, Norwich.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, HIS GRACE THE DUKE OF MARLBOROUGH, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL and CO. beg to announce they are again able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

Packages containing 100 Canes	£2	0	0
Ditto " 50 "	1	1	0
Ditto " 25 "	0	12	0

For particulars of the above, see Youell & Co.'s Advertisement of Nov. 9th.

Youell and Co feel it due to themselves to state that a spurious kind was offered for sale by other parties last season, under the title of "Fastolff Raspberry," the same having no pretensions to the genuine variety; and to obviate a repetition of the like they have appointed the following Nurserymen and Seedsmen as their Agents for the sale of it, at whose establishments may be seen engravings of the Fruit:—Bury St. Edmunds—Mr. R. Pettit; Canterbury—Mr. W. Masters; Carlisle—Messrs. Little and Ballantyne; Chichester—Messrs. Newman and Co.; Cliff Vale, near Leek, Staffordshire—Mr. F. Fox; Cork—Messrs. Haycroft; Doncaster—Mrs. Milan, Seed-shop; Dundee—Messrs. Urquhart and Son; Durham—Messrs. Hancock and Sons; Edinburgh—Messrs. Peter Lawson and Son; Fulham—Messrs. Whitley and Orsborn; Glasgow—Messrs. Drysdale and Co.; Lincoln—Mr. W. Palethorpe; Halifax—Mr. W. Throp; Jersey—Mr. B. Saunders; Leeds—Messrs. Ely and Son, Rothwell Haigh; London—Messrs. Flanagan and Son, No. 9, Mansion House-street, and Messrs. Noble, No. 152, Fleet street; Liverpool—Mr. James Cuthbert, 12, Clayton-square; Manchester—Mr. H. D. Cormack; Nottingham—Mr. J. F. Wood, The Coppice; Peterborough—Mr. John White; Penzance—Mr. J. Fox; Plymouth—Mr. W. E. Rendle; Sheffield—Messrs. Fisher, Holmes, and Co.; Southampton—Mr. James Ingram; Stafford—Mr. J. Sandy; Torquay—Mr. J. Morgan; Wakefield, Mr. W. Barratt; Waterford—Messrs. Fennessey and Son; Westerham, Kent—Mr. I. Cattell; Wexford—Mr. James Harpur; York—Messrs. T. and I. Backhouse.

YOUELL'S CELEBRATED TOBOLSK RHUBARB, the earliest sort known; fine roots, fit for forcing, 12*s*. per dozen. For Particulars, see their Advertisement of Nov. 2.

Finest Imported DUTCH HYACINTHS, 6*s*., 12*s*., and 18*s*. per doz.; for Particulars of which, together with the Extensive and Select Collection of CARNATIONS, PICOTEES, and PINKS, see their Advertisement of Nov. 9.
Great Yarmouth Nursery, Nov. 21.

UNDER THE PATRONAGE OF HER MAJESTY.

J. G. WAITE, Seedsman, &c., 1 and 4 Eyre-street Hill, Hatton Garden, London, embraces the present opportunity of returning his best thanks for the very liberal support he has hitherto received, and to assure his friends that no exertion shall be wanting on his part to merit a continuance of their favours.

J. G. W. most respectfully informs the public that Seeds of every description (with the exception of Carrots) are unusually fine this season, and he will offer them at very low prices.

Waite's Queen of Dwarf Peas, per quart - - 7*s*. 6*d*.
A splendid new variety, growing only 1 foot high, producing a larger pod than any of the same habit; the seed is quite distinct from all others, and larger than any Dwarf Pea in cultivation. It has been grown at the Royal Gardens at Frogmore, and approved of as a new variety, and also at Her Majesty's table, for its superior flavour.
Cuthill's Black Spine Cucumber, per packet of 100 seeds 5*s*. 0*d*.
Waite's Race Horse, do., 32 inches long, Black Spine, and wonderful bearer per packet of 20 seeds 5*s*. 0*d*.
True Beechwood Melon - - - - of 25 do. 2*s*. 6*d*.
Pimelias, ectabilis, new - - - - of 5 do. 2*s*. 6*d*.

J. G. W.'s unrivalled priced Catalogues of Seeds will be ready at the end of the month, and can be had on application at 1 and 4, Eyre-street Hill.—November 23, 1844.

THE TRUE FASTOLFF RASPBERRY.

YOUELL and CO. take the present opportunity to state that the above unequalled Raspberry is to be obtained only at their Nursery or of their Agents, a list of whom appear on the Advertising Sheet of this day's *Gardeners' Chronicle*; and they recommend their friends to be cautious of whom they purchase, as another Raspberry, under the above title has been substituted by certain parties as the "true variety."
Great Yarmouth Nursery, Nov. 21, 1844.

SUPERB DWARF ROSES.

F. GODWIN, having a very large Stock of DWARF ROSES, including the most approved varieties of the Hybrid China, Gallica, Provence, Damask, &c., is offering them at the following reduced scale of prices:—

100 Strong Plants in 50 named varieties			25*s*.
50 do.	25	"	15*s*.
24 do.	"	"	8*s*.

Sheffield, Nov. 23, 1844.

NAPOLEONA IMPERIALIS.—A few Plants of this beautiful Shrub, lately described by Dr. Lindley, in the "Botanical Register" may be purchased, price Five Guineas each, by application to Messrs. Thos. Gibbs and Co., the Seedsmen to the Royal Agricultural Society of England, corner of Half Moon street, Piccadilly, London.

THE TRUE FASTOLFF RASPBERRY.—In last week's *Gardeners' Chronicle* are two Advertisements issued by certain parties, offering for sale what they term "the Fastolff Raspberry." Upon referring to these Advertisements it will be found that one states it to have originated in the garden of Mr. Jary, of Burlingham, and the other in that of Mr. Lucas, of Filby, thus placing the correctness of their statements in a very questionable point of view. Mr. Rivers states that the fruit upon which Dr. Lindley pronounced his opinion was gathered in what he terms "the Filby garden." Youell and Co. beg to say that this assertion is utterly void of truth, and they regret Mr. Rivers should have lent his name to the publication of such.

As to the true origin of this valuable variety, Y. & Co. beg to say that they fully believe it originated in the garden of the late Rev. G. Lucas, of Little Ormesby Hall, in this county, and who was a most intimate and highly-valued friend of theirs (not the Rev. G. Lucas, of Filby), and where they had ample opportunities of making themselves thoroughly conversant with the variety they are sending out as the "True Fastolff Raspberry;" and since that period they have bestowed every care and attention in purchasing every cane of this Raspberry, and marking the same during the fruiting season, which is the only time when this variety is to be detected from several kinds grown in this locality, and called the "Filby Raspberry," "Seedling," &c. Y. and Co., at a cost of between 300*l*. and 400*l*., brought before the public the "True Fastolff Raspberry;" the demand it met with, the distinguished patronage it enjoys, and the many marks of approbation they have received for thus bringing into public notice a most valuable fruit, which would, until now, have remained in obscurity, and gratified the wishes of certain parties, and thus deprived the Horticultural world (*pro tempore*) of so great an addition to their collection of fruits. Youell and Co. having purchased all the available stock of this Raspberry, knowing such to be correct, and rejecting many grown in this neighbourhood, which may, perchance, be palmed upon the public as the True Fastolff, &c., they again caution their friends that they cannot be held accountable for its answering the merits ascribed to it by them, unless purchased at the Great Yarmouth Nursery, or of their Agents, a list of whom appear on the advertising sheet of this day's *Gardeners' Chronicle*.
Great Yarmouth Nursery, Nov. 21, 1844.

KNAP-HILL NURSERY, NEAR BAGSHOT, SURREY.

HOSEA WATERER (Brother and Successor to the late Michael Waterer), respectfully begs to announce that the American Plants this year are remarkably well furnished with bloom; and with the other articles which are generally required for forcing, he has this season to offer very fine plants of the hardy Scarlet Rhododendrons. This Nursery has long been celebrated as containing the finest Collection of American Plants in the kingdom; independent of this, H. W. is a most extensive grower of Hardy Ornamental Trees and Shrubs, Roses, Forest and Fruit Trees; this may be inferred from the fact, that the Nursery extends over near 100 acres of land. The Knap-Hill Nursery is 2½ miles from the Woking station of the South Western Railway.

All letters intended for this Nursery must be addressed Knap-Hill, near Bagshot, Surrey.—Nov. 23, 1844.

PLANTING SEASON.

R. WHITE and Co. have to offer the following at very moderate rates, viz.:—PINUS MENZIESII, INSIGNIS, SPECTABILIS, GRANDIS, PONDEROSA, HARTWEGII, DOUGLASSII, DEODORA, 1 to 5 feet; EXCELSA, and many other rare sorts. Also strong Quickset, Beech, Birch, Oak, Maple, Spruce, Larch, and all kinds of Forest-trees, Rhododendrons fine at 60*s*. per 1000. A collection of Roses, comprising upwards of 700 of the most distinct and beautiful kinds, which have been carefully selected. In the Fruit Department there is a fine collection of Master and Trained Trees of Peach, Apricot, Nectarine, Pears, Apples, Cherries, &c., which includes all the first kinds of Pears now in cultivation. Of Ornamental Shrubs, there is a fine healthy stock of all the finest kinds, and from the light nature of the soil in which they are grown trees from this Nursery will be found to thrive remarkably well after transplanting. Geraniums, finest kinds, comprising—Duke of Cornwall, Surprise, Lord Ebrington, Circassian, and good kinds, 21*s*. per doz. Hoxsince Melon, true, 2*s*. 6*d*. per packet, 6 seeds.

NEW AND SPLENDID RHODODENDRONS.

RHODODENDRON WILLIAMSONII. — This magnificent variety was forwarded for the opinion of Dr. Lindley and also of Mr. Glenny. Dr. Lindley (see *Gardeners' Chronicle* for May, 1844—"*G. B. S.*—Your seedling makes a handsome and showy variety for the garden; the heads of the flowers are large, compact, rich in colour, and the foliage is very handsome." Mr. Glenny (see *Gardeners' Gazette* for May, 1844—"*G. B. S.*—It is a very great acquisition; size very large, bright rose, well spotted, and if bloomed in the open ground, a valuable addition to our hardy plants, for the foliage is as perfect as the flower."

RHODODENDRON INVICTUM.—A very dazzling deep rosy crimson, very dark spots, a most distinct and superb variety, and blooms later than most of the hybrids, and quite hardy. The above two splendid Hardy Rhododendrons now offered to the public were raised by Mr. Waterer, the Curator of the Sheffield Botanic Garden, where Invictum has flowered for several years, and has been the admiration of all who have seen it. Price for the two, 21*s*.

Apply to F. Godwin, Nursery and Seedsman, Sheffield; W. and A. Godwin, Market Drayton; or Messrs. Warner and Warner, 2, Cornhill, London, where paintings of the above may be seen.

ENGLISH OAKS FOR TIMBER.—THE TRUE QUERCUS SESSILIFLORA AND Q PEDUNCULATA.

W. JACKSON & Co. beg most respectfully to call the attention of the Nobility, Gentry, and Planters in general to the above valuable Trees, of which they possess a fine healthy stock, grown from Seeds carefully collected from their own timber-trees. Two years' Seedlings, 6s. 6d. per 1000. Transplanted, 1 to 1½ ft., 1½ to 2 ft., 2 to 3 ft., and 3 to 4 to 6 ft.: Prices with every other particular will be given on application. Carriage paid to Newcastle, York, and London, when ordered in large quantities.

Cross Lanes Nursery Office, Bedale, Yorkshire, Nov. 19.

SEEDLING RANUNCULUS ROOTS which have never bloomed, they being the most desirable to form flowering beds; although small, rarely ever fail to bloom well.

S. WALTERS, Florist, Hilperton, Wilts, begs respectfully to acquaint the admirers of this lovely flower, the Queen of Flora, he is well prepared to offer the above to a great advantage, as one trial will prove their superior strain. 10s. 6d. per 100, forwarded post-free to any part of the kingdom. S. W. has paid much attention to the growing of Seedling Ranunculus for many years, and he is proud to say with no small success; as, during blooming season, may be seen the selection from extensive beds for the past nine years, among which are models of Nature's best work.

Ranunculus Seed, in packets, 5s. each.

GERANIUMS AT VERY LOW PRICES.

WM. E. RENDLE, having a large stock of the following sorts of GERANIUMS, is enabled to offer them at very low rates.

*** A dozen will be forwarded on receipt of a Post-office order, including hamper, package, and carriage free to the Exeter terminus of the Great Western Railway.

Class 2.—24s. per dozen, including package, carriage, &c.—Evelina, Gipsey, Witch, Hamlet, Cynthia, Aurora, Creole, Lady Cotton Sheppard, Countess of Mount Edgcumbe, Fair Maid of Devon, Wonder of the West, Portia, Jupiter, Life-guardsman, King John, Sultan, and Princess Royal (Lyne).

Class 3.—15s. per dozen, including package, carriage, &c.—Camilla, Consort, Van Amourgh, Enchantress, Glory of the West, Ivanhoe, Flash, Queen of the Fairies, Grand Monarch, Amethyst, Wildfire, Mabel, Prince Albert, Nymph, Bridegroom, and Sybil.

All the plants are strong, healthy, and well established, and will be forwarded immediately on receipt of order.

Union Road Nursery, Plymouth, Nov. 23, 1844.

PLANTING SEASON.

W. ROGERS AND SON, Nurserymen, Contract Planters, & Landscape Gardeners, Southampton, beg respectfully to notify that their Nursery Stock is this season unusually fine, and from the extent of their grounds they are enabled to execute orders to any amount, and at the lowest price; delivered free of carriage (if ordered in quantity) per railway to London, or by steam-vessels coastwise.

SEEDLING.

Ash, 1 yr., 1s. 6d.	per 1000.	Spanish Chesnut, 1 yr., 10s.	per 1000.
,, 2 yrs., 2s. 6d.		Pinaster, 1 yr., 2s. 2d.	
Beech, 1 yr., 2s.		2 yrs., 3s. 6d.	
Birch, 1 yr., 2s.			

Sea Pine (Pinus maritima), excellent for nurses or exposure to the sandy sea-shores of Scotland or Ireland, 1 yr., 5s., 2 yrs., 7s. 6d. per 1000.

Oak, the true "Durmast" of the New Forest (Quercus sessiliflora), producing timber of the largest dimensions, and decidedly the most valuable species of the English Oak, 1 yr., 7s. 6d., 2 yrs. 10s., 3 yrs. 15s. per 1000.

TRANSPLANTED.

Prices and samples of the various sizes may be had on application.

Alder	1	2 ft.	Oak, "Durmast," English	1	2 3 ft.
Beech	1	2 4 ft.	Turkey	1	2 5 ft.
Birch	1	2 4 ft.	Spruce	1	2 6 ft.
Ash	1	2 3 ft.	Larch	1	2 3 ft.
Spanish Chesnut	1	2 6 ft.	Scotch	1	2 4 ft.
Elm	1	2 3 ft.	Pineaster	1	2 ft.
Poplar, Blk. Canada	2	4 6 ft.	Sea Pine	1	2 ft.

If 100,000 of any one sort is ordered, a deduction from these prices will be made.

Plants for Cover or Underwood.

Rhododendron ponticum, 1 to 2 inches, 20s. to 30s. per 1000.

Ditto, 2 to 4 inches, 40s. to 50s. per 1000; 4 to 6 inches, 60s. to 80s. per 1000; 1 foot, 20s. per 100.

Mahonia aquifolia, 40s. per 1000. Game are remarkably fond of the fruit of this plant, which is also a handsome flowering Evergreen.

Common Laurel, 20s. to 40s. per 1000.

Come-well Willow, 4s. per 1000. (Best for Underwood.)

Furze, 10s. per 1000. Broom, 10s. per 1000.

Elder, common black, 8s. per 100. Excellent for sea embankments. Tamarisk, 8s. per 100.

MISCELLANEOUS.

A great Stock of Forest and Ornamental Trees of large growth, from 6 to 10 feet, adapted for immediate effect.

Single Camellias, from pots, well rooted, 50s. to 75s. per 100.

Rose stocks, 8s. per 100, from cuttings of the Bourbon Ile Lisle, on which all kinds take freely by buds and grafts, and may be grown in the smallest sized pots.

Double Furze, 25s. per 100. Forms a beautiful flowering hedge.

Double Red Thorn; Double White do.; Single new crimson, 50s. per 100. Sea Pine, from pots, 40s. per 100.

Ribes sanguineum, 12s. 6d. per 100. Kalmia latifolia, 40s per 100.

Printed Catalogues and Prices of their general stock may be had. Gardeners of experience and ability recommended.

ROSES.

MESSRS. LANE AND SON, Great Berkhampstead, Herts, have an extensive and well-grown Stock of Standard and Dwarf Roses, which they are enabled to offer at the following prices, the selection being left entirely to themselves, viz.—

DWARFS good old sorts without names, on own roots	30s. per 100
Ditto ditto with names, in pairs, on own roots	50s. per 100
Ditto superior ditto	12s. to 30s. per doz.
STANDARDS, first rate	10l. per 100
Ditto ditto	24s. to 30s. per doz.

They have also an immense Stock of Roses in pots for greenhouse culture, at from 18s. to 30s. per doz. Likewise numerous others at a much lower rate, but which they could not confidently recommend.

Rose Catalogues for 1844-5 may be had on application to the Nurseries, inclosing a 2d. postage stamp.

Great Berkhampstead, Nov. 20, 1844.

JESSOP'S NURSERY, Cheltenham, Established in 1815, from its extensive connection offers peculiar advantages to Noblemen and Gentlemen requiring Gardeners, Foresters, or Farm Bailiffs, of established skill and reputation. All communications promptly attended to.

KNAP HILL AND BAGSHOT NURSERIES.

NOTICE.—The Business of these Nurseries, since the death of the late Michael Waterer, carried on in the name of H. and J. WATERER, is by mutual agreement divided. The KNAP HILL NURSERY will in future be carried on by HOSEA WATERER, and that at BAGSHOT by JOHN WATERER. It will, therefore, be of importance, to prevent confusion, that correspondents be particular in the address and direct letters intended for the Knap Hill Nursery, to Hosea Waterer, Knap Hill, near Bagshot; and those for the Bagshot Nursery, to John Waterer, Nurseryman, Bagshot, Surrey.—November 23.

SHILLING'S EARLY GROTTO PEA.

THE above PEA possesses advantages over every other for autumn sowing, being quite hardy, very prolific, and much larger than any other early Pea. See *Gardeners' Chronicle*, 25th of last May. "Mr. Shilling has sent us specimens of his New Early Grotto Pea, which were gathered on the 20th inst. He states that these were produced from seed sown in the open ground on the 25th of last November. Judging from the specimens sent, this is a fine, large, good-looking Pea, and will, no doubt, be found to be a very useful early variety."

To the Market Gardener they will be found invaluable. Price 1s. 6d. per quart, 10s. per peck.

SHILLING'S QUEEN CABBAGE, which gave such general satisfaction last year, as the best early variety grown. Having saved a considerable quantity of seed this summer, it is offered on the following advantageous terms:—1s. 6d. per oz., 10s. p. lb.

Agents—Messrs. Field and Cahld, 119, Lower Thames-street; Messrs. J. and W. Noble, 152, Fleet street; Mr. J. Kernan, 1, Great Russell-street, Covent Garden; Messrs. Hurst and M'Mullen, 6, Leadenhall street, London.

Northwarnborough Nursery, Odiham, Hants.

DUTCH HYACINTHS for forcing, Single and Double at 4s. per dozen; also Narcissi, Crocuses, Tulips, Irises, Jonquils, Anemones & Ranunculuses; priced Catalogues of which will be forwarded per post, from Arthur Cobbett's Italian and Foreign Warehouse, 18, Pall Mall.

Double Italian Tuberose roots expected the end of next month.

BAGSHOT NURSERY, SURREY.

JOHN WATERER begs to call the attention of the Nobility, Gentry, and Public, to his unlimited collection of AMERICAN PLANTS, which are this season unusually well set with bloom buds, particularly those for forcing, comprising,—Rhododendrons, Kalmias, Azaleas, Andromedas, Ledums, Daphne cneorum, &c. Also those of larger sizes, among which may be had Rhododendron, Catawbiense, and many other fine varieties; Kalmia latifolia, Magnolias, of sorts; Azalea coccinea major, and aurantia, &c., &c., from 3 to 6 feet, which are fine objects for single specimens or borders, being bushy to the ground. J. W. begs to recommend his unrivalled Stock of Cedars of Lebanon, 18 inches to 4 feet; also about 200, 4 to 9 feet, bushy to the ground, very handsome for Lawns; the whole of them warranted to move safely. Also about 6000 Spanish Chesnuts, 4 to 6 feet; 50,000 Larch Firs, 2 to 4 feet; 50,000 Birch, 3 to 4 feet; the whole of which may be had at moderate prices. N.B.—Planting done by contract.

Nursery, Bagshot, Surrey, 3½ miles from Farnborough Station, South Western Railway.

TO PEAR-GROWERS.

RENÉ LANGELIER, Nurseryman and Florist, CLARENDON NURSERY, ST. HELIER, JERSEY,

Begs leave to draw the attention of Pear-growers to his new PEAR, named "LANGELIER'S BEURRÉ" of first-rate merit; perfectly melting ripe in January; shape of Napoleon, but larger in size; standard, tree very vigorous; one of the best flavoured Pears known, otherwise it would not be recommended by R. L., as his motive for advertising it is not for the sake of publishing, but for the good of the public in general, to whom he is happy to have the opportunity of rendering himself useful; of which "Von Mon Leon Le Clerc" will be a sufficient guarantee, having proved itself as it was represented, and given universal satisfaction. The trees of this Superb New Beurré are small and limited in number, and the price will be 21s.; if 6 trees are ordered, 7 will be sent; no discount will be allowed to the trade, and to the trade only will 8 plants be sent for 6; the number is very limited. R. L. also takes this opportunity to state that to this day numbers of "Von Mon Leon Le Clerc" remain unpaid for, consequently none will be sent to unknown correspondents, except for ready cash, or post office order.

As this is the season for planting, R. L. wishes to draw the attention of the public to his acknowledged unrivalled Collection, of which a List may be had by pre-paid letter, and begs to state that nothing is sent from his Establishment except proved fruit, unless requested. R. L. also wishes to obtain attention to a small quantity of EVERGREEN OAKS, among which will be found a great variety; they are fine and healthy, 2 years old, about 18 inches to 2½ feet high, fit for planting or potting, price 20s. per 100. Also, fine KIDNEY POTATOES, superior in flavour and produce to the Ash-leaf; the sample, extra fine, 5s. 6d. for 34lbs. weight, as not less than that quantity will be sent.

TO THE PLANTERS OF ENGLAND.—TRUE HIGHLAND PINE.

JAMES GRIGOR, Nurseryman, Norwich, begs to remind such of the Planters of England as are anxious to enhance the beauty and value of their estates, that he is now sending out plants of this recently introduced and very desirable timber-tree, at the undermentioned prices:—

Single plants, strong and well rooted	6d. each.
Strong plants, 20 inches high	5s. per 100.
Do. 18 ,,	30s. per 1000.
Smaller-sized plants	from 10s. to 20s. ,,

For introducing this tree Messrs. Grigor, of Elgin and Forres, were awarded several premiums by the Highland and Agricultural Society of Scotland, where it is rapidly superseding the common Pine. In its old age it assumes in a great measure the darksome grandeur of the Cedar of Lebanon, and is therefore invaluable for planting in masses throughout the more prominent parts of distant landscapes. Sir Walter Scott describes it as presenting much of "the bold and contorted figure of the Oak;" and the *Quarterly Review* recommends it as an acquisition to churchyards and cemeteries. It is highly esteemed for all economical purposes, on account of the hardness and durability of its wood.

N.B.—J. G. has for the present disposed of all his potted plants; but as the others have excellent roots, there is no risk in removing them. A supply in pots will be ready in the course of next month.

CEDRUS DEODARA, raised from seeds in the open ground, 10s. each. Arancaria imbricata, Pinus excelsa, &c. &c. on reasonable terms.

J. B. SMITH, having purchased the rare and valuable STOCK-IN-TRADE of the executors of his late father, begs leave to inform the Nobility, Gentry, and Amateurs, that he intends carrying on the Business as hitherto, and shall be glad to be favoured by their kind commands, which shall ever meet his best attention. A choice collection of Rhododendrons, Azalea Indicas, Hardy Azaleas and Ghent Azaleas, Camellias, Roses, Pelargoniums, Liliums, &c., including the most novel and approved varieties; a priced list of which may be had on application. A liberal discount for cash. A remittance or reference from unknown correspondents is solicited.

Norbiton Nursery, Kingston, Surrey, Nov. 23.

S. WALTERS, Florist, Hilperton, Wilts, respectfully offers to Public notice his Seedling GERANIUM ECLIPSE, a very large bold delicate flower, with great substance, pure white, with dark spot, veined with intense bright crimson; habit erect and bold, making it conspicuous among any number. Plants 10s. 6d. each.

Also a very superior Seedling Petunia, "Pink Pet," one of the best Selfs, possessing the properties so deficient in Selfs—roundness and substance—with a beautiful rose pink colour; free bloomer, holding its blooms up well. Cannot fail to give satisfaction. Plants in April, 3s. 6d. each.

NURSERY STOCK.

RICHARD MITTON, Nurseryman, Pontefract, being about to clear off five Acres of Nursery Stock, consisting of Forest and Fruit-trees, Evergreen and Flowering Shrubs, &c., begs to offer the same at unusually low prices. Particulars may be had on application.—Pontefract, Nov. 23.

DAHLIAS.—"BEESWING."

W. C. DRUMMOND having purchased the entire stock of the above greatly-admired and splendid Flower, raised by Charles Sainsbury, Esq., Swainswick, near Bath, for 100 Guineas, W. C. Drummond begs to announce that he will be ready to supply strong healthy plants the first week in May, 1845, at 10s 6d. each, height 4 feet. It is quite new in colour, being a very dark-shaded red; a large size well up in the centre, of great depth of petals beautifully cupped and very constant, and second to no Dahlia in the world. Wherever a stand of 6 or 3 blooms is shown, "Beeswing" must be one of them. The numerous Prizes it has obtained, as well as from the high opinion expressed by the very best judges who have seen it exhibited and growing, W. C. D. anticipates that it will give more satisfaction than any Dahlia hitherto sent out. It has been placed a first-class flower at the following places, in 1843:—4, Bath; 4 Seedling Prizes, and in three winning stands; Bristol, 1 do., and in 2 do. stands; Chippenham, 1 do., and in 1 do. stand; Thornbury, the Plate Prize; a prize at Chelmsford; Stonehenge, 1; and first Prize Self do.; and one of the six first-class flowers placed by the Judges at the Grand Dahlia Show, Bazaar, Baker-street, London. A coloured plate of this flower will appear in the first Number of the "West of England Florists' Magazine," to be published the 1st day of January, 1845, at No. 6, New King-street, Bath. A list of Nurserymen who have given orders for "Beeswing" will appear in the *Gardeners' Chronicle*, January, 1845. W. C. D. will be happy to make a match with "Beeswing" against any six named Dahlias for 1l. per bloom, to be shown at the Grand Metropolitan Show, in Sept. 1845.

Alice Hawthorn, a beautiful clear white, with a rosy purple tip, which has obtained 4 Seedling Prizes, and in 7 winning stands, is a most perfect form, well up in the centre, cupped, and a good show flower; height, 4 feet. Plants in May, 10s. 6d. N.B.—A few ground roots will be sent out of this flower in exchange for anything new and good, at 3l. per root.

Weston Road, Bath.

THE PLANTING SEASON.

NEWTON AND UPTON NURSERIES, CHESTER.

WE respectfully beg to draw the attention of Noblemen, Gentlemen, and others, to our EXTENSIVE and very SUPERIOR STOCK of Seedling and Transplanted FOREST TREES, now growing at our Nurseries as above, which comprises all ages and sizes of Larch, Scotch, Spruce, Silver and Balm of Gilead Firs; Oaks, Alder, Elms, Ash, Beech, Birches, Chesnuts, Hazel, Hornbeam, Sycamore, Poplars, Privet, Hollies, Thorn Quicksets, &c. &c.

Having for a series of years devoted considerable attention to the rearing of FRUIT TREES, we are happy to announce that our present Fruit Tree Grounds are thoroughly stocked with fine well-rooted Trees of every description, suitable for Walls and Orchards, and such as we can with much confidence recommend, being all correctly named,—so desirable to Fruit Tree purchasers.

In our ROSE department, we cultivate all the most esteemed varieties, annually adding such New Kinds as are considered first-rate, either in their formation, colour, or perfume. And in the training of our Standards, Half Standards, &c. great pains have been taken to graft on carefully selected and healthy stocks.

The other parts of our Nurseries also abound with full collections of the Pinus Tribe, Herbaceous and Alpine Plants, American Evergreen and Flowering Shrubs, Greenhouse and Orchidæous Plants, Dahlias, Carnations, Pinks, Tulips, Verbenas, Lobelias, Pansies, and every other article connected with the Nursery business.

We have now ON SALE, at our Warehouse in Chester, Winter Vetches, Winter Oats, and Rye, several newly imported Seed Wheats, &c.; Italian and Dutch Bulbs, this being the proper season to plant Hyacinths, &c. in pots and glasses.

Orders will command our utmost attention.

FRANCIS & JAMES DICKSON—who have at present on their list a number of experienced Gardeners, Land Stewards, and Wood Foresters, whose characters and abilities may be strictly relied on.

November 20, 1844.

*** Plantations Contracted for to any extent.

NAMED TULIPS for SALE.—Six Beds of 40 rows, or 280 roots each, and each Bed containing about 140 varieties. Catalogues and prices may be had on prepaid application to Wm. Pattinson, Etterby Hill, near Carlisle.

TO NURSERYMEN, SEEDSMEN, AND OTHERS.

LAVENDER HILL NURSERY, WANDSWORTH ROAD.

UNRESERVED SALE OF EXTENSIVE NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the late Mr. Pamplin, to sell by Public Auction on the premises, Lavender Hill Nursery, Wandsworth road, near London, on Monday, Dec. 2d, and following days, at 11 o'clock on each day, the whole of the EXTENSIVE and VALUABLE NURSERY STOCK, comprising a large quantity of the finest Hardy Evergreens of all sizes, which remove particularly well out of this ground; Fruit and Forest Trees, Shrubs and American Plants; Hardy Herbaceous Plants; large and small Camellias; a very capital collection of Ferns, some of which are of extreme rarity; Garden Frames and Lights; Shop Fixtures and general Fittings of a Seed shop and Counting-house; Stock of Seeds of the present Harvest; Garden Implements, a useful Horse, Carts, Barrows, &c.; several thousand yards of Box Edging; about 200 Pollard Willows with their lop and top; Evergreen and other Hedges; also some growing Crops, as Mangold Wurzel and Turnips; together with many useful articles.

The whole will be sold without the least reserve, the premises having been disposed of for other purposes, and must be cleared before Christmas.

Catalogues will be ready one week prior to the Sale, and may be had on the premises; at most of the Seedshops in London; at No. 45, Frith-street, Soho; and of the Auctioneers, Leytonstone, Essex.

TO AMATEUR DAHLIA GROWERS AND FLORISTS.

TO BE DISPOSED OF at a very low price, the property of an Amateur, upwards of 300 Ground and Pot Roots of DAHLIAS, comprising all the best sorts of the old varieties, and a number of the most approved new varieties, such as Standard of Perfection, Nonpareil, Lady St. Maur, Lady Antrobus, and Emma Noke, &c. Persons desirous of purchasing the whole or any part of the above, may have every information they require, by applying to Y. Z., prepaid, Post-office, Bicester, Oxfordshire.

TO THE CULTIVATORS OF ROSES.

R. B. BIRCHAM, Hedenham Rosery, Bungay, Suffolk, begs to offer the following choice PERPETUAL ROSES. Good dwarf plants, own roots, suitable for pot culture or transplanting into the open borders.

Cloth of Gold (Noisette) strong plants, 7s. 6d.

Choice Roses selected from various classes:—Dwarf Standards, 12s. per dozen; do., superior kinds, 18s.; Standards, 18s. per dozen; do., most superior, 30s.

A descriptive Catalogue sent on application. Plants gratis, to compensate for distant carriage.—Hedenham, Nov. 23, 1844.

THE FILBY, or FASTOLFF RASPBERRY.—At the request of some gentlemen living in the neighbourhood of Yarmouth, T. RIVERS begs to submit the history of this really excellent Raspberry to the public. In the year 1814 Colonel Lucas, of Filby, a place lying between Norwich and Yarmouth, discovered a Raspberry plant growing under an old Laurel hedge in his garden. His attention was drawn to it, and he soon found it to be a superior and delicious variety, so that in a short time every other sort was ejected from his garden, and this alone cultivated. It was not, however, till 1824 that he allowed his gardener to part with it, who then gave canes to his neighbours, and by this means it got to be cultivated in Caistor, Ormsby, and, in fact, in all the neighbourhood, under the name of the FILBY RASPBERRY, to the exclusion of all other sorts. It has latterly often been called the Caistor Raspberry, from the Market Gardeners growing it in that parish. In Caistor is an old castle in ruins, that formerly belonged to the Fastolff family: the latter name was given to the variety by YOUELL and Co., when they first began to sell the canes. The fruit upon which Dr. LINDLEY pronounced his opinion was gathered in the Filby garden, now the property of the Rev. G. LUCAS, who authorises and permits the publication of the above facts; and has also permitted his Gardener to supply the Canes after this date to T. RIVERS only.

Canes are sold at 30s. per 100, or 6s. per score, carriage paid to London. Charge for package, for small parcels, 6d., for large do., 1s. to 1s. 6d. Orders to any amount can be executed. The Trade price will be given on application.

Sawbridgeworth, Herts, Nov. 23, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

SATURDAY,	Nov. 23	Royal Botanic	4 P.M.
FRIDAY,	Nov. 29	Botanical	8 P.M.
WEDNESDAY,	Nov. 27	Society of Arts	8 P.M.
FRIDAY,	Nov. 29	Botanical	8 P.M.
MONDAY,	Dec 2.	Entomological	8 P.M.
TUESDAY,	Dec. 3	Horticultural	2 P.M.
		Linnean	8 P.M.

WHEN we, a few weeks since, invited the attention of our readers to some supposed cases of the TRANSMUTATION OF CORN, we were not aware that so many such instances were on record. Thanks, however, to our correspondents, we have now before us several statements as to one kind of plant changing to another, so that the inquiry seems more than ever to be worth following up. Not that we anticipate a confirmation of these stories, for they do appear most incredible, and contrary to the usual order of things; yet, as we have before observed, some very recent and most astounding instances of change, quite as great as that of Oats into Rye, have occurred, concerning which there cannot be a doubt, and therefore there is no knowing what more may be behind.

Mr. Darwin, who agrees with us that so curious a subject is well worth investigation, "even if it should prove to be only a history of error," points out a passage in Dr. J. Anderson's "Recreations," &c. (vol. ii. p. 238) for the year 1800, where he remarks on an extract from a Dutch journal, in which it is said, that a countryman sowed Oats and cut them green three times, and that "in the ensuing spring only a few stalks set out any fresh shoots, and these were good Rye." Dr. Anderson attempts to explain this by supposing that seeds of both grains were in the ground, and that the Rye, from being the hardier plant, alone survived the winter; and he concludes by exclaiming, "What a bonfire it would make if all the books which record such experiments were burnt at once!" But Dr. Anderson knew nothing of the modern facts above alluded to.

Another correspondent finds the following in the "Million of Facts," by Sir Richard Phillips, p. 153:—"Barley in rainy seasons or years degenerates into Oats; and Oats in dry seasons change into Barley. These facts, related by Pliny, Galen, and Matthiolus, have been confirmed by the experiments of naturalists.—*St. Pierre.*"

Of all the statements, however, which have been made upon this subject, the most remarkable are those of a Dr. Weissenborn, which were published by the late Mr. Loudon in his "Magazine of Natural History," in the year 1837, and from which the following are extracts, with some verbal alterations:—

"Within the last few years two experiments of this sort have been made with more than common care. One was in Livonia. In the middle of a Cabbage-garden, a bed of 12 feet square was carefully dug and pulverised, and sown about the end of June, 1836, with picked Oats. The blade sprang not particularly well, and was thin, as the seed had suffered from frost in the preceding autumn. It was cut, for the first time, when part of it had already begun to form a shoot. The second mowing took place in autumn. This year, the second of the experiment, the bed is covered with healthy Rye-stalks, though fewer in number than the Oat-plants, which stood on the bed last year."

The other case is that of a Lieut.-Col. de Schauroth, who five years previously had found this experiment succeed seven times, and that in every case Rye had sprung from Oats, when the latter, during the first season, had been prevented forming stalks. Col. de Schauroth had been averse to publish his observations, from his dislike to controversy; but as he was fully satisfied about the truth of the phænomenon, "he asked me," says Dr. Weisenborn, "to repeat the experiment; I delayed doing so till I could have an opportunity of sowing Oats on ground which had neither yielded a crop of Rye, nor had been manured with litter for a long time previously. Three years ago, however, I ploughed up a paddock in which there had been nothing grown but Grass for the last 15 or 20 years. It was planted with Potatoes for two years, and the third spring, sown with Oats and Lucerne, which were fed off by sheep, so that none of the Oat-plants could run to ear. During the severe spring of the present year, the greater part of the Oats were destroyed; but when the Lucerne had attained a sufficient size to be fed by sheep, it was found intermixed with a great many healthy Rye-plants, just in ear. It appears unnecessary that the Oats should be sown about midsummer day; and it is very natural that the Rye-plants should be fewer than those of the Oats, because all summer Corn is, in a great measure, destroyed during winter."

These statements were made in 1837. In the following year Dr. Weissenborn again brought the subject before the public, in the second volume of the "Magazine of Natural History." "With reference," he says, "to the transformation of Oats into Rye, this remarkable phenomenon has not only been verified by new experiments, but we have caused beds to be sown with Oats, in order that we may be able to convince disbelievers, by producing Rye stalks which have sprung from the crown that still shows the withered leaves of the Oat plant of the previous year. I repeat that this transformation does take place, if Oats are sown very late (about midsummer-day), and cut twice as green fodder before shooting into ear; the consequence of which is, that a considerable number of Oat-plants do not die in the course of the winter, but are changed in the following spring into Rye, forming stalks which cannot be known from those of the finest winter Rye. We must expect that this fact will be considered by many as a mere assertion, and there are others who are still in doubt about it; the latter, however, own that they either have not made the experiment, or have sown their Oats too early, and, therefore, had cut them oftener than twice, in order to prevent their running to ear, whereby the plant loses the power of surviving the winter, and of being transformed into Rye. I cannot notice such adversaries as reject the result without having put it to the test of experiment, or who rest their opposition on experiments that have not been conducted in the right manner. *Let any one sow Oats during the latter half of June, and the transformation in question will certainly take place!* The time of sowing the Oats did not formerly appear of paramount importance, nor was it believed that it could make any difference whether the Oats were cut more than twice; in consequence of which a few experiments have failed. Now, however, we must conclude, that if the transformation occasionally takes place with Oats that have been sown too early, that is merely an accident depending on a peculiar state of the weather, or other accidental circumstances; whereas the result is quite certain if the Oats are sown towards the end of June. If the soil is too dry about that time, one of the reporters on the subject, to the Agri. Soc. of Coburg (Lieut. Donauer), concludes from an experiment he made in 1837, that one watering, so as to enable the Oats to germinate, may be recommended; although if this be done repeatedly, the high temperature of the season will cause the plants to grow so luxuriantly, that it becomes necessary to cut them three times when about 1½ foot high, to prevent their forming their ear, whereby the object would be wholly or partially lost. If, however, among those who doubt the fact, there be found people who pity us because we trust more to actual experiment than to theory, we should almost feel tempted to pity theorists, whose self-sufficiency has prevented them from thoroughly investigating an important phenomenon which was noticed so many years ago. Nor can we commend the discernment of such as are unable to discover in the plants in question, both the preceding year's dry stubble, and leaves of the Oats, and the fresh stalks and leaves of the Rye, which latter form in May upon the crown of the Oat plant, and produce fine winter Rye. The Society takes credit to itself for perseverance, in having struggled against the opinion of the public for several years, in order to establish a fact which no physiologist would believe, because people are always apt to confound the laws of Nature with those of their systems."

Such is the state of the case, as far as is at present known. We cannot conclude our relation of these strange stories better than in the words of Dr. Weissenborn himself. "It is not," he says, "with a view of engaging anybody to believe the alleged transformation, that I call the attention of the English reader to the above observations, but merely from a wish to relate a curious phenomenon whose frequent recurrence can hardly be doubted, on account of the mass and respectability of the evidence now before the public; and the cause of which, for the same reason, it appears not altogether irrational to inquire into, by repeating the same experiment in various localities."

We wish we could persuade a few gardeners to bear these statements in mind, and to make the trial next year, when midsummer arrives. It is a question much more likely to be answered satisfactorily in a garden than in a farm.

ON PRUNING FRUIT TREES.

As the pruning season is at hand, I beg to offer a few remarks on Pear pruning, more especially the new Flemish kinds; as also a brief account of their general management as pursued by me for the last eight or ten years.

It is notorious to all who are in any way conversant in gardening affairs, that by the old method of close spurring, the trees on walls became gradually barren with their advance in age: this barrenness proceeding from the centre of the tree to the extremities, until at last some three or four hundred feet of walling would be occupied for the sake of a few dozens of Pears, hanging at the extremities of the shoots.

Now the loss of walling, which of itself is no trifle, was not all in this case. The tree had to undergo a thorough revision every year, at stated periods, not with any hope of inducing the tree to become in any way more prolific, but to keep up the decent appearance of the wall.

The habits of the Pear being duly considered, and the circumstance of such limited powers of leaf, with unlimited powers of root, being taken into consideration, who could wonder at such results? A wall of trees treated in this way, if it could be placed on the ground in a horizontal position (with the trees attached), would be no bad representation of a coppice in miniature; and, indeed, the principal points of management bear no small resemblance. To excite the woody principle is the sure result in both cases; but change the case with regard to the Hazel coppice; let the trees grow up free from the pruning knife, and consequently suffer the elaborating powers to reach or overtake the absorbing ones, and the result will be Nuts, instead of crate-wood or faggot-ties.

In the case of wall Pear-trees, an objection of a serious appearance seems to stand in the way: I mean the exclusion of light by suffering the tree to remain unpruned. There is, however, no real difficulty in the affair, as I have proved by experience. The root must be limited—the power of making shoots placed under control. It is well known that the absorbing powers of the Fig are so great in our humid climate, that all good cultivators take care to limit its roots, without which, it is in vain to expect success; and the leaf by this process being much reduced in size, the exclusion of light is by no means so great. Now the tender Flemish Pears are in precisely the same predicament as the Fig, if left uncontrolled at the root; the elaboration of the tree, and fructifying sap is ever in arrears.

In stating my practice, I will begin with the young trees from grafts. I make it a rule to transplant them annually, if possible, commencing with the young plant in the autumn succeeding the grafting season. My object is to exchange tap roots for fibrous ones, and consequently prepare them for a system of complete root-control; thoroughly ripened and short-jointed wood here the object to be obtained; and the next and important object with me is to prepare mounds of brick or stone on which to place them in their final destination.

The subsoil must of course be free from any lodgement of water, and if not naturally so, I of course introduce drainage. The soil I use, and which seems to be the best adapted, as coupled with my shallow border system, is a strong and rather clayey loam from old pastures, which, if the pasture abound in soil, may be dug, turf, soil and all, about six inches in depth.

My platforms are about six feet square, and the fresh dug loam is rough chopped, and tumbled in without farther ceremony; no manure or vegetable matter of any kind is mixed with it, and, indeed, it would be quite superfluous—nay, injurious. The surface of my platforms, before I introduce the soil, is about nine inches below the ground level, and the soil when filled in is one foot in depth, and consequently elevated three inches

above the surface; this will appear much too shallow for the lovers of deep borders, but I am borne out in the practice by facts, as trees thus treated have borne all the vicissitudes of hot and dry periods without flinching. Besides, who that understands the permanent character of stiff yellow loams, would fear a period of drought in this case, provided he had it in his power to apply top-dressings? These last, if rightly applied in emergencies, will, under the above circumstances, give the trees the most perfect immunity from any evil consequences arising from dry weather.

I have every assurance that it would be very good policy to mix lumps of stone, mortar, charcoal, or bricks, in the proportion of one part to three of loam, after Mr. Hoare's manner; but in this case I should increase the depth from one foot to one foot six inches; the probable effect of which would be to lengthen the durability of the tree. However, I will guarantee the trees, without this, to last a person's lifetime, provided the plan is done justice to in all respects.

Steady, yet permanent action of root should be borne in mind as the main object; also a free early action in the spring, which is promoted by keeping the volume of roots within the reach of solar heat, thereby insuring early made wood, together with early rest, and of course well-ripened wood.

In adverting to my mode of pruning, which may of course be divided under the heads summer and winter, I may state that it is exactly the same for wall Pears as for espaliers. I have a different mode from most Pear-growers of training my wall Pears, which I will endeavour to explain; first, however, disclaiming all idea of wishing it to be thought the only good mode. I may merely say that it answers most completely in practice, and is altogether as simple as efficient. The difference between drill-cropping and brpadcast is quite familiar to all your readers: just such, and for similar reasons, is the difference between my mode of training Pears on walls and that commonly practised. Instead of training the spray all over the wall, I tie it down on the main leaders, using them as a trellis.

My leading shoots, however, are further apart than is usual, being laid in at the distance of four bricks apart, or, in fact, about 13 inches. This mode exposes a good deal of naked surface of wall in parallel lines to the action of the sun, for the accumulation of solar warmth, which, of course, radiates on the shoots in the immediate vicinity, as, through copings of a foot, it cannot escape upwards. On this mode I rely, then, for increase of flavour in the fruit, but more especially for the thoroughly ripening of the wood, tending to the production and perfection of fruitful blossoms.

I train my espaliers precisely on the same principle, carrying their main leaders parallel with the ground surface at the distance of a foot. The leaders of my espaliers are rather farther apart than the wall leaders, averaging 18 inches, on account of the less intensity of light in this situation.

My mode of pruning is exceedingly simple:—In the middle or end of July the young spray to be reserved is tied down with matting on the main branches; the person who performs this part of the business is merely directed to tie down all the short-jointed shoots, and more especially those which already show signs of ripeness by ceasing to extend at the point; and after tying these down, to top all the useless spray, cutting it back about one half its length. This we generally do with the shears: it is soon performed. My object in not entirely removing the useless spray at this period is to prevent the organisation of the embryo fruit-bud being disturbed, as it certainly would be in many cases, more especially if the weather were rainy; and for this reason I generally embrace a dry time for performing the operation. I lay much stress on the latter point, simple as it may appear, for whoever will watch the development of Pear-blossoms in spring, and more especially the tender kinds in bad situations, will find many singular anomalies presenting themselves.

When all danger from the bursting of the embryo blossom is over, or about the middle of August, the dubbing-shears are once more in requisition, and the useless spray is cut as close as can be managed without injury; for all the solar light that can now be obtained, will be required to perfect both bud and fruit. This, then, completes my summer pruning.

In the month of December the matting is all cut which fastens down the young spray, and the pruner cuts away all the old stumps and snags which were left by the dubbing-shears, as well as the old spurs which have ceased to bear: these are not merely shortened back, but cut entirely away. No more is done to them at this time, the final pruning being reserved for the period when the blossom swells, and when every blossom-bud can be distinguished, as many kinds, when dwarfed especially, form abundance of buds on the young wood, and as these swell rather later than the spur-blossoms in some cases, much loss might ensue from an earlier pruning. The spray is now thinned out, leaving a regular sprinkling of the shortest-jointed shoots all along the stem; the rest are cut clean off, not spurred back, and the remainder are tied close down with matting. This completes my course of culture, with the exception of covering the blossom; and to effect this I use canvass on the walls, and stick Spruce-fir boughs amongst the espaliers, as no pains should be lost in this respect.

Those who live in the southern parts of the country will think some of my practice superfluous; I have, however, had the Pear to deal with in the neighbourhood of the metropolis, and I can bear ample testimony to the difference in climate.—*R. Errington, Oulton.*

SOME ACCOUNT OF THE NAPOLEONA IMPERIALIS.

Of this plant, the following account has been published in a late Number of the "Botanical Register." We have merely added to the Editor's remarks a cut, to show the structure of its curious flowers:—

"Among the most remarkable plants that have hitherto been discovered ranks this rare species, of which living plants have been lately brought from Sierra Leone by Mr. Whitfield. That indefatigable collector having given me a dried specimen with a seed, and the Earl of Derby having most kindly placed in my hands a bottle containing the flowers in different states, an opportunity has arisen for clearing up the history of one of the most obscure genera in the records of systematical Botany.

"Napoleona was so named by the late M. Palisot de Beauvois, who first found it in the kingdom of Oware, in Western Africa, where it was common, especially in the woods behind the King of Oware's residence. From fragments preserved by that naturalist, a good figure, so far as general appearance goes, was published, but with extremely inaccurate and incomplete details. The flowers were represented as being sky-blue, with a sort of 5-rayed star, of a pink colour in the middle; and upon the whole, the account which he gave of it was so unsatisfactory, that the very existence of the plant has been doubted by some people. In what De Beauvois was right and in what wrong, the following description will show:—

"It forms a bush about as large as a Camellia, according to Mr. Whitfield. The wood is soft, whitish, with large medullary rays, an abundance of dotted vessels, intermingled with brittle acicular tubes of woody tissue, very like what is found in the germinating radicle of a Mangrove. No hairs are to be found on any part of the plant. The leaves are alternate, leathery, between 3 and 6 inches long, obovate-lanceolate, tapering to an obtuse point, and narrowed at the base into a thick channelled petiole about a quarter of an inch long; there is no trace of stipules. The flowers grow in threes, sessile in the axil of the leaves, and are surrounded at their base by several round imbricated scales, as in Camellias; when expanded, they measure 2 inches in diameter; Mr. Whitfield states that when decaying, they assume a bluish tint, which has probably led to De Beauvois's error in representing them as almost wholly blue in their perfect state. The calyx is a thick leathery cup, divided into five ovate segments, having a perfectly valvate æstivation. Within this is placed the corolla, which consists of three distinct rings, each of which is monopetalous. The first ring is Apricot-colour, divided into five lobes, each of which has seven stiff ribs, between which the texture is membranous; the lobes have seven broad teeth, corresponding with the points of the ribs, and much curled and crumpled. By means of the ribs and intervening membrane, this part of the corolla is strongly plaited both before and after expansion; when fully blown, it turns quite back over the calyx, so as to hide it completely. The second ring is very small and thin; it is, in fact, a narrow membrane, stationed at the foot of the first ring, and cut into an indefinite number of fine narrow sharp-pointed segments. This ring was overlooked by De Beauvois. The third ring is rich crimson, according to Mr. Whitfield, membranous, but erect, and assuming the form of a cup, whose edge is cut into many fine segments, turned downwards, so as not to be at all conspicuous. De Beauvois makes this a flat star of many points, which is altogether an error. The stamens are in number 20, standing erect in the form of another cup, of a rich Apricot colour, and unequally united at their base; they have linear-lanceolate filaments, which are much thinner next the anthers, and are there turned inwards; the anther itself is oblong, 2-celled, and erect; it is difficult to conceive how De Beauvois could have made out of this five petal-like filaments, each of which bears two anthers. Next the stamens comes a deep fleshy cup or disk, standing as high as the stigma, and having ten sides, of which the narrowest are alternate with the lobes of the stigma, and two-ribbed in the inside. The ovary is buried beneath the mass formed by the base of the corolla, stamens, and disk, so that unless you cut into the very base of the ovary the cells may be overlooked; it has five cells, in each of which two ovules hang from the top of an axile placenta, which is so attached to the partitions that there is a clear opening from the hollow centre of the style, over the ovules, into the cells of the ovary; the ovules are oblong, with a depression in the middle on each side, and a foramen next the base, the nucleus being curved like a horse-shoe, so that its base and apex are both nearly in contact; the style is 5-angled, or rather 5-winged, and terminated by a table-shaped stigma, with five sides, five rays, and a small elevation at each angle, which elevations are perhaps the true stigmatic surfaces. The fruit, according to De Beauvois, is a soft spherical berry, surmounted by the calyx, one-celled, many-seeded, the seeds lying in a fleshy matter; this is evidently incorrect. Mr. Whitfield found it to be as large as a Pomegranate, and very like one, containing a mucilaginous pulp which is eatable, and a rind so full of tannin, that the natives make an ink from it. The seeds (of which I have seen one, dead and without its skin) are large amygdaloid bodies, kidney-shaped, and as much as 1¼ inch long, with the taste (in that state) of a Spanish Chesnut, but with a bitter after-taste; at their contraction the plano-convex cotyledons hold together by an axis whose radicle and plumule are both immersed in the substance of the cotyledons."

"In the total absence of all correct information as to the real structure of this curious genus, botanists have been unable to arrive at any satisfactory conclusion as to its affinities. All that they have been able to settle is its not belonging to any known natural Order. Palisot De Beauvois stated (1807) that in the opinion of Jussieu, it constituted a new Order between Cucurbitaceæ and Passifloraceæ; a view that was probably taken in consequence of the double-ringed corolla, which is analogous to the coronet of the Passion-flowers, and the plaited corolla with an inferior ovary, which brings to mind the flowers of the Gourd tribe. Desfontaines, on the contrary (1820), refers it, and another genus which he calls Asteranthus, without any doubt, to Symplocaceæ, because of its monopetalous perigynous corolla, its stamens inserted in the base of the corolla, its oblong two-celled anthers, single style, inferior ovary, axillary solitary flowers, shrubby stem, and alternate leaves. Him follows Dr. Robert Brown (1822), who formed it and Asteranthus into an Order called Belvisicæ, without, however, attempting to settle its position in the natural system. He objected to approximating it to Symplocaceæ, doubted its affinity to Passifloraceæ, and compared its structure with that of Rafflesia. Latterly no one seems to have attempted to suggest anything new as to its relationship. Endlicher puts it next Symplocaceæ. Meisner next Passifloraceæ, adding to what had been previously known of it, that its seeds are arillate, a mistake (?) that probably originated in De Beauvois's description of them, 'Semina in pulpâ carnosâ nidulantia.' Finally, I myself, feeling that these could not be its true affinities, placed it in the Campanal alliance, with marks of great doubt.

"It is obvious, from the foregoing description, that Napoleona has nothing to do with any of the Orders to which it has been referred. From Cucurbitaceæ it differs utterly in its hermaphrodite flowers, axile placentation, highly developed corolla, and whole habit; it has in fact no resemblance to that Order. Passifloraceæ seem at first sight to claim a much nearer relationship: because of the triple-rowed corolla of Napoleona, which much resembles the coronet of a Passion-flower; but there the resemblance ceases. The tendrils, parietal placentæ, free ovary, distinct styles, polypetalous corolla, imbricated calyx of Passifloraceæ, are all most essentially at variance with the genus. Symplocaceæ were a far better guess, for the monopetalous corolla, indefinite epipetalous stamens, axile placentæ, adherent calyx, and definite seeds of Napoleona find there a parallel; but the ovary of that genus is wholly adherent, with a great epigynous disk, the calyx is valvate, and the seeds have no albumen, to say nothing of the lacerated condition of the corolla, which is not to be wholly disregarded in a consideration of this kind. To me it appears that the true affinity is in the neighbourhood of the Mangroves (Rhizophoraceæ); for the following reasons:—The ovary is in both inferior, few-seeded, with axile placentæ; both have a coriaceous valvate calyx; both have large

amygdaloid seeds without albumen. The placenta of Kandelia is almost the same as that of Napoleona, and in the former genus the petals are broken up into numerous fringes quite analogous to those of the genus in question. To this may be added the great resemblance that exists between the wood of Napoleona and of young Rhizophora, in consequence of both consisting in part of slender acicular tubes, which give the wood, when broken across, the appearance of containing slender bristles. Finally, the ribbing, which is so conspicuous in the outer corolla of Napoleona, is repeated in the calyx of Bruguiera gymnorhiza. It is true that the one genus is monopetalous and the other polypetalous, but I cannot attribute much importance to that character in a case where the stamens adhere so slightly to the corolla. While, however, there is this reason to believe that Rhizophoraceæ will prove most nearly related to Napoleona, the affinity of the genus to some Myrtaceæ is not to be overlooked; as, for example, to Verticordias, in which there is the same tendency to a multiplication of the series of the corolla, to Careyas, whose fruit has a very similar structure, and to Barringtonias to which Napoleona is very similar in foliage; but these affinities are less striking than that of the Mangrove tribe. They show, however, pretty clearly that Belvisiaceæ, for so it is most convenient to call the Order of which Napoleona, is the most conspicuous member, belongs to the great Myrtal alliance."

The following are the parts illustrated in the preceding cut, beginning at top on the left:—1. A flower-bud just expanding. 2. The fleshy cup, and table-shaped stigma. 3. An expanded flower of the natural size. 4. A perpendicular section of the same. (In this the artist has carelessly added a fourth ring to the corolla on the outside of the stamens; no such ring exists.) 5. A perpendicular section of the ovary. 6. An ovule. 7. Aripe seed. 8. A stamen. 9. A transverse section of the ovary.

Home Correspondence.

Planting Forest Trees.—In laying out a new plantation it is usual for the proprietor to name what sorts of trees he intends eventually to become permanent timber; generally, and I regret to say too often, Oak is selected for that purpose, let the soil and situation be what it may. Sometimes, however, Ash, Elm, or Beech, with here and there a Silver Fir, are the kinds intended ultimately to stand; but whatever may be the sorts planted for large timber trees, there usually is, and there always ought to be, a number of some other kinds planted, to act as nurses to the more useful but slower-growing favourites. Before commencing planting I should recommend the ground to be put in order; for, rely upon it no after attention will compensate for the loss of time and trees, if they are not properly attended to at first planting. The method which I have seen adopted with the greatest success is to plant ground that had undergone a course of husbandry; plant in autumn, after the ground has been repeatedly ploughed and manured during the summer, similar to the way in which it is done for Wheat. This may, perhaps, be objected to on account of the expense, but I am convinced that it will repay the outlay. Very steep hill-sides and other places sometimes cannot be done in this way, and therefore must be planted by the spade in the usual way, taking care to remove all useless bushes and other rubbish likely to choke the trees. Another way of preparing the ground is by what is called bastard-trenching; that is, one spit deep and a shovelling. This mode is most applicable to pasture land, in which trees do very well, provided no clay, apt to produce canker, is brought to the top. As the kinds of trees to be planted must be regulated by the taste of the proprietor, the nature of the soil, and the local demand, it may suffice here to observe, that if the ground has been prepared as above they had better be small; 18 inches in height is quite sufficient, as they at that size root much better, and fewer failures happen, than when the trees are larger. I have never observed much difference in the results between planting in autumn and in spring. I imagine that many of the failures of spring planting may be attributed to the trees having been taken up in autumn and laid in by the heels all winter in large bundles, sometimes in the ground and sometimes out of it. I have planted trees that were in good condition as late as the end of March, with perfect success. It is better, however, not to be so late, as work left to that late period is sometimes hurriedly and imperfectly done, especially when there is a want of hands; but otherwise I can see no difference between autumn and spring planting. As regards the number of trees to be planted per acre, there is a great diversity of opinion; and many writers of late years have condemned the system of too thick planting, pointing out the deplorable condition of many fine woods which have been spoiled by so doing; whereas in fact the mischief lies not in the planting but in the after management. For my part, I would rather see trees planted too closely than too thinly; and, where coppice-wood is wanted, is it possible to have it too thickly planted? Where fine, straight, and useful Larch or Scotch Fir-trees are wanted, with as little difference as possible between the thickness near the top and that near the bottom, they cannot be obtained where they stand far apart; of course Fir-trees cannot be allowed to draw each other up where they are planted as nurses to other trees, and consequently must be thinned out when their presence becomes hurtful to their more tardy-growing neighbours. I may observe, that with ground prepared as above I usually plant about 3000 trees per acre, or sometimes fewer, being about four feet apart; and as the trees are small, they are not so expensive to purchase as a smaller number of larger trees. I am careful in planting to dig holes sufficiently large to contain the roots spread out neatly in a horizontal position, and I cover them with a little fine mould, and not with the stiff cloddy lumps which in dry weather are always at the top. If the plantation is of mixed trees, care must be taken to have them mixed regularly, and planted so as not to appear in lines in any direction. If they are planted in autumn, or even in spring, it is advisable to go over them in May and tread the earth around their stems, as by wind-waving they make a hole around each stem; in the month of June the ground will require to be gone all over with the hoe, and, if possible, another time during the summer. On the following autumn any deficiencies can be made up, and if the ground is once more hoed during the ensuing summer, the plantation will require little more attention beyond keeping up the fences and destroying rabbits and other vermin. By the end of the second summer, if the soil is good, the young trees will have made considerable progress; and if it is necessary go over the ground during the ensuing summer with a reaping-hook, and cut down Thistles and other tall weeds, for by this means the trees will be much benefited. I have said nothing of the kinds of trees most suitable for grouping together, as no definite rule can be laid down that will suit every case and locality; I may however observe, that Scotch Firs do best planted wholly by themselves, and they should not stand more than four feet apart—even closer would be better; but I fear I am venturing upon dangerous ground, as it will be said that as a certain space of land can only produce a certain quantity of organisable matter and no more, too many trees will impoverish each other. I cannot, however, see that a medium number of trees will impoverish the soil more than a small number of trees, and a great deal of herbage and other rubbish. Again, we are told that trees planted so closely, which remain so for a few years, draw each other up, and are consequently spoiled. This, I admit, is often the case where Scotch and other Firs are planted amongst hard wood, but where Scotch Firs are planted by themselves, and for profit, they ought to stand eight or ten years before they are touched, or until they get from 12 to 16 feet in height. Every wood-merchant well knows that Fir-trees taken from detached places, or from thin plantations, are coarse, knotty, and short, compared with those taken from a close plantation, and the latter consequently fetch a much higher price.—*S. N. V.*

Nerquis Plantations.—It is rather singular that I should be the only person, for a space of nearly 40 years, who has differed on the spot, and in his presence, from Dr. Thackeray, about the management of his plantations at Nerquis. But my object in visiting them was to see them and judge for myself; and, perhaps, I had a better opportunity of inspecting them, and forming an unbiassed judgment, than any of those eminent men, from all parts, who had never seen more flourishing plantations in their lives. I had a thorough ramble of 4 or 5 hours, through them with Mr. Roberts (Dr. Thackeray's man), before that gentleman came, when I went and examined places where gentlemen on horseback could not go. I observed to Mr. Roberts that they had not begun to thin out the Larch and other things for a length of time after these had been planted, which he admitted to be the case. I also remarked, that the Oaks and Ash had been retarded in their growth for want of thinning out the Larch, &c., in time, and he admitted it was so, observing that one could not have seen a large object, a horse, for instance, at a little distance from the rides, the woods were so thick. In some other parts I observed that the plants had been nearly all destroyed and retarded in their growth, during their infancy, by the overgrowth of Gorze, &c., to which he assented. I also noticed some younger plantations in a neglected state; when I asked him the cause of this seeming neglect, saying, that the Doctor's delight was in his plantations, he replied, that he did not like to put the Doctor to the expense. Now although all this passed, and although Mr. Roberts agreed with me in every respect while on the spot, yet he writes quite the contrary, and misrepresents much that did pass when the Doctor and the other persons were present. He writes, "Mr. Billington says the Oak and Ash are not fine trees;" yet I have said that there were certainly "some very fine Oaks and Ashes near the rides, although not what they might have been under a better system, but that the greater part are not so." And further he states, that I have selected fine, well-grown trees in a better soil and climate as a contrast; but has omitted to state that I mentioned a young plantation of Larches, of 35 years' growth, in a very favourable soil and climate, that was greatly retarded in their increase of bulk in the stem, by being pruned on Dr. Thackeray's system. That striking example of the bad effects of divesting trees of their branches adjoins the place where the magnificent Cedar of Lebanon grows, at the Hayes, near Oswestry, and is near the place where the noble Larch, of about 40 years' growth, in Mr. Gore's plantation, is growing. Very soon after we had met with Dr. Thackeray, and had entered the plantations again, I expressed my opinion of the woods. He said that I only looked at the worst trees. I replied that I must look at the worst as well as the best, in order to form a correct judgment. I then asked the Doctor how the timber was increased in the stem; he replied that he did not know. I said, was it from the top downwards, or from the bottom upwards? he said from the bottom upwards; and, pointing to a Spruce Fir that had been pruned, and that was oozing out sap, remarked that it was increased somehow by the ascending sap; and so confident was he in that opinion, that he repeatedly said I was wrong, nor could I get him to listen to what I believe to be the true cause of the increase of timber in the branches and stem, viz., the descending filaments or woody tissue from the annual leaf-buds and shoots. This is not theory, but a fact which has been proved to be correct, by experiments and observations made by myself many years ago. It is evident that the Doctor imagines that the timber is increased by the ascending sap from the roots upwards, and that the nutriment is derived entirely by the roots from the soil. I would recommend any unbiassed and competent person, who makes an inspection of these plantations, and reports on their appearance, and on the system of pruning practised at Nerquis, to go as I did, by himself, or with Mr. Roberts, not only through the "show parts," but through the whole of them; and I feel satisfied that I may leave the result to himself.—*W. Billington.*

Pruning Forest Trees.—Having observed in the *Chronicle* several papers on this subject, I beg to offer the following remarks; first, as to the object desired, which, as far as hedge-row timber is concerned, is generally a double one, viz., to prevent the tree from occupying too large a space either by root or branch, and thus injuring the crop of the farmer; in this point of view almost all pruning is beneficial. The next, to compel the tree to form wood of increased value. By confining the growth to the stem, and thus obtaining a large girth for this purpose, large branches are frequently cut away, and the top alone is left to increase. The result to any thinking mind must be apparent; the wounds do not heal, and when the timber is cut it proves unsound (I was told by a person of considerable experience, at a loss of 10 per cent. to the value) and the top ceases to grow, shoots being thrown out all round the tree, to be cut away when large by the farmer, who gets in faggots what the owner of the soil would otherwise get in timber, or if left long enough, to re-form large branches and make the tree, in the course of years, of the same shape as that it originally bore, though not so large as it would have been. I have seen a whole side of a park destroyed by an ignorant wood-cutter by these means. He seemed to have forgotten that Nature has appointed the growth of trees to be different, according to their different situations; the hedge-row tree requires defence against wind; its branches are therefore thickly set, its form conical, its growth slim, its wood hard and knotty; it cannot be made to grow otherwise, though the knife may put it in another shape. The tree of the wood, surrounded by its compeers, struggles to display its foliage to the air; it attains in height what it loses in spread, and though not hard, so as to support friction when manufactured, yet it has gained in length of fibre and elasticity; the sap ascends with greater freedom than in the exposed tree; and the large dimension of the girth proves its rapid growth; let, however, this tree be too closely surrounded by others, and the result will, in a measure, be the same as would arise from pruning; a sufficient quantity of working wood not being in action, the healthiness of the tree will be lost. If, therefore, the cultivator desires to have his trees healthy in the open field let him leave them unpruned; if in plantations, let him look to the thinning, always keeping the healthiest plants, and having a careful eye to future removals, giving to each tree the utmost protection possible, by means of those that surround it, yet leaving it a sufficient spread of foliage to carry on those operations of nature, which in this instance cannot be interfered with without disappointment as to the very object sought to be gained. If he be a planter let him plant such trees as the soil agrees with; if he wishes for a variety, let him plant in some degree alternately, and he can then choose which trees he will keep; but ye with the knives—

——— "Procul oh procul este profani
Totoque absistite luco."

—*Rhodon.*

Destruction of the Mealy-Bug.—This is one of the most formidable enemies with which a gardener has to contend, and persons are often inquiring by what means it may be extirpated without injury to vegetation. I have often seen a solution of soft soap, and soft soap and sulphur recommended; and this is perfectly efficacious if repeatedly and carefully applied; for instance:—Take a leaf with some of these pests on it, and smear it over with soft soap and sulphur, and it will almost immediately kill the insects. On account of the Mealy-bug, however, secreting itself and its larvæ in very small chinks and crevices, it is difficult to destroy it; and this appears to me to set at defiance all attempts to extirpate it with one or two dressings, without recourse to something injurious to vegetation. I am quite satisfied, however, that it may be got rid of by persevering in the use of a solution of soft soap and sulphur lukewarm, and applied with a painter's brush, rubbing it well into the crevices. Pines may be more easily cleared by the vapour of hot dung.—*William Jones, Beddington, Surrey.*

Mealy-Bug, Thrips, and Red-Spider.—It is a source of pleasure to me, in common with other gardeners, that so simple a means of destroying the Thrips and Red-spider as is mentioned pp. 749 and 765, has been discovered. I have no doubt that this discovery will lead to important results, and that, at no distant period, a remedy equally simple with bruised Laurel-leaves will be found for destroying the Mealy-bug, and that the whole will be rendered applicable to our largest plant-houses. My attention has for some years past been directed to this object, but all that could be desired is far from being yet accomplished. I have, however, been able to concoct a lotion, which, although rather tedious to apply, is superior to the old method of taking the insects off with the point of a knife, which never destroyed the million of eggs; or of washing with soap and water, which, to

tender-leaved plants, often did as much injury as the insects themselves, to say nothing of the time occupied in performing these operations. With my dilution, it is only requisite, with a camel-hair pencil, to touch the infested parts; the liquid at once penetrates their bodies, and immediately destroys both parents and embryo young. I have no doubt, if the matter was taken up in good earnest, that in one season these pests to our plants could be extirpated from every collection in the land.—*Samuel Hereman, Florist, &c., Eltham, Kent.*

Morphology.—With this communication I have sent two curious Fuchsia-flowers, which were cut from a fine collection of those plants belonging to Mr. Kendall, florist, Stoke Newington. One is Vesta, and the other Gigantea. The first, as will be seen, is a flower growing out of a leaf; the second a leaf growing out of a flower. There is also in Mr. K.'s houses, amongst several productions of this kind, an unexpanded bloom, having small leaves in the place of sepals. This, in a Fuchsia, may be considered extraordinary; but when it is observed that Mr. K. is enabled to continue the propagation of them throughout the winter by perpetuating a supply of the agents essential to the production of organisable matter, and consequently vigorous growth, with his inability of supplying the one agent upon which the development of the highest organs of plants mainly depends, namely, solar light; and as the power of this gradually becomes less at this time of the year, it is not very surprising that the plant, instead of ceasing at once to form the higher, and producing nothing but the lower organs, should exhibit some of an intermediate character; of course where the decline of heat and light are coincident, as in the open air this is not so likely to happen.—*W. Sherwood.*

Tank-heating.—My tank is made of wood, and covered with flat tiles, similar to those used for roofing, and only mortared at the joints; over the tiles is placed about 8 inches of sand, in which pots are plunged. I find that the tiles give out too much moisture and cause small plants to damp off. I would not recommend the plan which I have tried, of using a bent pipe to heat a tank, as proposed by one of your correspondents. The disadvantage is, that it obliges a fire constantly to be kept up to keep the water (100 gallons) even at the temperature of 90°. Some advertisers of boilers state that attention to the furnace in 10 or 12 hours is sufficient; but with mine a moderate firing will not do. In the part of the pit intended for forcing, I have tried a few things; but I consider that a few inches of rubbish should be put on the tiles to form a good drainage, and then about a foot more of mould. The furnace-door is within the pit, and although the flue draws well, still, supplying fuel and clearing out ashes, &c., cause much dust, which I imagine injured my first crop of Cucumbers. The pit is covered with varnished linen, and retains much moisture from the moist heat from the tank. The well-established and old plants still look well; but cuttings, for which the propagating pit was intended, evidently are not doing well.—*G. C.*

Jealousy and Ferocity of the Redbreast.—I had lately an opportunity, unsought, of testing, in the most satisfactory manner, the jealousy and ferocity of the robin. It is not generally known to how dire an extent the jealousy of this bird will go. Frequent as is the sight in the human species, hardly less so is it in the feathered tribe, some of whose members, although not exceeding a quarter of an ounce in weight, are scarcely less ferocious while under the influence of the "green-eyed monster" than the fair sex. I was in the garden, going through a variety of performances with my favourite robin, who, although (as I have before recorded in your columns) in a wild state, and at perfect liberty to roam wherever his fancy bids him, is with me and my family a constant guest, sleeping in Ravenscourt Park by night, and dropping in to breakfast in the morning. I was standing upright on the lawn, holding a mealworm closely pressed in the middle between my finger and forehead, with a view to my pet coming for it as usual, taking for his *locus standi* the apex of my nose. Honouring my invitation, he quickly took his accustomed seat. While, however, he was flirting with the worm, another robin—who, no doubt, from a neighbouring tree had been watching us narrowly—suddenly darted across my face, and with the rapidity of lightning hurled my *protegé* to the ground, to my astonishment, and to his infinite discomfiture. The jealous rage depicted in the countenance of the conqueror (whose feathers were distended to their utmost limit as he stood erect over his prostrate foe) I shall never forget. It was what Dante would have called "infernal." It is worthy of remark, that before this occurrence, no strange robin had ventured, bodily, into the precincts of my domain, the whole tribe being kept at bay by the one who constituted himself "cock of the walk," as is always the case after the month of September. From that period until spring, each robin confines himself to an allotted space, beyond which, though his song is everywhere heard, he is seldom allowed to venture; or, if he does, he retires precipitately, well knowing he will be speedily driven back with damage. In his own territory he is, like Selkirk,

"Monarch of all he surveys,"

and there he boldly asserts his rights; but when on strange ground, he almost invariably shows the white feather, and sculks home abashed. It is grievous to have to record such unamiable traits in the character of this otherwise noble bird, but truth demands it. The redbreast has been since caught and caged; the consequence of which is, that my old favourite, finding his adversary gone, has at once appropriated to himself the double domain, and taken permanent possession of two entire gardens, with sole right of *entrée* to my dwelling and its domestic circle of inmates. This, I lament to say, is the last year of his life. Next season he will have attained his full age (4 years), and fall a victim, as these birds invariably do when old, to the desperate assaults that will be committed upon him by the young of his own tribe. He will die without a wish or effort to survive his allotted time!—*William Kidd, New-road, Hammersmith.*

Scotch Leadington Apple.—I beg to state that I have in my garden an Apple-tree called, in this part of the country, the Scotch Leadington, which has borne, the year before last and this year, so large a quantity of fruit that I think it worthy of attention. In the year 1842 it had upon it, carefully measured, twenty-five bushels, each bushel averaging 420 Apples, making the enormous quantity of 10,500 Apples. Last year it had a very deficient crop, but this year it has produced 8864 Apples. The Apples have been measured and counted twice over, so that there can be no mistake. This singularly fruitful tree was planted 56 years ago, by my faithful old (now-pensioned) gardener, Mr. Porter, who, 83 years of age, assisted this year in relieving the tree of its heavy burthen. It is a good keeper and a good baker. Its height is 19 feet, and the circumference of the branches 95 feet. It stands in a strong tenacious soil, 550 feet above the level of the sea.—*H. Le Maire Witham, Lartington Hall, Yorkshire.*

Pears.—The following is an account of the weight of Pears grown here this season, viz.—

Easter Beurré . .	10 oz	Gansell's Bergamot .	10 oz
Swan's Egg . .	5½	Jargonelle . . .	7
La Bonne Milanoise .	4½	Summer Bergamot .	4½
Glout Morceau . .	8	Rousselet . . .	5
Napoleon . . .	6	Brown Beurré . .	8
Marie Louise . .	11	Colmar . . .	6

—*G. J., Woolwich.*

Brewing.—I beg to inform "Ignoramus," that it is not necessary to boil the wort in order to make good beer, if he boils the Hops in the water, and strains them into the mash-tub; allow the liquid to remain the usual time on the malt, and then lets it run off. Put the Hops back again into the copper with more water, boil and strain them as before, and do the same again, if required. In this way, both a saving of fuel and labour is effected. A friend of mine, a farmer in Gloucestershire, makes all his beer in this way, but it is not kept for any very great length of time.—*Sandfordenstone.*

Miscellaneous.—*Memet* remarks, in regard to the shanking of "An Amateur's" Grapes, that air given early in the morning would possibly prevent the evil, which he imagines is caused by moisture collecting and hanging on the stalks of the berries in a warm and confined atmosphere. He further observes that the Vines should not be allowed to produce an over abundance of fruit.——*J. G.* states that he quite agrees with the opinion of "Dodman" (p. 766), respecting the culture and management of Pears; he has generally found that Pears keep better and are better flavoured if gathered when sufficiently matured, and not allowed to remain too long on the tree; he refers principally to winter fruit. ——*Mr. Petty*, gardener to Lord Bexley, corroborates the statement of "W. D. S." (p. 766), regarding the excellence of Cormack's British Queen Pea. He states that for a general crop it is superior to all others. Cormack's Prince Albert Pea, he says, was the earliest with him; he gathered a dish from it on the 8th of May. Finally, he adds that both sorts were had direct from the party who introduced them, and that he can vouch for their being the true varieties.——*Querist* inquires of Mr. M'Donald (p. 765), what sort of Melon Pitt's Improved Egyptian Green-fleshed is, and whether that is not a hybrid?

COUNTRY SHOWS.

Chislehurst Cottagers' Vegetable and Fruit Show, Nov. 13.—This Show, established by Mr. Barnes, of Bicton, and patronised by the nobility and gentry of the parish, held its sixth annual meeting, under the management of Messrs. Wilson, Salter, Emery, and Peckham. The productions exceeded the most sanguine expectations. The Prizes were awarded as follows:—*Collections* of 6 sorts of Vegetables, including 3 heads of Celery, 3 of Cabbages, 12 Onions, 6 Carrots, 6 Parsnips, and 12 Potatoes: 1st, Mr. King; 2d, Mr. Wain; 3d, Mr. Asher; and 4th, Mr. Blackman. 12 *Onions*: 1st, Mr. King; 2d, Mr. Weeks; 3d, Mr. Peters; and 4th, Mr. Willis. 12 *Potatoes*: 1st, Mr. Palmer; 2d, Mr. King; 3d, Mr. James, and 4th, Mr. Blackman. 6 *Turnips*: 1st, Mr. Willis; 2d, Mr. King; and 3d, Mr. Elliott. 6 *Carrots*: 1st, Mr. Peters; 2d, Mr. Callow; and 3d, Mr. Willis. 6 *Parsnips*: 1st, Mr. King; 2d, Mr. Weeks; and 3d, Mr. Peters. 3 *Cabbages*: 1st, Mr. Dean; 2d, Mr. Wells; and 3d, Mr. King. 3 *Savoys*: 1st, Mr. Asher; 2d, Mr. Dean; 3d, Mr. King; and 4th, Mr. Callows. 3 *Heads of Celery*: 1st, Mr. King; 2d, Mr. Asher; 3d, Mr. Dean; and 4th, Mr. James. 3 *Kale*: 1st, Mr. Wells; 2d, Mr. Gimson; 3d, Mr. Asher; and 4th, Mr. Callow. 6 *Leeks*: 1st, Mr. Asher; 2d, Mr. Gimson; and 3d, Mr. Wells. *Collection of Herbs*: 1st, Mr. Wain; 2d, Mr. Asher; and 3d, Mrs. Dean. 12 *Apples*: 1st, Mr. Fuller: 2d, Mr. Asher; 3d, Mr. Willis, and 4th, Mrs. Stowe. 6 *Pears*: Mrs. Dean. Several extra Prizes were also awarded. The Innkeeper, Mr. J. Pugh, by his exertions contributed greatly to the comfort, convenience, and general satisfaction of both visitors and exhibitors, and served a comfortable dinner, to which most of the respectable inhabitants sat down.

North British Professional Gardeners' Society, Nov. 6.—At this, the last meeting for the season, prizes were awarded as follows:—*Chrysanthemums*: Mr. J. Addison for Lucidum, Princess Maria, Gem, Queen, Marchioness, and Triumphant. *Camellias*: Mr. R. Watson, for Press's Eclipse, Gloria Mundi, and Tricolor. *Orchidaceæ*: Mr. G. Stirling, for Epidendrum ciliare, E. cochleatum, and Leparis foliosa. *Exotics*: Mr. Stirling, for Passiflora racemosa, Tacsonia pinnatistipula, Eranthemum pulchellum, Phœnocoma prolifera, Strelitzia reginæ, and Erythrolæna conspicua. *Ericas*: Mr. D. Foulis, for Hartnelli, retorta, and Shannoniana. *Desert Apples*: Mr. Young, for Ribston Pippin, Hollow-eyed Pippin, and Borsdorffer. *Desert Pears*: Mr. Young, for Gansel's Bergamot, Marie Louise, and Louis Bonne (of Jersey). *Celery*: Mr. J. Goodale, for Goodale's Broad White and Manchester Red. *Brussels Sprouts*: 1, Mr. Thom; 2, Mr. Downie. *Leeks*: 1, Mr. Thom, for Scotch Flag; 2, Mr. J. Douglas. *Endive*: 1, Mr. Stirling; 2, Mr. Addison. *Cauliflower*: 1, Mr. Addison; 2, Mr. Douglas. *German Greens*: 1, Mr. Downie; 2, Mr. Thom. *Curled Parsley*: 1, Mr. Addison; 2, Mr. Stirling. *Onions*: 1, Mr. Goodale; 2, Mr. Douglas.

Nottingham Potato Show, Nov. 13.—This was the first Show of this Society, which has lately been formed here; the novelty of the Exhibition induced many influential and respectable persons to visit it, and the general opinion was that such Societies were likely to become numerous, and to be of the greatest benefit in improving the growth of this most valuable vegetable. Many expressed themselves in terms of the warmest admiration, and almost unsolicited, enrolled themselves Members for next year. The following prizes were awarded:—1, Early Albany, or Ash-leaved Kidney, Mr. Briggs; 2, ditto, Mr. J. Spencer; 3, Arlesford Seedling, Mr. Spencer. *Second Early*: Newark Seedling, Mr. Briggs; 2, Leicester Red, Mr. Spencer; 3, Brouton Dwarf, Mr. Spencer. *Late*: 1, Bread-fruit, Mr. Green; 2, Cheltenham, Mr. Briggs; 3, Farmer's Profit, Mr. Spencer.

Reviews.

Dialogues on Instinct, with an Analytical Review of Researches on Fossil Osteology. By Henry Lord Brougham.

THIS is the 19th of the series of Mr. Knight's "Weekly Volume for all Readers," and here we have the contents of a portly octavo for a shilling. We cannot commend too highly this attempt of Mr. Knight to place in the hands of all who can read, a series of volumes which, from the character of those already published, cannot fail to elevate the taste and expand the mind.

The volume now before us was published some years ago by Lord Brougham, as one of the supplements to an edition of "Paley's Natural Theology," in five volumes, by himself and the late Sir Charles Bell. No subject is, perhaps, so fertile of illustrations which cannot fail to arrest the attention and excite the interest of the most apathetic, as that of animal instinct. Every one is familiar, whether shut up in cities, or living in the free air of the country, with instances of instinct; and all our books on animals make us acquainted with its operations in every class. Still the question must occur to those who begin to inquire upon the subject of instinct, and to compare its results with other phenomena—What is its real nature? And this is frequently a much less inviting subject than the observation of the facts to which the word instinct is given. It is this question that Lord Brougham attempts to answer in this volume, which is rather a metaphysical discussion on the nature of instinct than a detail of its more interesting developments. The discussion of the question is carried on in the form of a dialogue, in which Lord Brougham and Lord Althorp are supposed to be the interlocutors. The first dialogue consists of a statement of facts and a definition of instinct. In order to give a clear idea of the subject to be discussed, his lordship divides instinct into *physical* and *mental*, and in the former term includes all those motions which are involuntary, such as the motion of the heart, the performance of secretion, and other functions of the animal body. These functions have sometimes been confounded with instinct, but would, perhaps, be more properly referred to *vital power* generally, and thus comprehend similar actions in plants. This point being settled, the debaters proceed to the subject of mental instinct, or instinct proper, and endeavour to find a definition for it independent of reason. The result is, that instinct is that faculty which "acts without teaching either from others—that is instruction, or from the animal itself—that is experience.*** It acts without a knowledge of consequences,—it acts blindly, and accomplishes a purpose of which the animal is ignorant."

In the second chapter the theories of instinct are discussed; and here the difficulty of distinguishing between the reason of man, and many of the acts resulting from the action of the mind of animals is made apparent. If a knowledge of the ends to be obtained by certain actions, be the character of intelligence, of reason, then it is possessed by animals as well as man. The bee collects wax and constructs its cell, fills it with honey, but it knows not why or wherefore, and this is instinct. But let us take the instance of Hüber's humble bees referred to in Green's "Vital Dynamics:"—"A dozen of these were put under a bell-glass along with a comb of about ten silken cocoons, so unequal in height as not to be capable of standing steadily; to remedy this, two or three of the humble-bees got upon the comb, stretched themselves over its edge, and with their head downwards fixed their fore-feet on the table on which the comb stood, and so with their hind-feet kept the comb from falling; when these were weary others took their places." In this way these insects supported the comb for three days, till they had formed pillars of wax capable of supporting it. Now this is something more than instinct—it is animal intelligence, and of the same nature as the understanding in man. Then on what do instinctive operations depend? Descartes supposed they were the result of the machinery of the organisation; but this theory is rejected, and the dialogue thus proceeds:—

"*B.* We may therefore, I conceive, pass over this theory altogether. But another and a greater man has been so pressed with the difficulties of the subject, that he has recourse to a very different supposition, and instead of holding the Deity to have created brutes as machines without any mind at all, he considers their whole actions as the constant, direct, and immediate operation of the Deity himself. Such is the doctrine of Sir Isaac Newton, which is saying enough to prevent any one from hastily rejecting it, or rashly forming his opinion against it.

"*A.* Does he not mean merely to derive the actions of brutes from a perpetually superintending and sustaining power of the Deity, as we ascribe the motions of the heavenly bodies to the same constantly existing influence?

He probably only means that the brute mind, having been created, is as much under the Divine governance as the material powers, qualities, and motions are; in other words, that mind was created, and matter was created; and that still the actions and passions of both are constantly under the guidance of the Creator. So that Sir Isaac Newton would no more deny the separate existence of the minds of brutes, than he would the separate existence of their bodies, or of the heavenly bodies.

"*B.* Here are his own words. The passage occurs in the famous 31st Query, or General Scholium to the Optics; and you see that, after recounting the structure of animal bodies as proofs of design, he adds, 'And the instinct of brutes and insects can be the effect of nothing else than the wisdom and skill of a powerful, ever-living agent, who, being in all places, is more able by his will to move the bodies within his boundless uniform sensorium, and thereby to form and reform the parts of the universe, than we are by our will to move the parts of our bodies.' He proceeds to guard the reader against a supposition of the Deity being the soul of the world, or of brutes, or of his being composed of members or parts, stating that he only 'governs and guides all matter by his prevailing power and will.' So that you see he draws the distinction between the mind or will of men, which influences the motions of their bodies, and the influence which moves brutes; plainly enough referring the latter to the Deity himself, as the *primum mobile*, or actuating principle; for he allows that the kind of ubiquity or universal action to which you refer applies to our bodies, and I presume to our minds also, which were created and are sustained by him."

The remainder of the dialogue is taken up with the defence of the view of Newton, and pointing out its bearing on natural theology. The necessity of admitting such an explanation at once, places us for ever in contact with God.

The two remaining dialogues are devoted to the facts and theory of animal intelligence. We have not space to pursue his lordship through the interesting discussions to which the facts give rise. Here are some quoted from the work of M. Virey.

"Thus the smallest bird, he says, can fly several leagues in an hour; the hawk goes commonly at the rate of a league in four minutes, or above 40 miles an hour. A falcon of Henry II. was flown from Fontainebleau, and found, by its ring, at Malta next day. One, sent from the Canaries to Andalusia, returned to Teneriffe in sixteen hours, a distance of nearly 700 miles, which it must have gone at the average rate of 21 miles an hour. Gulls go 700 miles out to sea and return daily; and Frigate-birds have been found at 1200 miles from any land. Upon their migration he states, as a known fact, that cranes go and return at the same date, without the least regard to the state of the weather, which shows, no doubt, if true, a most peculiar instinct; but these, and, indeed, all facts which we find stated by a writer so addicted to painting and colouring, must be received with a degree of suspicion, for which no one but M. Virey is to be blamed. The accounts, however, of the swiftness of birds, I can well credit, from an experiment I made when travelling on a railway. While going at the rate of 30 miles an hour, I let fly a bee; it made its circles as usual, and surrounded us easily. Now, if there was no current of air or draught to bear it along, this indicated a rate of 90 miles an hour; and even allowing for a current, the swiftness must have been great. I should, however, wish to repeat this experiment before being quite sure of so great a swiftness in so small an insect."

The volume concludes with an abstract of Cuvier's work on Fossil Osteology. Although much ought to be added to bring this epitome up to the knowledge of the present day, it cannot fail to interest those who have any taste for the study of geology. These productions of Lord Brougham's pen must convince every one of the vastly discursive power of his mind. He cannot, however, be regarded as an authority upon the subjects on which he treats in this book, as he is too much the scholar, and too little of the naturalist, to give weight to his judgment in matters involving a knowledge of the structure and functions of the organic kingdoms of nature.

The Florists' Journal and Gardeners' Record
No. 63. November.

This well-conducted and cheap periodical keeps up its reputation. The contents of the present Number are good and well-timed. The embellishments are usually well got out; but, in the present instance, we object to the representation of that pretty Pelargonium, Lyne's Princess Alice, as being very incorrect in form. White Perfection we have not seen.

The Illustrated London Almanack. 1845.

This is one of the many attempts to substitute something rational for the foolish almanacks of times that are passing away—and, we may add, one of the most successful. It is filled with illustrations, some of which, representing the signs of the Zodiac, are executed with considerable artistical taste. As it is chiefly devoted to the natural history of the months, it is just what the readers of the *Gardeners' Chronicle* are most likely to find useful. It is difficult to imagine anything cheaper.

Garden Memoranda.

Messrs. Chandler and Sons, Vauxhall.—The Chrysanthemums at this establishment are now in perfection, and we recommend every lover of these beautiful flowers not to lose the present opportunity of seeing them; for notwithstanding the unfavourable season, there is a fine display of bloom, and a visit to the nursery will be amply repaid by a sight of the collection. This season is rather barren of new varieties, and few will be found among the introductions of the present year to enrich a fine collection; but though few, we consider the Queen of the Yellows, a rich yellow buff; Annie Salter, a clear pure yellow; and the Queen of the Gypsies, orange buff, as distinct and fine flowers well worthy of cultivation. Among the older varieties we noticed very fine specimens of Defiance, Victory, and Invincible, among the whites, and those which approach the whites, such as Celestial, Mirabile, &c., as being remarkably fine flowers, finely developed and the plants having splendid heads of bloom. Marshal Soult and David among the pure yellows were conspicuous from their compact and finely formed flowers, and among the changes to orange and buff, with the mixtures approaching the rich browns, there are some large and fine flowers; Incomparable is a very fine buff; Irene, Imogene, and Demosthenes, are desirable varieties; and Aristides, bright orange and brown, is a very handsome flower; Isolier and Phidias, though rather small, are distinct and desirable, being of a rosy red, and blooming freely. To this class of colours should be added Anne Jane and Count d'Eu, being both excellent sorts for a collection; Louis-Philippe proves a decided acquisition to the lilac or purple class, and the flowers are very superior to those of last season; Marshal de Crequi, though small, is a very desirable variety—it blossoms most abundantly, and undergoes changes in its progress to the perfect bloom, which are very pleasing; General Laborde is another fine compact flower, worthy attention. These we have noticed were varieties conspicuous for their fine colour and freedom in blooming; but the whole collection is well worthy attention. The Camellias are looking remarkably well, and promise an abundance of bloom.

T. A. Phillips's, Esq., Thornfield.—There is in the Pine-stove at this place a Sierra Leone Pine-apple, which measures 19½ inches in circumference, and 11½ inches in length. This variety is said to attain here the same weight as the Montserrat and Jamaica. I presume that it will not weigh less than 8 or 9 lbs. It is planted out into the bed. This fine fruit is in my opinion much superior to one of a New Providence which I saw cut, and which weighed 11 lbs. 8 oz.; and I trust that those who have doubted the possibility of accomplishing such a result will not lose the opportunity of seeing it. Although large and well formed Pine-apples are often produced at Thornfield, yet this is not the result of wide planting; on the contrary, the plants are crowded even to excess. In a pit 23 feet in length and 7 feet in width, there are now growing 60 plants, from which Mr. Hamilton says that he will, in all probability, cut a second crop next year of 250 lbs. of fruit.—*R. H.*

Miscelianeous.

Borax in Bread—One of the means employed to give bread made of bad meal a good appearance, is borax. According to Davillé, the bakers use about 4 oz. of borax to 100 lbs. of flour. To detect the borax in the bread, a considerable quantity should be extracted with water, the filtered extract clarified by boiling with albumen, and strained; upon this concentrated sulphuric acid is added while stirring, and it is then placed aside. If borax is present, crystals of boracic acid separate, which are now readily detected by their well-known reactions.—*Chemical Gazette.*

Chinese Ice-houses.—The ice-houses around Ningpo, and especially on the banks of the river between that city and Chinhae, are beyond calculation. They are built above the ground, and generally upon a platform of earth raised so as to be above the level of the surrounding fields. Upon such a mound a bamboo frame is thrown, which is well and closely thatched with paddy straw. The ice is collected in tanks or ponds, which the proprietors of the ice-houses take care to keep duly filled with water during the winter season. When the ice is of sufficient thickness they collect it; and, as it is brought in, each layer is covered with dry straw, and in this manner the ice is preserved during the whole summer. Each house has its own drain, to draw off the water caused by the melting of the ice. The article is not used in Ningpo for private consumption, but solely as an antiseptic for flesh and fish during the heats of summer. The inhabitants know nothing of the mode of cooling their liquid, except as they have observed foreigners use it for that purpose, and then they are very willing to retail it to them at the rate of about 80 to 100 cash per bucket, a charge by no means excessive during the dog-days. In places like Foochow-foo, the seat of Chinese luxury, ice is occasionally used to cool fruits, sweetmeats, &c.—*Friend of China.*

CALENDAR OF OPERATIONS
For the ensuing Week.

I.—HOTHOUSE CONSERVATORIES, &c.

Orchidaceæ.—A mild moist November, with little sun, like the present, is much in favour of these plants, as they go more gradually to rest, watering and strong fires not being necessary. The evergreen sorts are, however, more likely to suffer when clear frosty weather comes, more particularly those suspended from the roof, &c.; therefore it is a good rule to lower the suspended ones as much as is convenient, for two or three months in winter, the temperature being always more under in the body of the house than up near the glass; this may also be of some little advantage to them.

Conservatory.—It is now time to prune all the young shoots of Mandevilla, and you may strike the remaining cuttings, but the long slender branches had better be left on to the spring. If it is closely pruned now, it may begin to grow too soon, for any useful purpose, and stopping the young shoots does not answer well. Ipomœa Learii and fistulosa should be pruned in the same way, as soon as their leaves begin to turn yellow; the latter cannot be made to flower before the end of September, when planted out in a border; therefore April is time enough to give it the final pruning. The former, on the other hand, will flower by the middle or end of May, if closely pruned now. When pruned in February, it flowers about midsummer, and if cut in April, a month later. Both these useful climbers succeed much better in a large conservatory, with a fixed roof, than in a stove or intermediate house. Ipomœa tyrianthina should not receive any pruning till March, as it grows later than the other two. Passion flowers, unless they are much crowded, need not be pruned or thinned until January. Few climbers repay one's care better than Passion-flowers, but they are often left so thick as to completely do away with their native gracefulness.

Pits, &c.—This has been a dull unfavourable month for forcing plants, and many things will be later than they were last season; but to make up for this, hardy plants, such as Lilacs, Rhododendrons, &c., are in better bud than usual. We have had no use for strong fires yet, and in this cloudy weather much less watering and syringing is necessary. It is a dangerous practice to force hard till after the end of December; 60° with fire-heat is high enough for any useful purpose until that time.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.
Out-door Department.

I have been frequently upbraided during the autumn for not having mentioned some new plants which are likely to prove useful for flower garden purposes, the opinion of country gardeners appearing to be that, because a man resides near town, he must of necessity see something among new plants which may do for bedding out. Verbena speciosa, I imagine, will make an exceedingly fine bed, provided it can be induced to flower liberally; and as it seeds freely, there will be no difficulty in procuring plants. The plants should be strong, and dwarf at the time of turning out, as it is from the strongest shoots that it gets crazy blooms. Petunia cuneata is a plant from which much is expected by some cultivators, but being from tropical Africa, it is very doubtful whether it will make a fine group, except in very warm and favourable situations. It is very readily propagated by cuttings. Euthales macrophylla, being yellow, will be useful either for a large bed, or pegged down for a small one; it will require rather poor soil to make it flower profusely. Abronia coelestis, a plant which will probably be better known as the new shrubby Nolana will, doubtless, make a fine bed, but of its culture I can say nothing at present. The dwarf Phloxes, of which we have now so nice a collection, will be more in demand next season; but the plants in which I place the greatest confidence for a new feature in the flower garden, are Mr. Girling's Petunias, and others which have been noticed during the season in this Paper; some of them are exceedingly beautiful.—*W. P. A.*

IV.—PINERIES, VINERIES, &c.

Pineries.—The roots of Pines cannot be allowed to stop growing for want of heat, without receiving injury. It appears that they cannot remain stationary, but must be either advancing in growth or decaying. Sufficient bottom-heat should be maintained to keep them slowly advancing throughout the winter; from 80° to 85° will be found to suit both the fruiting and succession plants. If this heat is steadily maintained, and the roots kept rather dry than moist, they will be kept in a healthy state through the winter, which is a great desideratum in Pine-growing.

Vineries.—In starting Vines by means of fermenting matter, laid within the house, a considerable proportion of leaves should be mixed with the dung, to prevent the steam from the latter from discolouring the rafters and sashes; or if the vapour is likely to be too strong, a thin covering of old tan will prevent any injurious effects. Should the weather continue mild, it will be necessary to open the ventilators, so that the temperature may not exceed 60° for the first eight or ten days. Wrap some coarse Moss round the stems of the Vines to where the bearing wood commences, and keep the Moss moist, in order to prevent the stems from being dried up by the heat from the flues. In beginning to force Vines, it is unnecessary to give air till the buds are ready to expand into leaf. Frequent syringings must be resorted to when no fermenting material is used. If the roots are outside of the house, and if there is the litter of one horse at command, this, with a portion of leaves, will be sufficient to keep up a fine genial heat in the border, the results of which will be very evident in the progress of the Vines inside.

Peach-house.—It is not uncommon to see many of the buds of hearty trees drop off in a dry withered state, just after the fruit has been gathered. I will not say the border being too dry is the sole cause of this, but I believe it is often one cause. If the lights have been kept on the house during the autumn, look to the state of the border, and give it a sufficient watering. Keep the shoots moist by the frequent use of the syringe; it will rarely be necessary to give fire-heat during the winter season, till the blossoms are nearly expanding. Let the outside border be covered with litter.

Vines, Peaches, and Figs in Pots.—These should be plunged in old tan or leaves, either in an open shed or in a warm sheltered situation. Old tan or leaves are an excellent material for protecting the roots of plants in pots from frost. Let them be laid two or three inches above the rims of the pots, and covered over with old mats to keep them from blowing about.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Pruning and Nailing.—Proceed with these operations in all favourable weather, as, if wholly deferred until spring, the proper performance of them will be apt to interfere with other matters then demanding attention. If the trees were suitably attended to in summer, there will not be much useless matter to be removed now. Vines and Raspberries denuded previously of all unnecessary wood, had better have the shoots remaining left unshortened, until the rigour of winter shall have passed. The spurs of Currant trees should be cut in pretty closely to the stems, and the leading shoots considerably shortened, if quality rather than quantity is aimed at: Gooseberries may be treated in a similar manner, if the preferable method is not adopted of having the fruit produced chiefly on the young wood, or on the small spurs on wood of two or three years' growth. Apples and Pears against walls should have their fruit-bearing spurs kept as near the wall as possible, not only to secure the benefit of the wall, and prevent the unsightliness of long, rampant, overgrown spurs, but also for the obtaining of good-sized, well-flavoured fruit. Attention to the short spurs produced on good healthy trees when growing naturally as standards, will furnish a good lesson on this subject. In the case of some of our best sorts of Pears, which have a tendency to form a bold blossom-bud at the end of short shoots of the present year's growth, care should be taken to train a sufficient number of them, and, if long enough, to fasten them closely to the wall. *Plums* may be pruned much the same as Pears, but as the best fruit is generally produced on wood of two or three years' growth, care should be taken to train all the young wood every season. Those not much accustomed to nailing, are very apt either to cut shoots too short, or too many of them. Trees, especially young ones, are often irreparably ruined by the former, and much labour in rearing shoots by the latter. Comparatively few spurs will be necessary if placed alternately with a slight space upon the upper and lower sides of the shoot, and if the shoots upon the upper and lower sides of the shoot, and if the shoots upon the upper and lower sides of the shoot, and if the shoots

active vegetation may be retarded to a later period in the spring. Where thin tiles had been placed on part of the border next the wall, for the radiating of heat, and keeping the border moist, they may be removed, to prevent them from being broken by frost or the performance of the necessary operations; or if not considered too valuable, and if the draining was very defective, they might be bedded in clay, &c., to throw the water off the border. In extreme cases, advantage might be taken of the very useful plan advised for Vine borders in the forcing department of the Calendar a fortnight ago.

Shallots, Garlic, &c.—I generally find that these thrive best when planted about this season. The ground should be well trenched, and a place chosen where none of the Onion tribe had been grown for some time. Many failures arise from planting them too deep. They should merely be fixed on the surface, and then sprinkled over with a mixture of soot, lime, and ashes. The smaller variety is most prized by cooks generally; the large sort is easier grown, and produces more abundantly, but its flavour is considered deficient in what the admirers of the root term an "agreeable pungency." *Peas* and *Beans*. Make a first sowing of Prince Albert Pea, and Mazagan Bean, and sow them or other approved sorts again about the beginning or middle of next month. Those sown now will be useful if the weather should be favourable, and though they be cut down by frost it will only be the loss of the seed. Sow upon the breast of wide ridges, so that the young plants may be defended from east and north winds. Cover the seeds with chopped furze, Barley chaff, or sharp sand, as a protection from mice.—*R. F.*

VII.—COTTAGERS' GARDENS.

For those who are desirous of forming new plantations of Gooseberries and Currants, which should be done every six or seven years, young plants being found to produce more handsome fruit and also more plentifully than old ones, I would recommend from among the many varieties now cultivated, the following; viz., Yellow Sulphur, good and very early, but does not last long; Red Champagne, Taylor's Bright Venus, Pitmaston Green Gage, Red Warrington, Woodward's Whitesmith, Melling's Crown Bob, Farrow's Roaring Lion; and for preserving, the small Rough Red. Of Currants, the Black Naples, Red and White Dutch, and Knight's Large Red. In light soils, as soon as the present rainy weather shall have cleared off, and the ground become somewhat dry, the above may be planted with greater advantage than in spring. In preparing the ground let it be trenched to the depth of about two feet, thoroughly mixing with the surface spit a liberal allowance of manure or rich compost. About 5 feet square may be considered a proper distance at which the plants should stand in the rows. The pruning of Gooseberry and Currant bushes may now be proceeded with. Let the centre of the bushes be kept free and open cutting clean off any strong shoots that rise from that part. Cut out all branches that cross one another, leaving the leading shoots about 10 inches apart, and topping all that incline to the open space. All lateral twigs not required to form branches should be spurred in to a few buds. Black Currants require no pruning except thinning out the branches a little when the bushes have become large and thick wood. Plants in windows, &c. should not be watered in winter until they are quite dry, and then all the soil in the pots should be thoroughly wetted. If the pots are well drained the soil will only retain a certain quantity of water, and if that quantity is not given, a portion of the soil at the bottom—where the more active roots are—will become too dry. The plants will linger for a time, and ultimately perish for want of sufficient moisture, and yet the soil may appear wet enough on the surface. All the Salvias require this treatment except *S. patens*, whose tuberous roots require only to be stored in dry sand, or dry earth, while the tops are stored in a dry material they sometimes shrivel too much.—*J. Mell.*

State of the Weather near London for the week ending Nov. 21, 1844, as observed at the Horticultural Garden, Chiswick.

Nov.		Moon's Age	Barometer. Max	Min.	Thermometer. Max	Min.	Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 27th 1843—therm. 59°; and the lowest on the 29th, 1839—therm. 21°.

Notices to Correspondents.

Back Numbers of the Gardeners' Chronicle.—Many of the Numbers advertised last week having been since sold, we repeat the list of those which may still be had. Any subscriber who will forward to our publisher Post-office stamps equivalent to as many Numbers as are required, shall have them sent:—

1841:—1, 6, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34.
1842:—4, 6, 8, 11, 18, 30, 33, 42, 50, 51, 52, 53.
1843:—9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 38, 40, 41, 42, 43, 48, 50, 51.
1844:—All the Numbers for the present year; but parties are requested to complete their sets forthwith.

American Blight.—*K.*, *&c.*—Coal-tar naphtha will completely destroy the pest, if applied with perseverance.

Books.—*M. N.*—The most useful system of Botany for gardeners is, beyond all comparison, the Natural. Begin with Lindley's "School Botany," or Francis's "Favourites of the Flower-Garden," not cited by us at p. 53.——*A Novice.*—Mulsion of the booksellers.——*An Amateur.*—Sweet's "Greenhouse and Hothouse Cultivator."——*J. A. F.*—If you will favour Mr. Curtis, of Hayes, Middlesex, with your address, he will answer your inquiries.——*J. S.*—It is customary.

Boronia pinnata.—*George Matthews.*—Place your plant in an airy situation, and syringe it once a week with nitre dissolved in water, at the rate of 1 oz. to a gallon: if this does not destroy the mildew, dust the plant slightly over with flowers of sulphur.§

Calceolarias.—*F. N.*—Standish's Eclipse, and Standishii, Barnes's Bridesmaid, and Landmark; Green's Prince Albert, Sulphurea Superba, Miss Antrobus improved, Zebrina, Alba coccinea maxima, Royal Standard, Mary, and Holmes's Prince of Wales.*

Cherries.—*Dodman.*—Several of Büttner's Cherries have fruited in this country: one is entirely yellow; another a Black-heart, a very abundant bearer; and his October Morello is smaller, but much later than the common Morello. The Black heart, Kentish, and Black Eagle, are sorts likely to succeed in your soil. Others may be tried when you improve it.

Cinerarias.—*F. N.*—Beauty of Wortham, Black Knight, Captivation, Red Rover, Regina Victoria, and Henderson's No. 7.*

Decayed Leaves.—*A. W.*—Tree leaves from plantations where the ground is full of Dandelion, Ragwort, Chickweed, and other troublesome weeds, will, of course, swarm with their seeds; and although the leaves may be now getting hot, such seeds will not be so destroyed. You had better add gas-water to the heap; this will produce a violent heat, kill the weeds, rot the leaves, and improve their quality as manure.

Falling Leaves.—*Don.*—No doubt if people were to collect the falling leaves, and let them lie in water till entirely decayed, the liquid would be beneficial for watering plants with; more especially if it be soapy water that the leaves are laid in.

Fish Ponds.—*E. W. M.* enquires whether Poplar-leaves can affect Fish Ponds injuriously. His keeper complains of the loss he sustains in the stews at this season, and thinks the Poplar-leaves which fall in must be the cause of the mischief. Will any learned Ichthyophilus enlighten him?

Fruit-trees.—*Dodman.*—Your trees will not produce well-flavoured fruit on cold, wet, clayey soil, whilst they remain planted in the usual way on the natural level. In a similar case, however, great improvement has resulted from the ground being formed into beds raised considerably by soil from large intermediate trenches. The beds may be about 15 feet in breadth, and the width of the trenches 5 feet.

Fruits.—*Lancastriensis.*—"J. D." was an anonymous correspondent, and we have no means of communicating with him.

Gardoquia Hookerii.—*K.*—The brown spots on the leaves of your plant are caused by damp. The only way to prevent this is to give your greenhouse plenty of air in sunny days, and a little fire-heat at nights, in cloudy weather.§

Gesnera zebrina.—*A Constant Reader.*—This plant sometimes drops its flowers without any apparent cause, but it would appear that yours requires more heat and more moisture to bring the flowers to perfection. The plants which you received in bloom from your friend had doubtless got a check on being removed.§

Gooseberries.—*A Young Beginner.*—The following are some of the best early and late varieties:—Red Champagne (Keen's), Seedling Warrington, Red Warrington, Leigh's Rifleman, Melling's Crown Bob, Red Turkey, Rough Red, Yellow Champagne, Early Sulphur, Rumbullion, Glenton Green, Pitmaston Green Gage, Massey's Heart of Oak, Woodward's Whitesmith, Taylor's Bright Venus, Early Green Hairy, Rob Roy; Knight's Large Red Currant, is a preferable variety.‖

Heating.—*Inquirens.*—It is not possible to make the air inside a propagating house as suitable for cuttings when they are first taken off, as the inside of a bell-glass or hand-light. The soil or sand in which cuttings are placed, will not receive as much warmth from setting the pots on an inch of sawdust, placed on slate over a tank, as they will from being plunged up to the rim in the same situation. Of all materials for this purpose, sawdust is the worst.——*A Disciple.*—Blue clay will not make water tanks tight, except in a very imperfect manner; and if you attempt to heat such tanks, you will, among other evils, find your boiler choked up presently with mud. At p. 392 of this year, you will find a receipt for a calico varnish, which it is said will not rot calico. This correspondent asks, If anybody in Ireland has adopted the tank mode of heating?

Herbaceous Plants.—*An Old Subscriber.*—The following flower in April and May, viz.—Anemone palmata, yellow, height 4 inches; Cheiranthus ochroleucus, yellow, 6 inches; Helleborus purpurascens, purple, 9 inches; Arabis grandiflora, white, 6 inches; Alyssum saxatile, yellow, 6 inches; Iberis sempervirens, white, 6 inches; Sisyrinchium grandiflorum, purple, 9 inches; Epimedium grandiflorum, light pink, 4 inches; Fumaria cava, white, 3 inches; Phlox nivalis, white, 3 inches; Phlox procumbens, blue, 4 inches; and Pulmonaria grandiflora, purple, 1 foot.¶

Hybridising.—*J. H.*—The anthers are the male part of the Fuchsia, and the stigma the female. Fuchsias are not unisexual, except in the instance of F. cylindrica.

Insects.—*T. S. K.*—You should have fastened the cork in with a wafer or sealing-wax to prevent its crushing the animal, which is a Podura, but the species we cannot name. *R.*——*A. B.*—Your Wheat is infested with the Polydesmus complanatus. We must refer you to the *Gardeners' Chronicle*, vol. i. p. 196, and the "Royal Agricultural Journal," vol. v. p. 230, where you will find all that is known concerning its economy, &c. *R.*

Lisianthus Russellianus.—*A Correspondent.*—Stopping at every joint is practised only whilst the plant is young, in order to make it bushy; and when an abundance of stems are thus produced—the flowers being terminal—stopping, of course, must be discontinued for some time previously to the period when it is desirable to have the plant in flower.§

Morphology.—*J. Ansell.*—Your flowers are very curious. They are buds trying to bloom, or if you like it better, in a state of change into flowers. In this case the whole structure of the flower is broken up, and the *external scales of the flower are changed into anthers*,—an extremely unusual occurrence.

Names of Fruits.—*Apis.*—No 5, St. Germain; 6, Chaumontel; 7, 8, Passe Colmar; 9, Bezi de la Motte.‖——*J. H. Hayeroft.*—1, Passe Colmar; 2, Glout Morceau; 3, Easter Beurré——*R. A.*—Hollandbury.——*Mary Ann.*—No. 2, Glout Morceau; 4, 7, Bequêne Musqué, a stewing Pear; 5, Beurré Rance; 9, Alfriston; the other large Apple is the Blenheim Pippin.——*J. P. E.*—0, Hollandbury; 2, Beauty of Kent; 3, White Russet; 4, Yorkshire Greening; 5, Cat's Head, Beaufin; 6, Stoup Leadington; 8, Holland Pippin; 9, Herefordshire Pearmain; 10, De Neige; 11, Dumelow's Seedling; 12, King of the Pippins; 14, Royal Russet; 15, Court Pendu Plat; 16, Syke House Russet; 18, Stone Pippin; 19, Nelson Codlin, not Kirke's Lord Nelson; 20, Northern Greening; 24, Court of Wick; 27, Marmalade; 28, Old Nonpareil; 30, Doyenné Blanc; 31, Doyenné Gris; 33, Spanish Bon Chretien; 34, Chaumontel; 35, Uvedale's St. Germain; 36, Trumpington; 21, 29, 37, are correct.‖——*R. B.*—Norfolk Paradise.‖——*J. W.*—1, Dowiton; 5, Ribston Pippin; 8, 28, Lamb Abbey Pearmain; 10, Waltham Abbey Seedling; 13, 18, Kentish Full-basket; 14, De Neige; 15, London Pippin; 16, Boston Russet; 17, Hawthornden; 19, Dumelow's Seedling; 21, Bedfordshire Foundling; 22, Newtown Pippin; 25, Scarlet Nonpareil; 27, Blenheim Pippin; 30, Alfriston; 31, Kirke's Lord Nelson; 32, Api Petit. Pears—1, Beurré de Capiaumont; 2, Beurré Bosc.‖——*R A. B.*—1, Autumn Pearmain; 2, Kentish Full basket; 4, 12, Blenheim Pippin; 5, Lamb Abbey Pearmain; 6, Norfolk Beaufin; 10, London Pippin; 13, Royal Russet; 15, Yellow Ingestrie; 17, Nonpareil; 19, Hawthornden; 21, Easter Pippin; 22, Cornish Aromatic. 1, Swan's Egg; 2, Glout Morceau; 3, Beurré de Capiaumont; 4, Messire Jean; 5, Beurré Rance, 6, Black Worcester, 7, Crassane.——*E. V.*—Your Apple is not the Old Golden Pippin; it is the Reinette Grise. The other is the Golden Noble.‖

Names of Plants.—*Stowe.*—A female Yam, and hardly different from Dioscorea sativa——*J. S.*—Some Malvaviscus allied to M. pilosus.——*Vestal and J. H. H.*—Plants out of flower cannot be named.——*Constantine.*—1, Geranium molle; 2, Veronica agrestis; 3, Juncus acutiflorus.§——*W. Hardie.*—1, Unknown to us; 2, Epidendrum odoratissimum (?); and 3, E. glumaceum (?).

Pears for walls.—*Q. Q. Q.*—For a north aspect: plant Marie Louise, Jargonelle, Bacon's Incomparable, and Bezi d'Heri, the latter for stewing. For east or west aspects: Glout Morceau, Passe Colmar, Winter Nelis, Bacon's Incomparable, Beurré Rance, Beurré Diel, and Gansel's Bergamot.‖

Pelargoniums.—*K.*—In shifting plants in spring, which are kept in small pots during winter, it is much better to shake the greater part of the soil from their roots, than to re-pot them with the old ball entire.§

Primulas.—*T. W.*—Your seedling Primula is very pretty, but it possesses no peculiar merit to make it desirable for general cultivation; it is one of those pale colours that every grower of seedlings is sure to have.*

Rhododendrons.—*W. S.*—If you place your choice Rhododendrons, which were only worked last August, on a hotbed in next March, you will be very likely to injure them, and particularly if the stocks on which you have worked them were not well established before working; you had better place them in a moderately warm greenhouse or pit, and allow them to start gently, for if you do not do this all the forced growth obtained by hard forcing will be at the expense of the after-health of the plants; by no means use cow-dung liquid manure, or excite them a second time in one season, as you propose, since you intend finally to plant them in the open air.¶

Vines.—*A Constant Reader, and A. Z.*—It is impossible to have good Grapes unless their roots have free access to warmth and air. They can have no such access when they are buried to a great depth. A man who plants Vines in dung and wet clayey loam 4 feet deep, and buries the roots beneath 2 feet of this stuff must be a madman, not a gardener. Drain your borders thoroughly, mix bones, brickbats, and lime rubbish with it, so as to loosen it thoroughly, and bring the roots to the very surface; it is useless to try any other plan.——*Aliquis.*—You cannot err in having your young Vines now cut back.‖

Vine Borders.—*A Young Beginner.*—You may safely apply 30 bushels of bone-dust to a Vine border 30 feet in length and 20 feet in breadth.‖

Vines in Pots.—*An Amateur.*—You may introduce your Vines in pots to gentle heat at first, in the end of January. Sheep's-dung is a good manure for them; or if this cannot be readily obtained, other manure should be supplied.*

Walnut.—*Dodman.*—We have no knowledge of the Walnut alluded to, except from the source to which you refer, the Catalogue of L. Van Houtte, wherein it is stated to be a variety of the common Walnut, and so early a bearer as to produce a crop at the end of the third year.‖

Waterpipes.—Nothing but iron will answer for bringing water underground from a hill to the top of a house; the pressure of the water will, we fear, burst any weaker material.

Weeds.—*A. W.*—The reason why weeds rise on the surface of the ground after being dug over, nay even trenched from a considerable depth, or from the bottom of a new ditch of three or four feet deep, is because they cannot germinate without access to air, and in such situations the contact of air is prevented.

Wistaria sinensis.—*K.*—It is probable that the flower-buds on your plant have been injured by frost. It does not flower in some parts of England unless it is protected in winter.§

Miscellaneous.—*V. B.*—You had better do nothing more to your Pelargoniums till March. Keep them as quiet as you can, and away from frost and warmth, both of which are equally their enemies. Sow your Swan River seeds in February in a hotbed. We have never seen any advantage derived from steeping seeds in muriatic acid, but it has been said to act advantageously when greatly diluted. So has newly-burnt lime, reduced to powder and mixed with the seeds. Water is, however, the best steep, and hot-water for very bony seeds, such as Acacias, and some Proteaceous plants.——*A Traveller.*—Aloes and Agaves are very different plants; but what is commonly called the American Aloe, of which hedges are made in the South of Europe, is Agave Americana.——*A. Gall.*—Winter is the most convenient season for relieving forest trees of their dead wood.——*Northwood.*—There is no accounting for taste. We think the cottages at Edensor the most beautiful things of the kind we have seen; others may be of a different opinion. There are those who think the National Gallery, or the Senior United Service Club, or the thing at Derby called a chapel, objects of beauty—or even, perhaps, the squirting candlestick, misnamed a fountain, in St. James's Park. Such tastes would probably be offended by the architecture of Edensor.——*A Limerick Subscriber*—Will find the treatment of Lilium lancifolium, &c. given at p. 590 of the present year.‡——*J. Bruce.*—Apply to Mr. Cutler, No. 97, Farringdon-st.‡——*R. W. B.*—We can only repeat that the only way by which you can clear your lawn from Sorrel at less expense than relaying it is to persevere in destroying the foliage as soon as it makes its appearance. This will ultimately have the effect of killing the roots.‡——*Amygdalus.*—You can only obtain Peach and Nectarine-trees worked on the Almond stock from the Paris Nurserymen.‖——*K. K. K.*—The best way of layering Roses is to cut and peg them down; but much depends on the manner in which this is done. First, the bottom of the layer should be at least three inches below the surface of the ground; and second, the point of the shoot should afterwards be brought as nearly upright as possible. The operation may be performed as soon as the young wood is tough enough in autumn. The *New Mountain Hybrid Pink* is unknown to us; but, like all hybrids, no doubt it should be perpetuated by pipings, and not by seeds, otherwise it is likely to return to the original form. It is of little importance whether you encourage your *Adiantum* now or in the spring, as Ferns are not injured by want of light in winter. You must not put it into a high temperature at first, but keep the atmosphere moist by placing a bell-glass over your plant. A little super-phosphate of lime will very much benefit your Ferns, and particularly if it is mixed with the soil.¶——*Alpha* will find the "Vitreous Cloth," advertised at page 75 of the present year.‡——*H. W.*—A method of preserving Walnuts is given at p. 688, 1844.‡——*A Constant Reader.*—It is best to graft Camellias in spring. The scions best adapted for the purpose are shoots that were produced in the previous year.§——*Chemical Jack.*—See "Calendar of Operations" in to-day's Paper.‡——*C. J. P.*—India-rubber will dissolve in naptha; but you had better find out some manufacturer, and get it from him.——*S. W.*—We are not aware that the wood of the Common Maple is warmer than that of other soft-wooded trees. Anagallis tenella is by some botanists regarded as a peculiar genus, and called Jurasekia.——*J. G. R.*—You may enliven the appearance of your Greenhouse a little at this season by introducing such plants as Chrysanthemums, Tea-scented Roses, Chorozemas, Epacrises, and the autumn-flowering kinds of Cape-heaths, such as Banksii, cruenta, and mammosa, &c.‡——*J. Sharpe.*—It is impossible to answer your question. The names of fruit cannot be determined from such materials. You will find a list of Pansies given at p. 736 of this year.‡——*A Subscriber* will be obliged if *J. G.* will give the publisher's name and date of publication of "Thompson's Alcedo."

*** As usual many communications have been received too late, and others are unavoidably detained till the requisite inquiries can be made.

Errata, p. 764, *c*, line 70, *for* "maxilla" *read* "maxillæ;" p. 765, *a*, line 1, *for* "halters" *read* "halteres."—In the article, Grey Wagtail, in last week's Paper, p. 767, col. *a*, in stead of "the 9th of this month," *read* "the 9th of October."

GUANO (GENUINE PERUVIAN & BOLIVIAN)
ON SALE, BY THE ONLY LEGAL IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, Nov. 23, 1844.

DR. HALLETT'S DRY SOLUBLE FERTILIZER'S are, considering their power, the cheapest Manures in use, for they are entirely composed of the Phosphates and other Salts of Ammonia, and other acknowledged powerful fertilizers. They are fairly before the Public as tried things (see No. 33 of the *Gardeners' Chronicle*, &c.). 5 cwt. of either has been found equal to nearly 30 tons of ordinary horse-manure. They are applicable to all sorts of field and garden crops. No. 1 for heavy top growth, as Corn, Hops, &c. No. 2 is for all roots, and a sure preventive of the Fly in Turnips. Price of each, 10*l.* per ton, or 12*s.* per cwt.

DR. HALLETT'S CONCENTRATED LIQUID FERTILIZER is extensively used by Gardeners for improving the size and flavour of fruits and vegetables, and the colours, and perfecting the seed of flowers. Sold in quarts at 1*s.* 6*d.*, and in bottles, six times the size, at 7*s.* 6*d.* Each quart requires 32 gallons of water, to reduce it for use.

Agents for the above. London—Mr. Fothergill, Thames-street; Mr. G. Hallett, the Factory, Broadwall, Blackfriars; Messrs. Warner & Warner, 28, Cornhill; Hurst & M'Mullen, 6, Leadenhall-street; Winstanly, Poultry; Pace & Co., St. Peter's Alley. Norfolk—Bullard and Watts, Norwich. Suffolk—Mr. W. Revans, Yoxford. Leicester—Mott and Co. Gloucestershire—Mr. Betterton, Fairford. Devonshire—Mr. Seward, Plymouth. Wilts—Mr. G. King, Devizes. Glasgow—Mr. D. T. Jackson, Hartlepool. Sunderland, Stockton, and Newcastle—Pace & Co. Dundee—Green and Co. Further respectable Agents wanted.

The Agricultural Gazette.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Nov. 27—Agricultural Society of England.
THURSDAY, Nov. 28—Agricultural Imp Soc. of Ireland.
WEDNESDAY, Dec. 4—Agricultural Society of England.
THURSDAY, Dec. 5—Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.
Nov. 25—Chepstow.
Nov. 26—Framlingham.
Nov. 26—Rayleigh.
Isle of Thanet.

OUR readers are doubtless well acquainted with the theory propounded of late years by Professor LIEBIG, to account for THE PHENOMENA OF ANIMAL NUTRITION. A number of facts occurring, not only in the natural history of our own species, but also in the every-day experience of the stock farmer, which till then had been very imperfectly understood, have been satisfactorily explained by it. The process of fattening, as dependent on the circumstances in which the animal is placed, and on the sort of food given to it, has thus been illustrated by a consideration of the absolute composition of that food—for a knowledge of which we are indebted to the processes of chemical analysis—and by a consideration of the influence of warmth and comfort on the sources of waste within the animal frame.

Setting aside their mineral ingredients, Professor Liebig arranges the proximate elements of all sorts of food in two classes—the one containing gluten, albumen, casein, legumen, which are in fact different names for the same substances, according to the source whence it is derived, and which are, moreover, all identical with animal fibrine, the basis of muscle or flesh—and the other consisting of sugar, starch, &c., substances containing much carbon but no nitrogen, the element which is characteristic of the first mentioned series. After digestion, it is believed that all gluten, albumen, &c., in the food simply pass from the vegetable structure, where they existed, into that of the animal, without any chemical change taking place on them—that, in fact, so far as this class of substances is concerned, nutrition is not a *chemical* process at all. With reference to the second class of substances, again, it is believed that they are simply fuel for the preservation of animal heat, to be burnt in the lungs; and the circumstances artificial warmth, &c.—which render but a small quantity of fuel *necessary* for this purpose, being precisely those which render the combustion in the lungs of only a small quantity of fuel *possible*, that any surplus material of this class, which under such circumstances may occasionally occur, undergoes in the body a chemical change and combination with certain elements always to be found there, and assumes the form of fat. Excepting the results of some lately published experiments in France, the hitherto recorded facts bearing on this subject, which have been examined, receive in this manner a very satisfactory explanation; as, indeed, Dr. Playfair showed in his able lectures before the English Agricultural Society.

The second part of Liebig's theory—that which relates to the formation of fat—has been objected to, we believe, from the first, by M. Dumas, and other French chemists; and the results of the experiments we have just alluded to, which are published in the last Number of the *Annales de Chimie et de Physique*, are also so much opposed to it, and so important in many respects, that we hasten to place them before our readers.

It is asserted by the French chemists that nutrition not only with reference to the formation of flesh, but in respect to the fat also, consists simply in the shifting to their positions in the animal frame of elements already perfectly formed in the vegetable—that as the fibrine of the animal exists as gluten or legumen, &c. in the vegetable, so animal fat is obtained from the fatty matter occurring in most vegetable substances. They altogether deny the formation of fat out of the surplus sugar, starch, &c., which we have already referred to as fuel for the lungs; and their denial is founded on facts similar to the following:—

With the view of determining between the rival theories, M. Boussingault subjected two milch cows to three different descriptions of diet in as many successive fortnights, or in periods of about that duration. They weighed at the commencement of the first experiment, 1262 lbs. and 1280 lbs. respectively. They were then put on a diet of Mangold Wurzel alone for 17 days, during which they ate 2321 lbs. and 2477 lbs. of this root, and yielded 26 and 27 gallons of milk respectively. The following is the composition of the milk:—

	1st Cow	2d Cow
Cheese	3.67	3.81
Sugar of milk	3.39	3.74
Butter	4.56	3.42
Alkaline chlorides	0.43	0.54
Phosphates	0.22	0.26
Water	87.73	88.23
	100.	100.

The excrements of these cows during this period weighed 574 lbs., containing 91 lbs. of dry matter, and 3.3 lbs. of fatty matter. The cows, towards the end of the experiment, daily lost weight, and became much emaciated; they weighed at the end of 17 days 1175 lbs. and 1188 lbs. respectively. Mangold Wurzel, M. Boussingault had by previous analysis found to contain $\frac{1}{1000}$ part of fat, and .0021 of nitrogen, .00046 of phosphoric acid. The following, then is a tabulated statement of this experiment:—

	lbs.	Fatty matter. lbs.	Cheese, albumen, &c. lbs.
Two cows have given—milk	460	17.26	17.2
" " dry excrement	91	3.3	undetermined.
Fat matter in the products		20.56	
Mangold Wurzel consumed.	4798	4.8	
Fat unaccounted for		15.76	

Weight of cows at commencement . . 2542 lbs.
" " termination . . . 2363 "
Loss of weight during the period . . . 179 lbs.

Supposing, as we are bound to believe, that the quantity of the starch, sugar, and other carbonaceous elements in the roots, were present in quantity abundantly sufficient to supply the respiratory organs with fuel, then the fair inference from this experiment is that the cows, not finding in their food a sufficiency of fat to supply the butter of their milk, &c., and being *possessed of no power to convert starch, sugar, &c., into fat*, were forced to draw upon that already deposited in their own tissues—hence their loss of weight. The animals, M. Boussingault informs us, were so emaciated that he was forced to put them for three or four days on their original food, hay, before he could venture to proceed further with the experiment.

At length he placed them and kept them for fourteen days upon a diet of aftermath hay; and of this experiment we shall at once tabulate the results, without making any preliminary statement. The aftermath was found, by analysis, to contain 3.5 per cent. of fatty matter, .0012 of nitrogen, and .0034 of phosphoric acid. The quality of the milk from the two cows during this experiment was as follows:—

	1st Cow.	2d Cow.
Cheese	3.63	3.56
Sugar of milk	3.46	3.94
Butter	5.92	4.39
Alkaline chlorides.	0.45	0.52
Phosphates	0.27	0.20
Water	86.27	87.39
	100.	100.

The following are the results of the fortnight's experiment on the hay diet:—

	lbs.	Fatty matter. lbs.	Cheese, &c. lbs.
Two cows have given—milk	350	17.6	12.5
" " dry excrements	339	11	
Fat matter in the products		28.6	
Hay consumed	1038	36.3	
Fat in excess		7.7	

Weight of cows at commencement . . 2430 lbs.
" " termination . . . 2541 "
Gain of weight during the period . . . 111 lbs.

Here, again, where the fatty matter supplied in the food exceeds that required for the milk, &c., it is deposited in the tissues of the animal, and we accordingly find that the cows have almost regained their original weight.

The following is a tabulated account of the third experiment, which lasted 14 days, during which the cows were fed only on Potatoes.

From three analyses of the Potato, M. Boussingault concluded that it contained ·002 of fatty matter, ·0037 of nitrogen, and ·00109 of phosphoric acid.

The quality of the milk during this period was as follows:—

	1st Cow.	2d Cow.
Cheese	4.87	3.99
Sugar of milk	3.09	3.99
Butter	3.97	4.63
Alkaline chlorides	0.55	0.55
Phosphates	0.27	0.27
Water	87.75	86.57
	100.	100.

	lbs.	Fatty Matter, lbs.	Cheese, &c., lbs.
The two Cows gave—milk	281.	12.34	11.66
" " dry excrements	187.	1.12	
Fat matter in the products		13.46	
Potatoes consumed	2269	4.73	
Fat matter unaccounted for		8.73	

Weight of Cows at commencement . . 2360 lbs.
" " " termination . . . 2288 "
Loss of weight during the period . . . 72 lbs.

Here, as in the first experiment, we have a loss of weight, which can only be accounted for on the principle there stated, that the cows were forced by lack of fat in the food, to draw upon the stores in their own tissues, at the expense of their weight. These results are apparently opposed to that part of Professor Liebig's theory, which endows animals with the ability to form their fat out of any excess of the carbonaceous elements of their food.

As M. Boussingault says:—"These experiments evidently show that Mangold Wurzel or Potatoes given alone are insufficient for the proper nourishment of milch cows—even though they be given abundantly, one might almost say *ad libitum*, since very often the cows left portions in their mangers.

"A diet may be insufficient for several reasons:—1, If the food does not contain such a quantity of nitrogenised matter as may serve to replace the matters equally nitrogenised, which are constantly wasting from the body; 2, if it does not contain the carbon necessary to replace that which is burnt in the act of respiration, or carried off in the secretions; 3, if it be not sufficiently charged with the salts, particularly the phosphates, necessary to restore to the economy those saline matters which are continually expelled; and 4, it appears from our experiments that food will be insufficient, if it be not rich enough in fatty matters, to supply those which are carried off in the milk and other secretions."

Referring to his experiments, he adds, "The facts I have collated will doubtless receive many explanations; but that which appears to be the most natural, consists in admitting that the food of herbivorous animals ought always to contain a certain quantity of substances analogous to fat, destined to assist in the production of the fatty tissues, and bile which contains fat in considerable quantities. If, notwithstanding the insufficiency of their diet in this respect, cows should continue to give the same milk, &c., as they yielded under a complete alimentary *régime*, it is because they elaborate these secretions at the expense of their own fat. Possibly, for a limited time, cows may continue, under such circumstances, to give the same number of gallons of milk; the quantity will not diminish suddenly, but each day also, as I have proved, they will lose 4 or 5 lbs. of their own weight; and if we persist in administering an *incomplete* diet, then, however *abundantly* it may be supplied, they will ultimately become so emaciated as to endanger life."

ON THE FARMER'S DUNGHILL.

I AM not about to offer a solution of the most difficult problem in agriculture, but only to state a fact in proof of the great importance of having a practical answer to the practical question—How must I make a dunghill? I have attempted to estimate the quantity of carbonate of ammonia which escapes into the air during the fermentative process of converting farm-yard manure into a suitable compost for land. The value of the manure lies chiefly in the nitrogenous substances which are retained in it, and it is deteriorated in proportion to their escape. The quantity lost may be estimated by the following experiment:—If a slip of glass, about 3 inches by 1, be moistened with 2 or 3 drops of hydrochloric acid (spirits of salt or muriatic acid) spread uniformly over 2 inches of its surface, and then be held in the vapour arising out of a dunghill, its acid surface being downward, it will be found that in one minute a portion of carbonate of ammonia, amounting to $\frac{1}{10000}$ of a grain, has been fixed by the acid, and converted into a hydrochlorate of ammonia. Upon evaporation over the flame of a candle, the feathery crystals of the salt will be immediately recognised under the microscope.

Now, every 2 inches of the surface of the dunghill offering an escape to an equal quantity of ammonia, it follows that every square yard of surface loses every minute at least 3-5ths of a grain of this carbonate, and every day about 2 ounces. If the hot fermentative process be continued for a month, each square yard will, at

the same rate of loss, give off nearly 4 lbs. of this volatile alkali; and as the estimate will not be taken too highly if we consider every solid yard in the dunghill, during the whole period of its active decomposition, to evolve at least as much gas as escapes from one square yard of surface in a month, it will follow, that upon the moderate dressing of 10 solid yards per acre, there will be a loss of 10 lbs. of ammonia, and consequently, as Liebig has shown, a loss of what would suffice for nearly 10 bushels of Wheat. "With every pound of ammonia which evaporates, a loss of 60 lbs. of Corn is sustained."—(*Agricultural Chemistry*, page 193.) Now, grant me the accuracy of the Professor's debtor and creditor account between Corn and ammonia, and I will give any one all the Wheat I grow who will teach me to grow all that I lose. At all events, the necessity of getting our volatile friend into "a fix" is most evident, and for this purpose we may use with advantage both gypsum and sulphuric acid. On making the dunghill in the first instance, and when subsequently turning it over to accelerate fermentation and decomposition, it will be advisable to strew a thin layer of gypsum after every rise of 2 feet of manure, and ultimately we may pour on the top as many pounds of sulphuric acid, diluting each with a bucket of water, as there are single horse-loads in the dunghill. I can state, as the result of experiment, that this application of dilute acid immediately checks the evolution of vapour and the escape of ammonia, and consequently, at a very small cost, it improves the agricultural value of the manure, and therefore tends to secure what Liebig holds out as the reward of good farming—"the best possible crop every year."—*—J. B. Reade, Stone, Aylesbury.*

THE RELATIVE POSITION OF AGRICULTURE.

Everything connected with Agriculture seems anomalous. Agriculture and Manufactures, Trade and Commerce, are really bosom friends. Still they appear to be sworn enemies—a gulf of non-communication yawns between them; they are like a chain in two parts, wanting a connecting link to render it available. The connecting link in the disunited chain must be "Capitalised Companies for the Improvement of Agriculture."

Agriculture and manufactures are not antagonistic interests; but the reverse. They are as essential to each other as the limbs to the body—injury to the one must be suffering to the other. Agricultural production is the life-blood of the nation. That increase in food which the Almighty so incomprehensibly vouchsafes to us, and with which we cannot dispense for a day, is the artery of circulation; the veins of exchange bringing in return manufactures and luxuries. The precious metals or credit represent the balance between them. It is a well-established fact, that there is in trade, manufactures, and commerce, a superabundance of capital, whilst in agriculture it is as sadly deficient. Ask an improving landlord or tenant, why their various improvements are so scantily and temporarily effected—they will say, not that it is unprofitable to make them permanent, but because there is not sufficient command of money to do so. It is painful to see talented and spirited agriculturists crippled and restrained by the want of that capital which in towns and cities so abounds as scarcely to command 3 per cent., and is in consequence forced into rash speculations, or invested in loans to foreign nations, with whom we may be to-morrow at war, and who now injure us in trade, &c.

In agriculture there are few or no bills of exchange, or other means by which an honest and industrious man may trade on the capital of his wealthier neighbour. In trade, commerce, or manufactures, the abundance of capital permits all the advantages of an extended credit. In agriculture but few such facilities exist. It is the want of capital that causes so small an employment of agricultural labour. A good farmer will readily admit, that every man's labour pays a profit, and that the more labour he employs the greater is his advantage. But then, Saturday night comes! Where is the money to come from to pay them? 'Tis twelve long months, at least, before that money is returned to him.

Labour itself is the very best of capital when employed, but we neither employ it with money payments, nor allow it to employ itself without money payments, by means of allotments. We grasp and grudge the industrious labourer's patch of ground, but, inconsistently enough, pay cheerfully heavy gaol, police, or pauper rates, to restrain or punish the crimes consequent on his non-employment, poverty, and demoralisation. I mention these matters as strong evidence of the necessity of applying the surplus capital of towns to the improvement of agriculture. A man with his cow, pig, and an acre of ground, has a stake in the soil. If non-employment and poverty fill your gaols, it is a logical deduction, that employment and comfort can alone empty them.

Self-interest should alone induce us to take up the question, but the higher moral sense of justice to the general welfare commands us so to do. Honour is due to those counties—Lincolnshire for one—where cottagers can keep a pig or a cow, without being suspected of robbing their masters. Those masters will be found to be, as a natural consequence, men of talent, capital, and education; and their workmen many degrees in advance of those without either cow, pig, or land; ragged, and half-starving on seven or eight shillings per week. The comparative criminal records of these districts would be instructive. The condition of the cottager is too frequently a true index to the character and position of his employer. Want of employment, under any circumstances, is injurious to the community at large. Too much thinking, and too little muscular action, is prejudicial to the working classes, and politically dangerous. Non-employed individuals must not starve: but, as they produce no food, they must be sharing the bread of the industrious—this is an injustice, an indirect one, felt but not seen.

Let us inquire why capital finds its way readily to every foreign loan or hazardous scheme*, that tends to give strength to foreign countries and to weaken our own. Why have we companies, British and foreign, for every object except agricultural improvement? Is it because the 3 per cents. pay only 3 per cent.? Certainly not! Is it because we do not feel confidence in our landed tenures? Is it that there is no disposition to improve the soil? I answer—decidedly none of these causes. It is because we have no authorised and competent channel for the profitable investment of surplus capital in agricultural improvement.

Ignorance and want of combination are at the root of the evil. Everything in this way is left to individual enterprise. As well might a single shareholder attempt constructing his portion of a railway, with all its complicated accompaniments! Imagine him attempting such an object, himself without experience, and unaided by all the various aggregation of talent necessary for the details of such an operation. The idea is absurd; and yet the scarcely less complicated operation of landed improvement is, up to this hour, left in the position I have described.

Ask a capitalist, why he does not invest his money in land or agriculture? He will look sternly grave, and quote a hundred instances where individuals have ruined themselves by such a course. So now he rushes into some foreign loan or project, to the great injury of his own countrymen, fearful of the "law's delay" in conveyance with all its multifarious objections, *pro* and *con*, most likely alarmed by the rumoured fate of some friend who, having at last got his estate, knows nothing about the management of it, and after struggling with incompetent tenants or designing ones—new leases, valuations, tormenting applications for repairs to the old dilapidated buildings, appeals for returns of rent, and a hundred other vexations, finds his rental reduced to 2½ per cent or less, sells at a loss, and retires from the contest in despair. His example is quoted, and his mishap magnified to a hundred other capitalists, who ever after, from father to son, shun the dangers of meddling with so disastrous an affair as landed investment.

As to agricultural improvements, why if a man has the courage to attempt it, he will at the outset encounter a host of doubts, prejudices, and obstructions—a hundred conflicting opinions as to the width, depth, distance, and materials of his drains will present themselves. Should he by good fortune settle this matter rightly, he is astounded with multifarious suggestions on subsoiling and courses of cropping, quantities and distances of seed, and state of crops for harvesting. As to artificial manures, a very host of nitrates and sulphates beset him in front and rear, with soot, salt, and guanos on every side. He turns pale at the perspective of lime and chalk. Undecided and bewildered by their contending claims, he is coolly told that a perfect knowledge of agricultural chemistry, geology, entomology, and botany, can alone enable him to decide correctly. Having pondered upon the respective merits of short horns, long horns, and no horns; Downs, Leicesters, Cheviots, Kents, and Cotswolders; and whether corn, cake, Carrots, or Coleworts, are most fattening — he hurries away to inspect a thousand complicated implements of agriculture, which it would require a life of mechanical education and skill effectually to appreciate and discriminate. In despair he gives up the contest, loses his money or dies, leaving no authorised version of the knowledge he has acquired, but bequeathing to the venturous few the same course of toil, trouble, doubt, and disappointment; but had he succeeded, his motives would be misrepresented, his facts disbelieved, and his character blackened by those who consider that agricultural ignorance is bliss, and that improvement opens the eyes of the landlord, to the injury of the tenant. Now all this might be easily obviated and prevented by a well conducted company, having practical directors, with proper engineers and officers. Do away with the law of mortmain as regards such companies. Let them purchase waste or poor lands—drain, char, trench, crop, and let them. Let there be rival companies, and their shares quoted at the stock exchange, the same as railway companies. Their success would depend upon their abilities and results; and a man disposed to invest his money in agricultural improvement could, without any personal trouble, buy or sell his shares, or bequeath them, without more anxiety or care than attends any other investment.

The importance of such companies is too obvious to need comment; all other undertakings, however useful or great, I consider secondary and subservient to the production of our daily bread, and the provision for our daily labour. Let our city capitalists and our great practical agriculturists combine — let one find money and the other judgment: let them consider their interests inseparable (as they really are). How delightful will it be to see in our daily papers lists of Land Improvement Companies for every county in England, Ireland, Scotland, and Wales, quoted on the Stock Exchange! How pleasant to watch and compare the management and success of a hundred such companies, to read of their meetings of shareholders, and of their prospects; to see those, whose Directors possess most talent, energy, and discretion, publishing their Annual Reports, and stimulating or shaming the sluggard agriculturist! How much more grateful to see Mr. Cobden and Mr. Baker on the same committee, exercising their great abilities to stimulate the productive powers of our grateful, but neglected soil—throwing to the winds the question of foreign importation or protection. How pleasant to see in our shipping lists, that having abundance of Corn, we are exporters of Flax, oils, and other matters, which we are now obliged to purchase! Could we but produce food with as much speed as we do manufactures, we should, indeed, be a great nation—we have the means to do so had we but the method. Had such companies existed years ago, millions of our money, lent or wasted to strengthen other nations, would have been employed at home in adding to our happiness and welfare. My earnest wish is, that I may be spared to see my suggestions in practical operation—it will be amongst the happiest moments of my life! Our duty to our country and to ourselves claims our attention to this matter.—*I. J. Mechi*, 4, *Leadenhall-street.*

P.S.—There are already some Agricultural Colleges, Agricultural Drainage Companies, and no doubt there will be Loan Companies, Improvement Companies, and Companies for the cultivation of Flax, Oils, &c., which are now purchased of foreigners.

* October 11th, 1851. The Lisbon-Oporto Railway is thus noticed in this day's *Spectator*, page 1060:—"A Railway is projected from Lisbon to Oporto, through Santarem and Coimbra, half the necessary capital to be raised in England, and half in Portugal." "One hundred Thames Tunnel shares, on which 500*l.* have been paid, were sold the other day for 30*l.*" Can Agricultural Improvement Companies turn out worse than this?—I.J.M.

THE PLOUGH.

(*Continued from page 739.*)

In considering what mode of ploughing will insure the attainment of our object in the process, it is evident that we cannot reason from the operation as performed on land already in a loose state; there, indeed, no difference would be perceptible between the work of two very different implements. If we are to compare the work of two ploughs, it must be when on land, such that the form and position of the sods, as each is cut and turned over, will be preserved. Instead, however, of comparing the work of two ploughs, and ascertaining which is superior, let us consider the work of only one, and inquire under what circumstances it will be perfect.

It is believed that the value of the operation of ploughing lies in the exposure of a fresh surface, and in the raising of earth in the form of ribs, which, when pulled down by the harrows, forms a seed-bed. That land is thus best ploughed which has the greatest surface exposed, and which has the greatest quantity of earth raised in the form of these ribs. In other words, supposing, in the annexed figure, the crooked line, A B, to

represent the surface of the field (and the dotted lines which represent sections of the sod will show how such a surface is produced by ploughing), then where this line is a maximum, and where the earth raised in the form of ribs, which are represented by the sections *a*, *b*, &c., is a maximum, then the land is perfectly ploughed. It is demonstrable that, with any given depth of furrow, if one of these conditions exist, the other exists also. That is—wherever the surface exposed is a maximum, then with the existing depth of furrow, the quantity of earth raised as ribs above the general level is a maximum. We do not now take into consideration any question regarding the proper depth of ploughing, and it is very possible, in fact it is the case, that two specimens of ploughing may be of equal merit in respect of the two points just alluded to, while the one may be superior to the other in respect of the third point, the depth of the operation. The subject, however, of the proper depth of ploughing does not properly fall within the scope of these remarks, any more than does the subject of the propriety of a straight furrow, or that of any other circumstance dependent on the will or the skill of the ploughman: it is only with those parts of the operation which, being dependent on the make of the plough, are beyond the control of the ploughman, that we have to do.

Let us now confine our attention to a single sod. In the above figure the dotted lines represent a section of a sod before being cut. On being cut and raised, it turns about the point or edge A, till its position is perpendicular; and then it turns about E, till it falls on the corner of the sod that has just before been turned, and thus it assumes its final position—that of the figure in the black lines, A, E, D, C. It then forms a support for the next sod which is cut; this acts in the same manner for the one which follows it, and so forth. Now, it is evident that the sum of the lines C D and D F represents the amount of surface exposed, and the contents of the triangle *a* represent the amount of earth raised in the form of ribs over the surface of the land. A little consideration will also show that both of these points depend entirely on the form and on the position of the sod.

In ascertaining what is the proper form of the sod—what form will insure the exposure of the greatest surface—it is evident that we have only two forms to choose from; that in which the angle *b c d* (see the following figures), is a right angle, and that in which it is obtuse. This angle cannot be acute, for if the turf were cut so, it could not be turned. This is evident if we consider its position while being cut, before being moved. The figure *a b c d*, which as before represents its section, turns about the point *d*; and if the angle at *c* be acute, it will not be able to turn at all, for it will be held by the overhanging fast land *e b c* (fig. 2); it must therefore be

either obtuse or a right angle. On looking at figs. 1 and 3, representing sections of ploughed land, it will at once appear that the greatest surface will be exposed when the sods are most angular. The smallest possible angle at which a sod can be cut and turned is a right angle; the sod should therefore be cut of a rectangular form. In order to insure this, the plane in which the coulter of the plough moves must, of course, be at right angles to that in which the edge of the sock moves.

I may at once state, without quoting the mathematical proof of it, that the greatest surface will be exposed when the turf lies at an angle of 45°, as in fig. 1 above, and that the turf will lie in this position only when its depth is to its breadth as about 7 to 10.—*M. S.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Culture of Potatoes.—The quantity of this valuable esculent grown in East Lothian is not very considerable, their culture being chiefly confined to the vicinity of the towns and villages, where they are planted by a few farmers for sale, and by tradesmen and labourers. Potatoes are not cultivated to any extent as food for cattle; in the majority of instances they are planted merely to supply the farmer's own house; each hind also receives as part of his annual wages Potato-land equal to from 1200 to 1500 yards, along a drill, or 5 bolls (2½ qrs.) of Potatoes in lieu of the ground.

Potatoes are generally taken after a crop of Oats, but they are also occasionally planted upon land newly broken up from Grass, although this is an obvious violation of the principles of alternate cropping. The preparation of the land for Potatoes being, in most respects, similar to that requisite for Turnips, detailed in my last Paper, it is unnecessary to occupy much space in noticing the preparatory culture of this crop. The East Lothian farmers do not pretend to extraordinary skill in growing Potatoes, but they are all perfectly aware that the more effectually the soil is reduced and deprived of root-weeds, and the nearer it is brought to a state deemed sufficiently pulverised for Turnips, so much the more certain will be the prospect of an abundant crop. As in the case of preparing the land for Turnips, repeated ploughings, harrowings, rolling, and grubbings, are given to that intended for Potatoes: but the nature of the soil, and its condition in respect of weeds, form the only guide for determining how frequently these operations are to be performed. It is of great importance, and particularly so in droughty seasons, to get the soil as finely pulverised before planting the sets as possible, as it is well known that cloddy drills, however well rolled after being formed, considerably aggravate the evil effects of drought, besides diminishing the beneficial influence of moisture.

The usual period of planting is from the middle of April to the middle of May. When the ground is sufficiently prepared, and the proper time arrived, the drills are formed, precisely in the same manner as in the case of Beans and Turnips; but with this difference, that for Potatoes the drills are made about 3 inches farther asunder than for either of those crops. The manure chiefly employed is farm-yard dung; it is invariably carted out to the field during the previous winter, or early in the spring, and is turned over to accelerate its fermentation, a week or so before being applied to the land. While the drills are being formed by the plough, the manure is carted from the heap and equally distributed along the hollows of the drills. The sets are then placed at the proper distance—from 8 to 10 inches—apart, upon the manure; both are immediately covered, and the drills rolled with a light roller.

Some farmers plant the Potatoes entire, with a view of diminishing the risk of failure, and this practice is gaining ground; when divided into two or more sets, which is the most general practice, the cutting is performed on the day in which they are planted, and the sets, in many instances, are dusted over with gypsum. Besides farm-yard dung, guano is also extensively employed as a manure for Potatoes, and with the best effects. The first culture given to Potatoes after being planted, is harrowing the drills with a pair of Grass-seed harrows, just as the young stems are beginning to appear above the ground, the objects of this operation being partially to level the drills, to pulverise the soil above the young plants, and to destroy any weeds which may have commenced to vegetate; but this process, though manifestly advantageous, is frequently omitted altogether. The subsequent tillage consists in horse-hoeing, hand-hoeing, and weeding, repeated at intervals until the complete destruction of weeds, and the pulverisation of the soil between the rows, are effected. The last operation connected with the after-culture of Potatoes, is raising the earth up to the stems of the plants, which is done by passing a plough with two mould-boards along the intervals between the rows, the earth being loosened immediately before by the drill-grubber. This earthing-up is performed at two stages—once very lightly, while the stems are but short; and finally, at a greater depth, about the period when the plants are assuming their flowers or blossoms. The Potato crop is generally taken up in the following manner:—The plough is passed with a deep furrow along the side of each drill, which it reverses at a single line, and the tubers thus exposed are immediately collected into baskets, and emptied into carts, in which they are conveyed from the field. Persons provided with three-pronged forks or Potato-graips, as they are usually termed, then follow, to shake up the earth and turn out the remainder of the Potatoes. Each man is attended by a gatherer, and there are always some carts at hand into which the contents of the baskets are emptied. After the drills have been all reversed by the plough, the earth well shaken with the graips, and the tubers exposed by these means all gathered up, the land is several times harrowed for the double purpose of collecting the stems or tops into heaps, and of bringing to the surface any Potatoes which may have previously escaped observation. As this crop is seldom cultivated on a large scale here, the tubers, on being taken up, are generally stored in a house appropriated for the purpose; but when house accommodation cannot be afforded, they are formed into an oblong heap, in some convenient situation, first covered with a layer of straw, and this again with a coating of earth from 10 to 12 inches in thickness. The stems being carted to the yards, or to a heap for manure, the land is ploughed for Wheat, by which the Potato crop is always succeeded where the soil is suitable, and a small boy or girl follows each plough to collect any Potatoes which may be turned up.—*T. Sullivan.*

Home Correspondence.

Farm Book-keeping.—Below is a supposed statement of Debtor and Creditor account in the form I make up mine. Perhaps you will have the goodness to tell me how I am to dispose of the *stock* portion of it:—

Debtor.		*Creditor.*	
Wages	£600	Wheat sold	£360
Tradesmen	100	Barley sold	150
Miscellaneous articles bought	100	Oats and Hay sold to self	250
Live stock bought	250	Dairy produce and poultry	200
Losses of live stock	30	Live stock sold	800
Rent, taxes, &c.	800	Stock taken in to feed	100
		In granary end of year	60
		Hay in stack do.	100
	£1880		£1960

Value of stock beginning of the year £1100
Do. end of the year 1000

—*E.*

[The value of stock at the commencement of the year should obviously go to the debtor side, and that of stock at the end of the year to the creditor side of your account. The stock at commencement, + expenses and purchases, will then be on one side, and that at the end + amount of sales will be on the other; the balance ought not to satisfy you unless it amount, besides a salary to yourself a practical farmer or bailiff, at least to 10 per cent. on your invested capital.]

Formation of Hop-Grounds.—So much depends upon the soil and situation that no just opinion can be given by a stranger, the ultimate success depending upon the choice of situation as well as of soil. I think "Humulus" would be decidedly wrong in removing the male (or barren) plants under the idea of their being useless, as experience teaches me that the Hops grown in the vicinity of male plants are certainly far superior to the rest of the garden, both as regards quantity and weight; and indeed this assumption is partly borne out by the fact that one of the largest growers in the Farnham district, (who has nearly 200 acres) is decidedly in their favour. I am aware that in many gardens the growers will not allow a hill of male plants to remain; but this I am convinced is in opposition to all rules of Nature, with respect to impregnation or the fructifying properties of plants. The choice of plants should depend upon the nature of the soil to be planted. I should recommend Williams's Grape, the Golding, or the improved Green Bine, for rich deep loamy soil, producing greater weight and a clearer sample than the old Green Bine, which will flourish on a thin gravelly soil, producing a tolerably good sample with respect to colour, but apt to be coarse and tally. Cuttings or plants can be obtained from many growers at Farnham.—*Quercus II., late a Farnham Planter.*

Dr. Velloly's Forks.—This implement I consider so important, both for horticultural and agricultural purposes, that you will confer a great benefit upon the community by giving it every publicity in your pages. I introduced it into this neighbourhood five years ago, through the kindness of a gentleman at Wymondham, Norfolk, whose name I forget, and who cultivates a farm of 200 or 300 acres principally by forking, instead of the plough—manual labour, in the place of horse labour. Our practice here, is to fork under the furrow-slice after the plough, which follows to cover over the forked work, so that the manured soil is kept uppermost. This plan may not be the best in all soils. A tenant farmer employed upwards of 40 men last winter in this parish at this work; and his luxuriant Swedes give satisfactory evidence of ample remuneration, even in his first crop. In another field here, the proprietor has upwards of 30 tons per acre of Red and White Carrots upon forked land, notwithstanding the dry summer. If it suited the convenience of your correspondent, or any other gentleman, to witness the operation, by a ride by our railroad, he or they may readily acquire a practical knowledge of the management and expense, as a party of 12 or 15 men are now forking a field adjoining the Witham station. I have also a set of labourers at the same work within two miles; the forks can also be had of Mr. Wilson, ironmonger, of this town, 5*s.* each. I wish further to state, that I am accessible to a call from any gentleman interested in this matter. No land should be forked unless it be previously drained, if the nature of the soil requires it. The practice of marling and chalking land, referred to in your Leader of last week, as performed near Ridge, in Hertfordshire, by sinking a shaft and mining, was, I think, introduced by Dr. Lindley, subsequently Bishop of Llandaff, at Tyttenhager, just below Ridge-hill. I have a brother who farms in that neighbourhood, and who adopted the plan some years since with great success. If I have an opportunity of getting from him a detailed statement of the work, I will send it to you. The profitable employment of labourers at adequate wages is an imperative duty upon landed proprietors.—*Henry Dixon, Witham.*

Turnip Fly.—Two methods of destroying the Turnip-fly, which are said to be successful, are indicated by Mons. Joly, in a very interesting Memoir on the little beetle which is so destructive to the crops of Lucerne in the South of France (Annales des Sciences, Nat. 3 série, vol. ii. p. 34). They are not given on the authority of Mons. Joly himself, but are extracted from Collar's work on the Natural History of those Insects which are injurious to Corn and Woods. The first consists in pouring boiling water on a certain quantity of common wormwood (*Artemisia Absynthium*, L.), and leaving it to infuse for ten or twelve hours, and then sprinkling the young plants with the infusion. A wisp of straw dipped in the infusion is used for this purpose. It appears that the bitterness of the wormwood is so strong and so lasting, that a single sprinkling is sufficient, except very heavy showers fall immediately after the sprinkling, in which case it may be expedient to repeat the operation. This plan is said to be completely successful. Mons. Windram asserts that he has employed it for many years with the happiest results. A second method indicated by the same author is to powder the young plants, when wet with dew, with dust from the road side. This plan, especially if the sun chances to break out immediately after in full splendour, so as to dry the dust upon the leaves, is said to be equally efficacious with the former.—*M. J. B.*

Guano.—I see it is feared that the supply of guano from Ichaboe, &c., will shortly fail. A vessel has been despatched to ascertain if a supply can be obtained from any of the islands on the eastern coast of Africa. No doubt she will be successful. I am informed by a naval friend that, some years ago, when employed in surveying the shores of Africa and Arabia, to the N. and S. of the entrance of the Red Sea, he constantly saw boat-loads of sea-fowls' dung brought by the natives from the islands, for the use of their Date-gardens on the mainland. From this, it appears that the Peruvians were not the only people acquainted with the use of guano as a manure. The same gentleman informs me that the dung from the numerous pigeon-houses on the banks of the Nile is carefully collected and sent down to Cairo, for the gardens in the neighbourhood of that city. By the way, in many of the cane temples in Western India, and in the catacombs near Thebes, Siout, &c., are considerable quantities of bats'-dung, which smells exactly like guano, and, probably, would be equally valuable as manure. The first specimen of guano I saw was in the establishment of the Messrs. Drummond, at Stirling, the smell of which instantly recalled that with which I had so frequently been annoyed in the midst of the sublime and beautiful!—*Eskdale.*

Manures.—My little field is chiefly composed of sandy soil and gravel, with here and there a little clay; it lies on the side of a steep hill. It was, when I first had it, full of bad Grass and weeds. I have had it trenched throughout and planted with Potatoes, partly by sets, and partly with whole ones. The latter alone produced plants this dry summer. I tried some rows where the Potatoes had missed, with Turnip-seed, some with Potter's guano, some with African, and some with superphosphate of lime. To my astonishment, though I know the seed to be new and excellent, scarcely a plant has appeared. [No kind of manure will compensate for want of moisture. The seed, probably, did not sprout because of the drought.] In a corner of my butcher's yard is a long hole, near the pigsties, in which is a deposit of the washings of the slaughter-house—blood, dung, entrails, and other garbage, and he also tells me, some night-soil—(plenty of the liquid, alas! as usual, runs down a drain no one knows where—the gravy of the meat). This, he tells me, I may take; is it not well worth having? But, should it not be thoroughly decomposed—if not, will it not breed vermin? But what will decompose it? Will not the stench, &c., almost breed a plague? Would earth mixed up with it be enough to fix the ammonia; and then, would the mixing be good for my field, or too strong? If so, what should be the proportions of the substances to weaken it?—*Northwood.* [When a mass of organic matter will not readily decompose by itself, the process of putrefaction may be hastened by mixing it with matter in which it is rapidly proceeding. All this valuable material should be made up into a compost with ordinary farm-manure, means being taken by covering over with vegetable mould, or by such methods as the Rev. Mr. Reade, in another column, recommends to hinder the escape of effluvia.]

Van Diemen's Land Wheat.—The accompanying box contains a few ears of Wheat, which were grown this year at Bushy Grove, near Stanmore, on a farm in the occupation of Mr. Stewart Majoribanks, M.P. The seed was imported in 1844 from Van Diemen's Land, and was sold as seed Wheat last autumn, in Mark-lane, at 68*s.* and 70*s.* per quarter. It yielded rather more than 4 quarters per acre, which is considered a very

good crop in that neighbourhood. The present sample is an average one, and was only kept by the bailiff of Mr. Majoribanks for his own guidance, and not for purposes of exhibition. There is a quantity of Wheat lately arrived from the colony, and more is expected. I will procure a sample, and you can try a small quantity at Chiswick.—*Edward Barnard.* [The ears are of average length, and exceedingly well filled; the grain—it is white Wheat—is a good sample.]

Sea Buckthorn.—An "Old Subscriber" is informed that the botanical name for Sea Buckthorn, or common Sallow Thorn, is Hippophäe Rhamnoides: he will find it mentioned in "Withering's Botany; or, Systematic Arrangement of British Plants," with some account of the plant. But as the book may not be as it ought to be, if the "Old Subscriber" takes an interest in such matters, in his possession, "M. D. P." will add that it is found on the sea-shore, in sand; at Lindley Coast, Lincolnshire; Sandwich, Deal, and Folkstone, Kent; Isle of Sheppy, Cley, and Sherringham Cliffs, Norfolk; between Whitby and Lyth, Yorkshire. It is very easily propagated by suckers or layers, or even by seeds. Rabbits do not touch it; it grows to 8 or 12 feet high, and forms a brush-wood, or even shelter to other shrubs that will grow in sandy soil by the sea-side. There have been several editions of "Withering's Botany,"—the last should be asked for.—*M. D. P.*

Guano.—I have had for many months guano and common salt in separate bags, standing a little distance from each other in my barn. The other day I had occasion to use some salt, and on breaking the lumps they smelled almost as strongly of the guano as the guano itself. How is this to be accounted for? The salt has evidently drawn to itself, and imbibed and retained the volatile matter of the guano; and this, I suppose, must render the salt more beneficial for agricultural purposes. —*Ullswater.*

A Few Notes.—1st. One of your correspondents has said that flukes in rotten sheep are only found in the liver, but I have seen them come from the uterus, with the lamb on yeaning. 2d. *Draining.*—Our country is capable of being improved more by drainage than by any other means; manuring is but a secondary article, compared with draining. I calculate that there is in our part of the country as much draining required as would employ half the agricultural labourers for half-a-dozen years at least; but draining land, excepting the carriage of the material, is a landlord's business, and not a tenant's. It appears possible to double the value of some districts by drainage alone; and probably these neglected, undrained districts, amount to half the land in this kingdom. Another important part of the farmer's business, intimately connected with draining, is deep cultivation of the soil, as compared with the poor shallow cultivation now generally practised. Many farmers—cultivators of the soil—dare not plough up the least quantity of clay, or even marl; they have been taught that it is injurious, by their ignorant forefathers, and idle team-men are interested thus to plough shallow, to save their horses the harder labour. But I maintain that deep cultivation is what we want on all good land; and deeper cultivation, with good drainage, on all inferior clay-land. 3d. Mr. Morton, in his remarks "On the Culture of the Land for Wheat," (see p. 74), has hit the mark in every point; his remarks on this subject are exactly parallel with my own experience. I see in the *Gazette*, for March 2, 1844, Mr. Morton is comparing notes with Professor Low upon the farmer's invested capital; now, as the former of these gentlemen makes his estimate at 13*l.* per acre of the land occupied, and the latter gentleman's estimate is 6*l.* per acre occupied. I think if a third came in between, at 9*l.* or 10*l.* per acre occupied, he would be nearer the truth than either. But, after all, it may be set down as a well-known fact, that too many of us farmers are sadly short of capital; and how and when shall we have it? is a very puzzling question. 4th. *Lime.* —The price here is about 10*s.* or 12*s.* per ton, and, at some of the cheapest works or lime-pits, 8*s.* It is common with us to use 3 or 4 tons per acre in liming of fallows, once in ten years; and the best way to use it is to get it well mixed with the soil in the shortest time possible—in a fine dry state, both in the land and the lime.—*A Leicestershire Farmer.*

Hybridising.—As Horticulture and Agriculture are united in the *Chronicle*, I know of no better place to bring forward the subject of hybridising or crossing, as I conceive this is far better understood by the horticulturist than by those engaged in agriculture. I believe there are limits to the productive powers of the earth, but there is no limit to what may be done with the vegetables upon it, so as to assimilate the powers of the soil, more as it were to the use of man. Nearly all the varieties of Wheat, Barley, Oats, &c., are, I believe, accidental varieties. The real staple food for man is left, as it were, to chance, while luxury and elegance can produce almost any tint of colour, or description of taste they want. The greatest pains are taken by the gardener and florist to produce artificially new varieties of vegetables and flowers, and experience proves that this may be done to a great extent; and that species may be moulded almost to the will of the practised hybridiser. If, for instance, we had a variety of Wheat that would ripen two or three weeks earlier in the south of England than those we now possess, we might have an excellent crop of Turnips on the dry lands after it, and on stiff soils succeeded with the Cabbage tribe. Again, if a variety of Wheat could be found to grow and ripen at a higher elevation than any we now possess, it would take, in many places, the place of Oats, and the people in the north might have their Wheaten loaf, instead of Oatcakes and "Bannocks of Barley meal." I trust, therefore, experienced hybridisers, whether horticulturists or agriculturists, will join in this good work, which I think is rather too much neglected by our agricultural Societies, and the result will be to render service and duration to our country's happiness, by meeting the wants of our commerce and population. These remarks were suggested to my mind by hearing a landowner, at a meeting of many hundred farmers, remark that the powers of the earth was limited like our own, and therefore it was of no use to expect greater things of it than we had already seen; and that all he wanted to know was, how to make a dunghill; he ridiculed theorists and German philosophers, as quite unworthy of any confidence; and in all this he was much cheered.—*T. A. F.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held at the Society's House, in Hanover-square, on Wednesday last, the 20th of November. Present—Thomas Raymond Barker, Esq., in the chair; F. Burke, Esq.; James Dean, Esq.; H. Gibbs, Esq.; B. T. Brandreth Gibbs, Esq.; W. Fisher Hobbs, Esq.; Prof. Sewell; W. Shaw, Esq.; J. Villiers Shelley, Esq.; and T. Tweed, Esq.

The following new Members were elected:—
Thruston, John, Market-Weston Hall, Harling, Norfolk
Morgon, William, Brampton Park, Huntingdon
Butler, Captain, Bowling Green, Faringdon, Berks
Hume, John, Beau-Regard, Jersey
Drury, John George, St. George's-street, Canterbury
Perceval, Hon. and Rev. Charles George, Calverton, Stony-Stratford
Davy, Robert, Ringwood, Hants
Robinson, George, Wolverhampton
Humphreys, John, Evan Hall, Oswestry, Salop
Manning, C. I., Cranford Bridge, Middlesex
Bunn, Lockington St. Lawrence, 60, King William-st., City
Price, Walter E., the Elms, Kentchurch, Herefordshire
Garnier, B. N., Drayton Lodge, Norwich
Wingfield, John, Onslow, Salop
Hill, Clement Delves, Sandford Hall, Salop
Harper, George, Belvidere, Whitchurch, Salop
Bick, Michael, Park Hall, Bromsgrove, Worcestershire
Swan, William Robert, Wallsend, Newcastle-on-Tyne
Bate, Robert, the Square, Bridgewater
Paddon, Joseph, Fareham, Hants
Hannay, Rev. James, Ashley, Stockbridge, Hants
Wynne, John Lloyd, jun., Coed Coch, Abergeley, Denbighsh.
Brentnall, Benjamin Fulton, Hemel-Hempsted, Herts.

The names of 18 Candidates for election at the next Meeting were then read.

LECTURES.—Communications were received from the Duke of Richmond and Mr. Pusey, M.P., announcing the progress of the arrangements for Lectures to be delivered before the members at their ensuing Christmas meeting in the second week of December, when the rooms of the Society would be thrown open in the evening as formerly for their accommodation, and the General Meeting held as usual on the Saturday of the same week.

BELGIAN CARROTS AND WHEAT.—Mr. Mechi of Leadenhall-street, favoured the Council with samples of the Belgian Carrot grown on his property in Essex, accompanied with the following communication in reference to their cultivation and that of the Wheat, of which he had sent specimens for their inspection on a former occasion:—

"4, Leadenhall-street, London, Nov. 16, 1844.

"I send a few Carrots of my Tiptree growth. They are the produce of a black sandy field (9 acres) forked 12 inches under the plough, and dressed with dried night soil (which, however, I consider much inferior to guano, so far as I have compared them). They were several times hoed with a deep Bean-hoe. I consider the removal of their lateral fibres obliges the tap-root to go down in search of moisture and food: the same remark applies to Swedes. Had the season been an ordinary one, I should have had an enormous crop of Carrots; but they struggled hard with fourteen weeks' drought, and only then came to one-half or three-quarters of a crop. We filled up the blanks with Swedes. Still they will afford useful food. Forty acres of my Wheat (specimens of which I sent you) averaged over 4 quarters per acre, weighing 64 to 66 lbs. per bushel; (one field produced 5 quarters 1 bushel). The two fields of March-sown Wheat failed, owing to the drought (so many ears being unripe): producing only 2 quarters per acre of middling quality. (Signed) "J. J. MECHI."

The Council ordered their thanks to be returned to Mr. Mechi for the favour of this inspection and communication; and, on the motion of Mr. SHELLEY, it was resolved, that inquiry should be made of Mr. Mechi, whether the four Belgian Carrots he had sent to the Council were fair specimens of the average crop of the nine-acre field referred to in his communication; and also the amount of head and tail Wheat, and off how much land grown.

SOCKET DRAIN-PIPES. — Mr. Henry Dixon, of Witham, in Essex, favoured the Society with specimens of the socket drain-pipes made by him, for the use of his own land; and which, he informed the Council, were particularly applicable to loose springy soils; and, from their construction, could not fail to be safe. He had found that it was not necessary, as some had supposed, to have the pipes made with holes in their sides. The pipes in question might be made of any length, the most convenient ones having been found by Mr. Dixon to be from 15 to 18 inches, and the cost of the socketing, as effected by the Ford's Patent Machine, which he employed, from 2*s.* 6*d.* to 3*s.* 6*d.* per thousand. Mr. Dixon inclosed with the pipes a curious evidence of the facility with which the roots of trees will destroy drains, if carelessly placed: it consisted of a cylindric mass of fibres from the roots of a Willow-tree, growing about 5 or 6 feet from a drain, which had been put down only 12 months; the pipe from which the fibrous collection was taken, was a 4-inch socketed one.

Thanks having been ordered to Mr. Dixon for the favour of these specimens and the communication which accompanied them, Mr. FISHER HOBBS fully corroborated the statement then transmitted to them by Mr. Dixon, whom he well knew as a landowner to a considerable extent in his own neighbourhood, and as a disinterested promoter of agricultural improvement. An interesting discussion then ensued, in which Mr. HOBBS, Mr. SHELLEY, and Mr. DEAN favoured the Council with the results of their own experience in reference to the accumulation of large masses of water, suddenly formed under peculiar local circumstances of surface in the case of continued rains, and also in that of springs issuing in considerable volumes from the sides of hills.

Mr. Shaw presented copies of his Translation of Thaer's Rational Principles of Agriculture, and the Farmers' Almanack for the ensuing year; and Professor Low, of Edinburgh, his work on Landed Property and the Economy of Estates. The following presents and communications have also been received:—

The Health of Towns' Commission: two volumes of their First Report.
Mr. R. N. Bacon: Prize Report of the Agriculture of Norfolk.
Mr. H. Stephens: Book of the Farm, Parts 20 and 21.
Professor Buckland: Address to the Mayor of Southampton and Artesian Well Committee.
Mr. Dollond: Description of an Instrument invented by him, for the self-registering of Atmospheric changes for any period, as indicated by the Barometer, Thermometer, Hygrometer, Electrometer, Rain-gauge, Wind-gauge, and Evaporator, and transferred mechanically, every half-hour, to the self-recording cylinder of the machine.
Mr. Munn: Description of the Bar-and-Frame Beehive, invented by him; and abstract of Wildman's Guide to the Management of Bees.
Geological Society: Proceedings, Vol. IV., No. 98.
Statistical Society: Journal for September, 1844.
Royal Asiatic Society's Journal: No. XV., Part I.
Agricultural and Commercial Society of Guiana: Laws and Regulations.
Royal Society of Lille: Memoirs and Programme of Prizes.
Royal Society of Lyons: Annals of Proceedings.
Highland Society: Quarterly Journal for October.
Farmer's Magazine for October and November.
Veterinarian, for September, October, and November.
Western Agriculturist, No. II.
Jamaica Agricultural Society: Proceedings.
Canadian Agricultural Journal, Nos. VIII. and X.
American Agriculturist, No. X.
Albany Cultivator, No. IX.
Dr. Whitlaw: New York Farmer & Mechanic, No. II.
Mr. M'Nab: North British Cultivator.
Mr. B. Love: Chapter on Working People.
Messrs. Roake and Varty: Mr. Newnham's Pamphlet.
Mr. Skilling: Farmer's Ready Reckoner.
Mr. Saunders: Paul Pry's Letters to his Countrymen (on improving the condition of the Irish Cottager).
Professor Tilley: Inaugural Lecture on Chemistry in Queen's College, Birmingham.
Mr. Westwood Baker: Prizes of Rutland Ploughing Meeting.
Mr. Lilley: Agricultural Tour in Ireland.
Sir John Tylden: on the Conversion of old Hop-bines into Manure.
Messrs. Herring and Co.: Analyses of Guano.
Mr. Morant: on the Quality of Common Salt as a Manure.
Mr. Evans and Mr. Gee: on the Re-publication in Welsh of the Cottage-Tracts on Gardening and Cottage Economy, in the Society's Journal.
Mr. Babington: on the Botanical Designation of Italian Rye-grass.
Mr. Frere and Mr. Testy: on the Mustard-plant.
Rev. Jos. Nodder: on the Distribution of the Society's Journal among Farmers' Clubs.
Mr. Saul: on an Improved Turnip and Potato Machine.
Mr. Bowden: Sample of Mac Kibbin's Improved Roofing Felt.
Mr. Sheppard: on Guano and Gypsum.
Mr. Rea: on Dutch Butter.
Mr. Towers: on Results of Dibbling.
Mr. Wills: on Allotments.
Mr. Waldron: on Drainage of Land.
Mr. Stevenson: on bruising Oats, and on the Subterranean Telegraph.
Mr. White: on Unemployed Labour, and Spade Husbandry.

The Council then adjourned for a fortnight, to the 4th of December.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

AT a late weekly Meeting of the Council, a communication was read from the Trustees of the Agricultural Fund of the Irish Reproductive Loan Society in London, stating that they had agreed to place the sum of 5000*l.* in the hands of the Council, to be hereafter applied to the purposes of Agricultural Education, either in the provinces of Munster or Connaught. The Secretary stated that the premiums, to the amount of 625*l.*, together with 67*l.* in medals, which had been awarded at the late Cattle Show in Dublin, had been paid off, and vouchers received for the same. Prizes to the amount of 40*l.* and upwards still remain unpaid, subject to proof of qualification by the claimants. The whole expenses of the Cattle Show had been also discharged, and a full statement of proceedings would be laid before the Society at the next half-yearly meeting, which was fixed to take place on Friday, the 29th of November, to receive the Report of the Council. The premium sheet for the next

Annual Cattle Show, to be held at Ballinasloe, for the year 1845, was also referred to a sub-committee, to prepare and revise the same, previous to having it submitted to the general meeting for approval. The Secretary also stated that the 2d edition of the Society's Transactions and Report for 1843, together with the maps and diagrams, could be had by members on application, on forwarding tenpence in post office stamps to cover the amount of postage. It was most desirable that this work, which contained so much useful and valuable information on thorough-draining and reclaiming waste land, &c., should be circulated as extensively as possible, and arrangements had been made for the purpose with the Society's publishers—Messrs. Curry, of Dublin; Longman, of London; and Fraser, of Edinburgh—to distribute them upon the most moderate and cheapest terms, where they can be had by non-subscribers on application. It also appeared, on reference to the Society's accounts, that there was a great accession of new members during the present year, no less than 450 additional subscribers having joined the Society at and previous to the late Cattle Show, and upwards of one-half of whom had joined in order to qualify the Local Societies for the premiums this year. There were, however, considerable arrears of subscriptions still due; and the Secretary was directed forthwith to write to the parties, as well as to the subscribers to the local fund for the Cattle Show, to pay up their arrears, in order that a full statement of the accounts should be laid before the Society at the next General Meeting.

Reviews.

The Report of the Agriculture of Norfolk, to which the Prize was awarded by the Royal Agricultural Society of England. By Richard Noverre Bacon. Ridgways. London.

Next to the possession of accuracy and completeness, we may safely assert that the value of a District Agricultural Report depends upon the fullness of detail in which it describes climate, soil, &c.—those circumstances upon which, as well as upon agricultural skill, the character of farming depends*. This is sufficiently obvious; for the usefulness of a publication depends not merely on the quantity and accuracy of its contents, but upon one's ability to avail himself of the information it contains; the system of agriculture it describes may be admirably suited for the district, but if the circumstances under which it occurs be not fully stated, there is no evidence from which the reader may judge whether it be suited to those in which he is placed.

The Norfolk system of agriculture is certainly one which might be safely adopted over large districts in this country; but even here our remarks are true. A report of Norfolk farming would lose much of its usefulness and interest if no such detail of the geographical position, the climate and soils of the county, of the relation existing there between landlord and tenant, of the wealth of its farmers, were given—such an account as should help to explain the high estimation in which it is properly held. Mr. Bacon enters into great detail on most of these points; indeed, the minuteness with which he gives the statistics of the district is tedious to the general reader. We shall extract some statements from his work, showing the condition of the county now, as compared with what it was half a century ago:—

"The progress of production can be very fairly indicated by a reference to the comparative quantities of Wheat sold in Norwich Corn Market:—

Wheat.

	No. of coombs sold.
1805	50,844
10	55,521
11	61,112
12	54,560
39	174,176
40	207,274
41	201,750
42	239,620
43	241,644

Outgoings of a Light-land Farm in Norfolk; 1790 as compared with 1820:—

1790.	£	s.	d.	1820.	£	s.	d.	Increase.
Rent per acre	0	8	3	Rent per acre	0	16	0	nearly 100 per ct

Int. on capital	0	4	4½	Int. on capital	0	7	6	80 per ct.
	£1	15	11½		3	11	4½	
					1	15	11½	
				Difference	£1	15	5	

Over large portions of the county this increased production was owing to the process of claying or marling, which has greatly improved the light soils.

"Mr. Coke, when he inherited his patrimony, exhibited by practice how great benefit was to be attained through the application of clay and marl to the surface soil, and its effects were so momentous that his example was immediately followed throughout the western part of Norfolk, and in some parts of the east. The consequence has been that no county, and certainly no district, exhibits to a greater extent the proof of this application, to be seen in the number of clay and marl pits which abound on every farm."

In the fen districts, where an immense improvement has arisen from this practice—

"The most general system of claying now adopted is, first to set out the land in ridges from fifteen to eighteen yards apart; the men then dig the holes in a straight line along the ridges; they get from eight to nine in a chain of twenty-four yards, the depth of the clay from the surface varies from five to nine feet; when it lies nearest the surface, about one and a quarter loads of solid clay are raised from each of these holes, which costs about 6½*d.*, including the spreading upon the land; but where it lies nine feet, as it frequently does in some parts of the fen, the ridges are made much nearer, for at that depth so much clay cannot be obtained as when it lies fleeter, and the cost is from 10½*d.* to a 1*s.* per hole. Clay is not universally found, sometimes sand and gravel are found in its place, occasionally mixed with strong blue gault, which is not so good as the soft clay. The rotation of crops varies very much where the land has not been clayed; the custom is to plough and burn, and sow Coleseed, which is fed off by sheep. In the spring it is sown with Oats; when this crop is cleared off the land is manured and sown with Wheat. It is then laid down with Grass seed for two years. The third summer it is again ploughed and burned as before. After claying, the plan is to fallow and manure: bone-dust or yard-manure for Coleseed, which is fed off and Wheat sown; the next year Clover again succeeded by Wheat; then fallow or lay down to Grass for two or three years."

But doubtless much of the present fertility of the land is owing to the good yearly management of its tenants, as well as the adoption of permanent improvements—to the adoption of a good rotation of crops, and good husbandry generally, and to the consumption on the land by large numbers of sheep and cattle, not only of the green crop grown on it, but of large quantities of oil-cake. Upwards of 10,000 tons of this material are imported annually into the county; besides this, immense quantities of bone-dust, guano, nitrate of soda, &c., are used. One person alone sells 20,000 tons of the first annually; another sells nearly 3000 tons annually of the last, and of guano he last year sold 750 tons. It is by these means that the farmers of Norfolk have obtained for their county such a high position among the well-cultivated districts of the country.

Mr. Bacon describes in detail the different branches of farming, as conducted in Norfolk; there are in his work chapters on Rotation of Cropping; General Culture, including accounts of the various crops; Manures; Marshes, Meadows, and Pastures; Breeds of Cattle, Sheep, &c.; Feeding Horses; Implements, &c. There is not room for extracts here; and we have no wish, by giving many, to keep our readers from the work itself; but we cannot conclude without citing one passage, expressive of an opinion to the working out of which, under Mr. Coke's patronage, we must attribute the eminence in agriculture which Norfolk has unquestionably attained among the counties of this country:—

"'A large expenditure of money,' says a tenant occupier and an estate agent, 'is necessary to successful farming, and a tenant should always look for a guarantee in proportion to the outlay. An occupier who expects to hold his land but for a year, or to hold it only on such conditions as may terminate his tenure at the year's end, should expend so much only as he may hope to reimburse himself by a year's crop; for all expended beyond that might be thrown away; but such an expenditure plainly could not permanently improve the soil—so of three years, seven years, or any other short term. The farmer, how rich soever he may be, will proportion his expenditure to his interest in the land; but let a tenant have a long and equitable lease, let him feel assured that he has a life-interest in a farm, and he will cast his whole lot with it; then if he be rich and skilful, he will cultivate it to the highest point to which the constantly improving state of agricultural science can direct him. Such is the importance to the whole nation of the tenant's guarantee.'"

* See our last week's Leading Article.

On Landed Property, and the Economy of Estates, comprehending the Relation of Landlord and Tenant, and the Principles and Forms of Leases, Farm-Buildings, Enclosures, Drains, Embankments, Roads, and other Rural Works—Minerals—and Woods. By David Low, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh, &c. &c. Longman, Brown, Green, and Longmans.

We have the pleasure to announce the publication of this important work by Professor Low. It is one of the most valuable contributions to our Agricultural Literature which we have had an opportunity of noticing. We shall not fail, as soon as possible, to give our readers a particular account of its contents.

The Farmer's Almanac and Calendar for 1845. By C. W. Johnson, Esq., and William Shaw, Esq. James Ridgway, 169, Piccadilly, London.

It has an index on its title-page which promises a great deal, but it raises no expectations which are not satisfied by an examination of the contents. Besides a good agricultural calendar, a great deal of matter very useful and instructive to the farmer has been gathered together in this volume. Its advertising sheet is a very interesting and readable addition to it. It certainly continues to be the best Almanac for the farmer that has appeared.

Miscellaneous.

Linseed as Food.—The only apparatus required is a Linseed-crusher, an iron copper, a hand-cup, a stirrer, one or two half-hogsheads, two or three pails, and a wooden rammer. These will cost about 12*l.* Large coppers are found inconvenient for stirring when compounds are made with the meal of Peas, Beans, &c. The sizes most in use contain from 30 to 40 gallons. Upon large farms it will be desirable to have two—one smaller than the other. The stirrer is an iron-ribbed spoon, fastened to a shaft of wood 4 feet long, and somewhat less than the handle of a pick. The rammer is 3 feet long, about 5 inches square at the bottom, and 2½ at the top; through which a pin 14 inches long is passed for the convenience of being used with both hands; mine is nothing more than one end of a broken axle of a cart, with a stick thrust through the linch-pin hole. I commenced winter-grazing this year upon white Turnips grown after Flax, the tops of which, being extremely luxuriant, are cut with Pea-straw into chaff, compounded with Linseed-meal, and given to my bullocks according to the following plan:—Upon every six pails of boiling water, one of finely crushed Linseed-meal is sprinkled by the hand of one person, while another rapidly stirs it round. In five minutes, the mucilage being formed, a half-hogshead is placed close to the copper, and a bushel of the cut Turnip-tops and straw put in; 2 or 3 hand-cups full of the mucilage are then poured upon it, and stirred in with a common muck-fork. Another bushel of the Turnip-tops, chaff, &c. is next added, and 2 or 3 cups of the jelly, as before, all of which is then expeditiously stirred and worked together with the fork and rammer; it is afterwards pressed down as firmly as the nature of the mixture will allow, with the latter instrument, which completes the first layer. Another bushel of the Pea-straw, chaff, &c. is thrown into the tub, the mucilage poured upon it as before, and so on till the copper is emptied. The contents of the tub are lastly smoothed over with a trowel, covered down, and in two or three hours the straw having absorbed the mucilage, will also, with the Turnip-tops, have become partially cooked. The compound is then usually given to the cattle, but sometimes is allowed to remain till cold. The bullocks, however, prefer it warm, but whether hot or cold, they devour it with avidity. The cost for Linseed, according to the above rate of feeding, is 2*s.* 3*d.* per week. It will be seen that the real fattening properties of the above compound centre in the Linseed; and that, in order to produce a greater or less effect, it is only necessary to regulate the quantity of that important ingredient. Also, that Wheat, Oat, and Barley-straw, or Bean-stalks, may be used either with or without Turnip-tops, according to circumstances; nothing more being required than fibrous matter to act as a vehicle for conveying Linseed to the stomach of the animal, and for reconveying it to the mouth for rumination. Unfortunately for the extension of my plans, few really practical agriculturists are disposed to promulgate their own individual success. I subjoin, however, an extract from the letter of a gentleman in Essex, with whose enlarged and philanthropic views I have long been acquainted, and who will rejoice if the simple relation of his own experience should in any way be rendered serviceable to his country:—"My Flax-crop was pronounced by the Belgian agent, at Ipswich, to be as fine as any he had ever seen. It was nearly 4 feet high, very thick in the ground, and perfectly free from weeds. The expenses for harvesting my crop were under 20*s.* per acre. I have laid 10 acres in a hovel and stacked 3 For the want of water I was not enabled to steep any; and shall not now make the attempt till the spring. My experiments with compound last year were satisfactory. I am now feeding 14 horses and colts with straw and hay compound. My plan is, to 8 bushels of cut hay, and 8 bushels of Wheat chaff, are added 28 lbs. of crushed Linseed boiled in 18 pails of water. I give the horses this quantity at night in the yard. In addition, they have one pint of Pea-meal per day, and one hundred weight of straw per week. The boiling Linseed is poured upon the chaff, and both are thoroughly mixed together. I intend giving my young stock 1½ lb. of Linseed-meal with a bushel of chaff daily; my cows the same."—*James Barker, Stour Hall, Ramsey, near Harwich.* A bushel of good Linseed at 5*s.* 6*d.*, weighing 48 lbs., if properly formed into compound with three or four times the weight of Bean, Pea, or ordinary Wheat-meal, and a little more than double the weight of the whole in water, will cost about 2*l.* 15*s.* per ton.—*John Warnes, in the Farmer's Journal.*

How to Know Good Guano.—The farmer should never purchase guano, except its composition be warranted by the analysis of a competent chemist. He should cork up in a bottle a half-pound sample of each kind of guano that he buys; and if his crop should disappoint reasonable expectation, he should cause the samples to be analysed; and should the result not correspond to the analysis exhibited at the sale, he is fairly entitled to damages for the loss of his labour, rent, crop, &c. The necessity of following this advice will appear on considering the delusive, if not utterly false, analyses under which cargoes of guano have been too often sold. In a recent case which came under my cognisance, in consequence of having been employed professionally to analyse the identical cargo, I found the guano to be nearly rotten and effete; containing altogether only 2½ per cent. of ammonia, ½ per cent of urate of ammonia, nearly 9 of sea-salt, 24 of water, and 45½ of earthy phosphates. Now, this large cargo of many hundred tons, fetched a high price at a public sale, under the exhibition of the following analysis:—

Urate of ammonia, ammoniacal salts, and decayed animal matter	17.4
Phosphate of lime, phosphate of magnesia, and oxalate of lime	48.1
Fixed alkaline salts	10.8
Earthy and stony matter	1.4
Moisture	22.3
	100.0

The purchasers, I was told by the brokers, bought it

readily, under a conviction that the guano contained 17.4 of ammonia, though the proportion of ammonia is not stated. By the following hypothetical analysis much guano has been well sold:—"Bone earth, 35; lithic acid, &c., 15; carbonate of ammonia, 14; organic matter, 36=100." I am quite certain that no sample of guano can contain 14 per cent. of carbonate of ammonia—a very volatile salt. We shall see presently the state of combination in which the ammonia exists. It may contain at the utmost 5 per cent. of the carbonate; but such guano must have been acted upon powerfully by humidity, and will, therefore, contain little or no uric acid. In the very elaborate examination of guano by T. Oellacher, apothecary at Innsbruck, published in a recent number of Buchner's "Repertorium of Pharmacy," it is said, that if a glass rod dipped into muriatic acid be held over guano, strong fumes are developed; and the solution of guano has an alkaline reaction with litmus paper. These phenomena evidently indicate the presence of carbonate of ammonia, and of course a partially decomposed guano; for sound Chincha and Bolivian guano have an acid reaction, proceeding from the predominance of phosphoric acid. Farmers frequently judge of the goodness of guano by the strength of the ammoniacal odour; but in this judgment they may egregiously err, for the soundest guano has no smell of ammonia whatever; and it begins to give out that smell only when it is more or less decomposed and wasted.—*Dr. Ure, in Pharmaceutical Journal.*

Notices to Correspondents.

RURAL CHEMISTRY.—By R. Solly, Esq. F.R.S., Experimental Chemist to the Horticultural Society of London, Honorary Member of the Royal Agricultural Society, and Lecturer on Chemistry at the London Institution, may be had of all booksellers, price 1s. 6d.——*F. M. C.*'s communication on Draining shall appear next week. Many thanks for the hint.

AFTERMATH, &c.—*Querist.*—We have by us numerous hay-crop, and value of aftermath on several fields. They stand thus:—

Crop 25 cwt.—Aftermath	14s.	Crop 15 cwt.—Aftermath	14s
,, 12 ,, ,,	8s.	,, 20 ,, ,,	14s
,, 20 ,, ,,	12s.	,, 15 ,, ,,	14s

And so on. The following is the estimate of the gross produce in various districts among three classes—Landlord, *i. e.* Rent and Taxes; Farmer, *i. e.* Farmer's Profits; Labourers, *i. e.* Wages and Expenses of Cultivation:—

PER ACRE.

Gross Produce	Rent, &c.	Profit.	Labour.	Gross Produce	Rent, &c.	Profit	Labour.
75s. 8d.	45s.	17s. 1	13s. 8d	96s. 0d.	32s.	15s	49s. 0d
76 2	38	14	24 2	69 3	28	14	18 3
82 8	18	13	51 8	116 0	35	20	61 0
58 2	25	12	21 2	63 9	18	13	32 9
98 7	39	15	45 7	105 6	30	15	59 6
44 0	20	12	12 0	67 0	28	14	25 0
82 6	30	16	16 0	72 10	30	16	26 10

If these estimates be correct, owing to some of the districts being arable and others pasture, you see what a wide field is; we never heard of Horse Chesnuts being used, but should think they might, for pigs, sprout them first. About Potatoes—If the average crop be 80 bags per acre, then the expenses being as below—two ploughings 16s., manure 56s., seed 30s., planting 14s., hacking and moulding up 14s., harvesting and pitting 10s., rent and taxes 45s., amounting in all to 10*l.* 15s., they will [illegible] this supposing them to receive [illegible]. One [illegible] weighing 60 lbs. produced on an average 25½ lbs. of best flour, 22½ lbs of seconds, 10½ lbs. of bran, and 1 lb. of pollard at at —— mills.

AGRICULTURAL MACHINES.—*Philla.*—Our Papers on this subject will include all known agricultural machines, but we cannot fill our columns with them to the exclusion of other matter. We have a lot of matter on "the plough" by us, which must appear in the 2d section of the Paper, before we can proceed to the other implements of cultivation.

BENCRAFT'S PATENT HAMES.—*W.*—Where can any description of "Bencraft's Patent Hames" (mentioned approvingly by Mr. B. Chilo, p. 740), be found? and where can the article be purchased?

COW-FEEDING.—*Subscriber.*—2 cwt. of hay per week, 8 or 9 cwt. of Swedes per week, probably rather less of Carrots, and fully as much of Cabbages, would any of them keep a full-sized cow in condition. 10 or 12 lbs. of hay, and 60 or 70 lbs. of a mixture of Mangold Wurzel and Parsnips would be excellent food for a cow, both in quality, and, *per diem*, quantity.

ELECTRICITY.—*Carey Tyse.*—The account you allude to was inserted in the *Agricultural Gazette*, see page 741.——*J. S.*—If on the one side of a mass of damp earth, you place a zinc, and on the other a copper plate, and connect them over head by a conducting wire or metallic ribband, a current of electricity will circulate through it.

EXPENSES OF CULTIVATION.—*W. W.*—Your little farm will probably cost you as follows:—Wheat 1½ acres, cultivation and harvesting, 2*l.* 10*s.* Barley, 1 acre, 1*l.* 15*s.* Potatoes, three quarters of an acre, 5*l.* Turnips, three quarters of an acre, 5*l.* Grass land, 4 acres, 2*l.* 10*s.* In all, 16*l.* 15*s.*, seed and rent being excluded from consideration. If your man has not got horses to attend to, he and a boy for a month at Potato-planting time, and some men a few days at haymaking and Corn harvest, should manage it all. We have said nothing as to manure; you will be able to make enough off the produce. You will be well able to keep the stock you name.

FENCES.—TO READERS.—*J.H.*—What is the best and cheapest fence for land near a town, on a dry earth bank, 2 or 3 feet above a bye-lane?

GRASS-LAND.—*C. W. J. L.*—Very little management is required. Manure it sufficiently in October every year. Keep the ditches open, and the fences trimmed. Cut off Thistles, &c. whenever they appear. Scatter the droppings of the cows. Bones are a good manure; a quarter, annually, of fine bone-dust with perhaps 1 cwt. of guano per acre, mixed thoroughly with whatever earthy matter you may apply, would be a rich manuring.——*J.H.*—You may calculate upon a good crop of Potatoes next year, and nothing will pay you better—if you pare now, and let it lie and rot till early March, then dig the ground over and turn in the half-rotten turf—plant the Potatoes in April. Lime is best applied to Grass land in the form of a compost, with vegetable mould. See Sprengel's Papers on the subject, in the *Gazette*, some months ago: 80 to 100 bushels per acre,—4 or 5 tons, are a good dressing. Your Lucerne not having ripened its seed, is probably the consequence of your climate, and not a proof of its being a distinct variety.

HORSE CHESNUTS.—*A. E.*—Soaking them in lime-water will not, that we are aware, correct bitterness—it might correct acidity. The most probable way to give them sweetness is to sprout them, as was recommended in the case of Acorns. Their shells are worthless as food. To convert leather into manure, it must be decomposed in some way—try chopping it up and mixing in a dung-hill; after all it is not likely to be worth much.

LIQUID MANURE.—*H. C. S.*—Every now and then pour in a little sulphuric acid till effervescence subsides; twice the quantity of sulphate of iron will be needed, dissolved in as little water as possible, and then no effervescence takes place, as in this case the iron takes up the carbonic acid, which in the other escapes. In both cases the same result will follow; the ammonia is fixed as a sulphate—it loses its smell. We know nothing of Hallett's Equa guano.

MANURES.—*Mellifluus*—You may apply the salt and lime some two or three weeks before the pigeons' dung, mixing it well with the soil; and it will then not be likely to drive off any of the volatile ingredients of the rest of your compound.

MATERIALS OF GOOD SOAP-BOILING COMPOSITION.—*Peter L.*—White arsenic, 1½ ounce to be put in a bag and boiled for half an hour in a gallon of water, 2 ounces of tobacco with 5 ounces of soap, to be also boiled in the same quantity of water, and then mixed together, adding 2 gallons of water. This will be sufficient for from 16 to 20 sheep; the mixture may therefore be increased in the quantity required, so that a pound of arsenic will suffice for 150 sheep. Care must be taken that the head is not dipped; but the wool must be thoroughly saturated. Your address of Mr. Biggs is very convenient, and his preparation is said to be effectual. *W. C. S.*

MILL FOR CRUSHING FLAX-SEED.—*Cottager.*—Apply to several of the first rate agricultural implement makers on this subject. If, as it is probable, they have such implements on sale, they will be able to refer you to their customers, from whom you can get a character of these, and then choose for yourself. It is obvious that this is the only way in which we can answer such questions. The announcement of implements on sale by this or that person renders us liable to advertisement duty.

MOSS.—*Subscriber.*—See page 778, article Moss. Caustic lime in the ordinary agreeable application has, in some cases, destroyed Moss.

NEWLY-INCLOSED LAND.—*H. H.*—Will "M. D. P." for the benefit of our correspondents who may be disposed to [illegible] on the process of bringing such land into [illegible], inform us exactly how he is situated, detailing [illegible]

[illegible] alternate cropping with Wheat and [illegible] neighbourhood of towns, the most profitable. Take Potatoes as the first [illegible] ate husbandry by setting only [illegible] Wheat next year.

OATS.—*H. W.*—That is not necessarily, for cattle, the best variety which is of the best quality; nor is that necessarily the best which is the most productive variety; but that which produces most nourishing matter *per acre*. In general, however, productiveness is a safe criterion to judge by, for varieties differ much more in this than they do in quality. One of the best varieties we know is the Irish White-apple—a large, productive, white Potato.

POTATOE SEED.—*A Farmer*—asks the best way and time to gather, preserve, [illegible] Potato-seed.

RAPED MARL.—*T. Randell.*—So far as one can judge from the small specimen, it does not appear likely to be beneficial either burnt or unburnt.

SALT.—*J. Robinson*—Five or six cwt. per acre of salt is much too large a quantity. In theory it would supply a much larger quantity of soda and chlorine than any crop is likely to require, and in practice we know of no successful trials of such large quantities, except upon such light gravelly soils as we may suppose had two thirds of whatever was applied washed out of them by the first rain. You may mix one, or perhaps two cwt. with the quantity of gypsum you intend [illegible], and spread it broadcast over young Clover in spring. Two and a half cwt. of guano and 2 cwt. of gypsum, which you intend to apply, mixed with 2 cwt. of salt at the most, will be an efficient manuring.

TO PUT A COLT [illegible].—Moderate bleeding and a dose [illegible] for the purpose; but if any are used, try powdered catechu, 1 drachm; powdered ginger, half a drachm; tincture of opium, one ounce, in gruel [illegible] three times a day. [illegible] *W. S.*

TRANSMUTATION OF SPECIES.—*Catkin.*—The Oats should, we suppose, be sown at their usual seed-time—March. Any kind will do. See Leader of some weeks back on this subject—Horticultural side.

*** As usual many communications have been received too late.

Markets.

POTATOES.—SOUTHWARK WATERSIDE, NOV. 18.

At the early part of the week there were few arrivals from the southern and western districts; at the close some cargoes made their appearance from the northern districts, yet the number of arrivals has been inconsiderable. The best samples of Reds were in great request, and the following prices fully maintained; but the advance in price is occasioned by the shortness of the supply.

York Reds	-	-	60s to 70s	Kent and Essex Whites	-	50s to 55s
Perth	-	-	60 —	— — Kidneys	-	60 —
Lifeshire	-	-	— —	Wisbeach Kidneys	-	60 —

— Whites		-	45 50	Prince Regents	-	60 —

HOPS, FRIDAY, NOV. 22.

THE Hop duty was declared on Saturday last at 110,322*l.* 17*s.* 2½*d* 12 20ths, since which time our Market has taken a favourable turn, and prices are better, say 2s to 4s per cwt, with every prospect of a farther advance; for beside the stock on hand being less than for many years past, the consumption is increasing in London and the manufacturing districts; and should the Tax on Malt be repealed next Sessions (which we think probable), the consumption of Malt and Hops would go on rapidly to increase, giving additional employment to thousands of industrious families, and enable them to drink home-brewed beer as formerly. We find that in five years ending 1839, the annual average Old Duty on Hops was 198,246*l.* 2*s.* 6½*d.*; five years ending 1841 only 1[illegible],736*l.* 6*s.* 4½*d.*

PATTENDEN & SMITH, Hop-Factors.

SMITHFIELD, MONDAY, NOV. 18.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3 10	to 4s	0	Best Downs & Half-breds	3s	10 to 4s	2
Best Short Horns	3 8	3	10	Best Long-wools	3	8 4	0
Second quality Beasts	2 6	3	0	Ewes and second quality	3	0 3	6
Calves	3 4	4	0	Pigs	3	4 4	4

Beasts, 3003; Sheep, 27,390; Calves, 151; Pigs, 375.

Although we have a few more Beasts to-day than last Monday, yet the increase not being in the best qualities, that description of stock fully maintains its price, and in some instances we have observed a little advance on a choice article. Second-rate Beasts seem to be worth less than ever, and the difference between this quality and the best becomes daily more apparent. The town appears to be glutted with middling meat. The supply of Sheep is somewhat shorter, but the time of year has arrived when less Mutton is wanted; there is therefore fully sufficient for the demand. The weather continuing so mild makes trade heavy, except for the best qualities. Good old Downs are in request and readily make 4s 2d, and some of the most selling Longwools make 4s. Ewes and Middling Sheep are still very unselling. Veal trade is very heavy; a very good Calf with difficulty makes 4s. Pork-trade is very dull, owing to the mild weather.

FRIDAY, NOV. 22.

There being a favourable change in the weather since Monday, and the supply to the dead markets having been much shorter, we have an opportunity of getting clearer of the middling meat, which we have been so long over stocked with; but it is still worth very little money; and as the quality of the supply of Beasts does not seem at all to improve, there still threatens to be a vast difference between the first and second rate. The best Scots, &c. are making to-day about 4s 2d, Short Horns nearly 4s, and second qualities range from 2s 8d to 3s 4d per 8 lbs. There is a very decided improvement in the best qualities, and everything better. The supply of Sheep is short and the trade about the same as Monday. Good Downs in some instances have made nearly 4s 4d; the best Longwools make 4s; large Sheep about 3s 8d. We have a better clearance of Ewes and Middling Sheep at from 3s 2d to 3s 6d. There is rather a brisk demand for Veal to-day, the supply being short and the weather good; a nice Calf is worth about 4s 4d per 8 lbs. The weather is very favourable to the Pork trade, and nice Porkers are worth 3s 8d to 4s 4d.

Beasts, 702; Sheep, 3550; Calves, 151; Pigs, 575.

4*l*, West Smithfield.

MARK-LANE, MONDAY, NOV. 18.

FROM Essex, Kent, and Suffolk the supply of Wheat was very short, and much affected by the weather, but there is a large arrival from Lincolnshire since Saturday, which has an effect upon the Market; the best dry samples remain the same, but anything below that quality is a dull sale and cheaper; for Foreign there is a retail demand at late prices. Country Flour is [illegible] worth 24s. to 26s. per barrel. Malting Barley is a dull sale for the fine qualities, secondary parcels are very unsaleable, but there is more inquiry for grinding sorts at our quotations. White Boiling Peas sell readily, Grey, and Beans remain as last week. Oats are rather flat owing to considerable arrivals from Ireland.

FRIDAY, NOV. 22.

THE great bulk of the arrivals of Wheat being from Cambridgeshire, and having gone direct to the Mills, the quantity of English offering this morning was small, and we observe no alteration in the value either of that or Foreign, the latter being in very limited demand. Barley generally is a dull sale, and barely supports Monday's quotations, excepting sweet Foreign of secondary quality, which sells readily. Beans are unaltered, but Peas, particular feeding qualities, are a dull sale, and rather cheaper. In Oats there is very little doing, but holders are firm in resisting a decline.

		,, Inferior	— —		

COVENT GARDEN, NOV. 23.—The supplies during the week have been good, and the prices of most articles remain the same. Owing, however, to the late wet weather, trade has been far from brisk. Of fruit, Pine-Apples of good quality are tolerably plentiful, and amongst them are some fine specimens of good cultivation. The supply of hot-house Grapes is rather limited, but foreign ones are quite sufficient for the demand. Among Apples we noticed some very fine specimens of the American Newtown Pippin; and among Pears excellent samples of Marie Louise and Glout Morceau may be met with. A considerable quantity of Pomegranates are in the market; and Medlars are also plentiful. Quinces are somewhat scarcer. Oranges are abundant, as are also Chesnuts; other Nuts are likewise well supplied. Plums are now over, or nearly so, for a season. Among Vegetables little variation has taken place. Broccoli is somewhat scarcer; but Cauliflowers are sufficient for the demand. Cabbages, Savoys, and other winter greens, are abundant and good in quality, and fine samples of Celery are also offered. Lettuces, Endive, and salading of almost every kind are plentiful, and good in quality. Mushrooms are tolerably abundant. Cut flowers chiefly consist of Chrysanthemums, Heaths, Camellias, Cinerarias, Heliotropes, Mignonette, Cyclamens, Chinese Primulas, Auriculas, Gardenias, Neapolitan Violets, and Roses.

FRUITS.

Pine Apple, per lb., 8s to 7s 6d
Grapes, Hothouse, p. lb., 1s 6d to 5s

Tomatoes, per half-sv., 2s to 2s
Capsicums, Ripe, per 100, 4s to 8s
— Green, per 100, 1s to 2s
Radishes, per doz., 6d to 1s
Lettuce, per score, 6d to 1s 6d
Celery, White, per bunch, 6d to 1s 6d
— Red, per bunch, 9d to 2s
Endive, per score, 1s to 1s 6d
Mushrooms, per pottle, 10d to 1s 6d
Small Salads, per punnet, 2d to 3d
Watercress, p. 12 sm. bun., 3s to 6d
Parsley, per doz. bunches, 2s to 3s
— Roots, per bundle, 9d to 1s
Tarragon, Green, per bunch, 2d to 3d
Green Mint, per bunch, 2d to 3d
Marjoram, per bunch, 2d to 3d
Chervil, per punnet, 2d to 3d
Chilis, per 100, 1s to 2s

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	
Garden Edging	Orange Tubs, Flower Boxes, &c.

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

MEALY-BUG, THRIPS, &c.—HEREMAN'S DILUTION will effectually extirpate these pests; sold in bottles at 1s and upwards each, the purchaser to pay the carriage. Address, with a remittance, either to Messrs. MARNOCK and MANLEY, Nurserymen, Hackney, London; or to SAMUEL HEREMAN, Florist, &c., Well-hall Gardens, Eltham, Kent, of whom may be had Cabul True Winter, and many other of the choicest Melons, at 1s. per packet.

INSTANTANEOUS DEATH.

E. L. BROWN's VEGETABLE EXTRACT, for the Instantaneous Destruction of the MEALY-BUG, White and Brown Scale, American Bug, and all other Insects injurious to Trees and Plants—Pines in particular. Orders punctually attended to, on the remittance of a Post-office order for the amount. Manufactured and sold only by E. L. BROWN, Chemist, Leyton, Essex. Bottles, 3s 6d.; Half-pints, 6s.; Pints, 10s.; and Quarts, 16s., with full directions for use. The above article has frequently been used, and highly approved of by the following well known practical men.—Mr. Fraser, Nurseryman, Ley Bridge-road, Leyton, Essex; Mr. John Kyle, Gardener to R. Barclay, Esq., Leyton, Essex; Mr. Kynock, Gardener to W. T. Copeland, Esq, M.P., Leyton, Essex.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery: they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 2000 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale.

Materials may be had for those who wish to fix their own Apparatus.

THE TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

IRON HURDLES, best Wire for Strained Fencing, Ornamental Iron and Wire-work, Garden Chairs, &c., &c., and every description of Implement for AGRICULTURAL and HORTICULTURAL PURPOSES.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where a large assortment of the above can be seen.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much approved method of applying the Tank system to Pineries, Propagating Houses, &c. by which atmospheric heat as well as bottom-heat is secured to any required degree without the aid of pipes or flues. S. & Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. & Co. beg to inform the Trade that at their Manufactory in New Park st., every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c. of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field, and Garden Fences, Wire Work, &c. &c.

GUANO for SALE, in Bags of 1 cwt. each, just landed, with a succession of cargoes to arrive.—Successive years' experience has unquestionably proved that Genuine Guano is the simplest, cheapest, and best Manure within the reach of the Agriculturist. The only reasonable anxiety which now remains is to procure the Guano unadulterated, and to obtain such practical directions for using the Manure as shall fully develop its productive powers. To secure to buyers these indispensable requisites, with each purchase will be given a warranted chemical analysis of quality, and also a copy of the recently published Pamphlet, "Practical Instructions for using Guano as a Manure, illustrated by Practical Results."

Large parcels will be delivered direct from the ship or waterside premises; smaller quantities may be had at the warehouses, 24 and 25, Billiter-street, or delivered within any reasonable distance at a trifling additional cost. Apply to JAMES CLARK, 24, Billiter-street, Forchurch-street, London.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE Attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

IMPORTANT TO AGRICULTURISTS, &c.

ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Messrs. MITCHELL and FIRTH (late Mr. Mitchell), Analytical Chemists, with the view of ascertaining whether the Soil, in which it is proposed to grow any particular crop, contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.—No. 5A, Hawley-road, Kentish Town.

TANNER'S VITREOUS CLOTH, a SUBSTITUTE for GLASS for HORTICULTURAL PURPOSES.—The above recommends itself to the notice of Florists and Horticulturists, as producing effects superior to Glass, at a less expense. The support the Proprietor has received from very many highly respectable Florists encourages him to consider that his labours have not been misapplied in bringing before the public an article so generally required. Price of cloth, 7-8ths of a yard wide, thin, 2s. 6d. per yard.; stout, 3s. 1 yard wide, 3s. 6d. Price of Fluid (for renewing the cloth after lengthened service), 4s. 6d. and 2s. 6d. per bottle. Manufactured only by N. W. TANNER, Chemist, Exeter: and Sold by Messrs. Butler and Muckley, Covent-garden, London; Mr. Cunningham, Paradise-street, Liverpool; Messrs. Lucombe and Pince, Exeter Nursery.

AGRICULTURAL DRAINING. — THE DERBY LEVEL.—The attention of persons Draining their land is directed to this efficient but simple Instrument, presumed to be all that can be required for the purpose, and its price such as to place it within the reach of all. To be had of the Maker, J. DAVIS, Optician, Derby.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO GARDENERS, NURSERYMEN, AND OTHERS.

F. M'NEILL & CO., of Lamb's Buildings, Bunhill-row, London, Manufacturers, and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Sheds, Verandahs, &c., and for Protecting Plants, and Covering Garden Frames, beg to call the attention of Gardeners and others to their superior article, which has been exhibited at the Great Agricultural Shows of England, Scotland, and Ireland, and OBTAINED the PRIZE for being the best and cheapest article for roofing, &c. It has been tested in the gardens of several noblemen and gentlemen in the neighbourhood of London, and in different parts of the country, to whom reference can be made. The Felt is impervious to rain, snow, and frost, and a non-conductor of heat and sound. Its advantages are Lightness, Warmth, Durability, and Economy.—Price ONLY ONE PENNY PER SQUARE FOOT.

Samples, with directions for laying on, and testimonials as to its merits, sent free to any part of the town or country.—Patent Felt Works, Lamb's Building, Bunhill-row, London.

IMPROVED ROOFING FELT.

McKIBBIN'S PATENT ROOFING FELT

Is particularly applicable as a Substitute for Slate, Zinc, Tiles, Thatch, and other Articles used for Roofing, from its Economy, Durability, and Lightness. It is quite impervious to wet and damp, resists the heat of the sun, and is a non-conductor of heat or cold. Besides the economy in repairs, the timber where it is used may be so light as to save its whole expense. It requires no other coping, and by attention to printed directions may be applied by a common labourer. It is free from breakage and contraction, like zinc, and requires neither painting nor coating. It is now in very general use for Roofing Houses, Verandahs, Sheds, Workshops, Ropewalks, Railway Stations, Icehouses, &c. &c., and for protecting Plants, covering Garden Frames, Corn, and Hay Ricks, the top and sides of Sheep-folds; and to Emigrants it provides a cheap, warm, durable, and portable Roof.

This Improved Roofing Felt is much more durable than the common Felt, made in lengths, not being subject, like it or other materials in continuous lengths, to be stripped by storm; and being fastened down at the overlaps only, the wet cannot percolate through the nail-holes.

TESTIMONIAL.

London, Nov. 1. 1844.

H. C. BOWDEN, Esq., Agent for Mc KIBBIN'S Roofing Felt.

It is with much pleasure I add my humble testimony to the superiority of your Felt over any other preparation of the kind with which I am acquainted. This Testimony I give with the greater cheerfulness from the many reports I have heard in its favour, and from the likelihood of its being used extensively in Agricultural purposes. I shall not fail to notice it in my lectures when on the subject.

(Signed) JOHN ROBINSON, M.B., Senior Lecturer on Chymistry, &c. as applied to Agriculture and Rural Economy in this Kingdom.

Sold in sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet).

Apply to H. C. BOWDEN,
Agent to the Manufacturers,
No. 18, East India Chambers, Leadenhall-street, London.

WHITNEY'S PATENT CLOTH for COVERING GREEN-HOUSES, CUCUMBER or MELON PITS, &c. This Cloth is made expressly for the purpose of applying Whitney's Composition upon, and is much more durable than any other material: when coated it is beautifully white and transparent. The perfect success of Whitney's Composition for all Horticultural purposes cannot be more fully established than by stating, that, on the 1st of April last, a Black Hamburgh Vine was set in a border, the stem introduced into a house covered with Calico, and coated with Composition. On the 1st of Sept. a bunch of Grapes was cut weighing 6½ ounces, the fruit was finely coloured, and the flavour pronounced to be excellent. A sample was sent up to the Editor of the *Gardeners' Chronicle* for his inspection. The tree grew very luxuriantly, the foliage very fine, and the wood ripened exceedingly well. As a winter protection it is infinitely warmer than glass.

The PATENT CLOTH and COMPOSITION can be obtained of Messrs. Butler & Muckley, Covent Garden Market; Hurst & M'Mullen, Leadenhall Street; Warner & Warner, Cornhill; Barclay & Sons, Farringdon street; and Tannay & Co., Oxford Street. — Wholesale and Shipping Agent, Mr. Barclay, Wolverhampton.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus; and B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet street.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June 6*, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent [illegible] to Captains and Passengers, for its capital flavour, and as the [illegible] accompaniment of its kind for a voyage. JAMES HOSKEN."

"One of the [illegible] of this luxurious and epicurean age is [illegible] Worcestershire Sauce, adapted to fish, flesh, fowl, [illegible] far superior to the long-established favourites, [illegible] and of less cost."—*Naval and Military Gazette*, April 6, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

IMPORTANT to the FASHIONABLE WORLD.—By far the most influential of all the graces that contribute to personal adornment is the Hair. Its recovery, preservation, and improvement proportionably concern the élégantes of our fashionable circles, and any information which will insure these desirable results will be hailed as an inestimable boon. The following extract from the letter of a respectable chemist in Bridlington will be read with the highest interest:—

"A lady, a customer of mine, has found great benefit from the use of your Balm. About six months ago her hair nearly all fell off. I recommended her to try your Balm of Columbia, which she did. In the course of a few applications the hair ceased to fall off. Before she had used one 3s. 6d. bottle it began to grow very profusely, and she has now a very beautiful head of hair. "I am, gentlemen, yours respectfully,

"WM. SMITH,
"Chemist and Druggist, Market-place, Bridlington.
"To Messrs. C. and A. Oldridge.—March 13, 1844."

C. and A. OLDRIDGE'S BALM of COLUMBIA causes the Hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again; it also prevents grayness. 3s. 6d., 6s., and 11s. per bottle. No other prices are genuine.

OLDRIDGE'S BALM, 1, Wellington-street, the second house from the Strand.

HORIZONTAL WATCHES, very flat. — A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank. Price, in silver cases, three and a half guineas each; or in gold cases, six guineas each. These Watches are accurate and durable, the horizontal escapement being peculiarly suited to combine those important requisites. They are jewelled in four holes, and continue going whilst being wound. A twelvemonth's warranty given with each.

PATENT ELECTRO-PLATED AND GILT ARTICLES in every variety, at the Establishments of the Patentees, ELKINGTON and Co., West End—22, Regent-street, corner of Jermyn-street; City—45, Moorgate-street. The Patent Electro processes being extensively adopted under their licence, the Patentees beg to state that they confine their own manufacture to goods of a superior and warranted quality only, which invariably bear their mark, "E. and Co." under a crown. Old articles replated and gilt.

ELECTRO-PLATING AND GILDING.—OLD PLATED GOODS RESTORED and made equal to new by Messrs. ELKINGTON and Co.'s Patent Process. This process being carried on in London *only* by *Messrs. Elkington and Co.*, it is particularly requested that all goods may be forwarded direct to their Establishments, 22, Regent-street (corner of Jermyn-street), or 45, Moorgate-street, City. New goods Plated upon White Metal in great variety. Books of Prices and Drawings sent to all parts of the kingdom and abroad free.

REAL SHEFFIELD PLATED DISH COVERS, at prices hitherto unattempted. THOMAS WEST, 18, Ludgate street, London, having received a large supply direct from the manufactory at Sheffield, offers the best Meat Dish Covers, as follow.—Cottage Pattern—1 Cover of 20 inches, 3l. 19s.; 1 do. of 18 inches, 3l. 7s.; 2 do. of 14 inches, 4l 8s.; the set of 4, complete, 11l. 10s. ONLY. Double Dome Pattern—1 Cover of 20 inches, 4l. 16s.; 1 do. of 18 inches, 3l. 19s.; 2 do. of 14 inches, 5l. 5s.; the set of 4, complete, 14l. ONLY. In noticing the prices of the above goods, T. W. ventures to assert they are superior to many advertised at a much higher price. Best Wrought Silver Spoons and Forks as usual, Fiddle Pattern, 7s. 2d. per oz. Queen's Pattern, 7s. 4d. per oz. Superior Watches and Fine Gold Jewellery, cheaper than any house in London. West's Hand-book, with 100 Engravings, and full of useful information, is just published, and may be had gratis, and post free, on application to T. WEST, Silversmith, 18, Ludgate-street, London.

OBTAINABLE FOR NOTHING. — The Nervous are respectfully invited to send to Rev. Dr. WILLIS MOSELEY, 9, Charlotte-street, Bloomsbury, London, for the small Pamphlet just published, on his most successful treatment of Nervous or Mind Complaints, by which he cures these Diseases as certainly as water quenches thirst, which Pamphlet he will return, if a stamp is inclosed, free of charge.

NATIONAL TESTIMONIAL

Postage Stamps, Post-office Orders, &c., sent to the Secretary, MR. GEORGE WANSEY, Solicitor, 3, Moorgate street, London, will be duly acknowledged.

In one thick vol., a New Edition, being the Ninth, much enlarged, price 16s.,

MODERN DOMESTIC MEDICINE: A POPULAR TREATISE, exhibiting the Symptoms, Causes, and most efficacious Treatment of Diseases; with a Collection of Approved Prescriptions, Management of Children, Doses of Medicines, &c. Forming a comprehensive Guide for the Clergy, Families, and Invalids. By T. J. GRAHAM, M.D., &c. "It is evidently the result of great professional talent, experience, and judgment; the author everywhere appears conscientious and candid. *One object* is prominently evident—a sincere desire to benefit his suffering fellow-creatures. To recommend a work like the present to our readers, is only to manifest a proper regard for their welfare."—*Literary Journal*, Feb. 1843.

"It is altogether deserving of permanent popularity."—*London Weekly Review*.

SIMPKIN & Co., Paternoster-row; HATCHARDS, 187, Piccadilly; and TEGG, 73, Cheapside. Sold by all Booksellers.

Also, by the same Author, in 8vo, price 11s., Third Edition, enlarged,

2. ON THE DISEASES OF FEMALES: a Treatise, illustrating their Symptoms, Causes, Varieties, and Treatment. With numerous Cases, and a Medical Glossary. Including the Diseases and Management of Pregnancy and Lying-in.

"It contains a mass of information indispensable to those for whom it is intended, and surpasses in value any other book of its character."—*Blackwood's Lady's Magazine*.

NEW WORK ON AGRICULTURAL CHEMISTRY.
Just Published, in 1 vol. post 8vo., 7s. 6d. cloth lettered,

LECTURES to FARMERS on AGRICULTURAL CHEMISTRY. By ALEXANDER PETZHOLDT.

CONTENTS: Introduction, Atmosphere, Water, Soil, Constituents of Plants, Sources of the Carbon of Plants, Oxygen, Hydrogen, and Nitrogen of Plants, Inorganic Constituents of Plants, Ashes of Plants, Fallow, Rotation of Crops, Manures, Vegetable Manure, Animal Manures, Mineral Manures; Appendix, Guano.

"The author does not overload his subject with needless details, which is the vice of some such books, but he confines the reader to those points only which he ought to be well acquainted with, and these he explains in a clear and simple way."—*Gardeners' Chronicle*.

Printed for TAYLOR and WALTON, 28 Upper Gower-street.

HEATING BUILDINGS BY HOT WATER.
Now ready, SECOND EDITION, greatly enlarged, with numerous woodcuts, &c., 8vo. price 10s. 6d. cloth,

A PRACTICAL TREATISE on WARMING BUILDINGS by HOT WATER; on Ventilation, and the various Methods of Distributing Artificial Heat, and their Effects on Animal and Vegetable Physiology. To which are added an Inquiry into the Laws of Radiant and Conducted Heat, the Chemical Constitution of Coal, and the Combustion of Smoke. By CHARLES HOOD, F.R.S., F.R.A.S., &c.

WHITTAKER AND Co., Ave Maria-lane, London.

JUST PUBLISHED,

AN ESSAY on the Latest Improvement on the Culture of Wheat Sowing, Drilling, &c.; also of Barley, Beans, Peas, Seeds, &c., (and for Gardeners and Nurserymen's purposes invaluable, as the land is cleared at much less expense from weeds, &c., being a great saving in seed and producing greater crops, by adopting the new principle, and which is suitable to all soils. And a small model, with full instructions to make the same, at the cost of 1½s. to 2s. Gypsum for land, and for staying the ammonia, &c., in Manure hills, Stables, Cow-sheds, &c. &c. &c., supplied genuine, in any quantity, from the principal works in the United Kingdom, to suit the buyer's convenience, effected in 12 hours, will be forwarded, postage free, on receiving 1s. by letters prepaid, addressed to J. WOOLHOUSE, 3, Pepper-street, City of Chester.

NOW READY FOR DELIVERY,

JOHNSON AND SHAW'S FARMERS' ALMANAC AND CALENDAR, for 1845, 220 pages, and 100 Engravings of the best Agricultural Implements, with their prices and Makers' names, &c., &c. Price only 1s.; also,

1. JOHNSON'S TRACTS for Agricultural Schools, Cottage Farmers' Assistant, Farmers' Calendar, and Agricultural Chemistry, 1s. each.

2. A New and enlarged edition of JOHNSON ON MANURES, price 16s.

3. VON THAN'S PRINCIPLES OF AGRICULTURE. Translated by C. W. JOHNSON, Esq., F.R.S., and W. SHAW, Esq., in 2 vols., price 25s., cloth.

4. MORTON ON SOILS. A New edition, enlarged, price 10s.

5. SQUAREY'S AGRICULTURAL CHEMISTRY for the Practical Farmer, 5s.

READ the following TESTIMONIAL in favour of PARR'S LIFE PILLS, which is sufficient to convince the most prejudiced person that they are all that is required to conquer disease, and, consequently prolong life:—"To T. Roberts & Co.—Sirs,—I beg to hand, you the following Testimonial, which I have just received from Mr. Williams, Chemist, Nottingham.—Yours, obediently, G. BATTERS, Chapel-street, Nottingham.—Yours, obediently, G. BATTERS, Chapel-bar, Nottingham.

"Sir,—Printing is a great blessing to mankind, for now I am enabled to make known, through you, a perfect cure, by taking PARR'S LIFE PILLS, of extremely bad Indigestion, a Bilious disorder, and Sick Headache, which I have been subjected to for years; and money enough has been paid to physicians and surgeons, which now would have been a little fortune to me. I wish every fellow-creature clearly to understand that I was wonderfully relieved by taking one box of PARR'S LIFE PILLS. Accident threw a testimonial in my way of a miraculous cure of a bilious attack and sick headache. The second box enabled me to go about my business with spirit and alacrity; and by taking two or three more boxes, I am happy to add my humble testimony of a perfect cure of that dreadful disorder—Bilious and Sick Headache, which rendered me, before I took PARR'S LIFE PILLS, unfit for business. Considering the loss of time and pain, persons would find that one box of PARR'S LIFE PILLS is worth, instead of 1s. 1½d., as many guineas. May all persons make trial of PARR'S LIFE PILLS, is the sincere wish of, yours, thankfully,

"To Mr. G. Batters. M. WILLIAMS, Union st., Nottingham"

PARR'S LIFE PILLS are sold by all respectable Medicine Venders. See the words "PARR'S LIFE PILLS," in White Letters on a Red Ground, on the Government Stamp.

Printed by WILLIAM BRADBURY, of No. 6, York-place, Stoke Newington, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, Printers, at their Office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the Office, No 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, November 23, 1844.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS AND DAY, Architects, &c., Gloucester Place, King's Road, Chelsea, HORTICULTURAL BUILDERS, and Hot-water Apparatus Manufacturers, invite the attention of Horticulturists to their Improved Plan of Bottom-Heat, now becoming so universally adopted.

From the extensive Practice they have been honoured with for 20 years in designing and building CONSERVATORIES, GREENHOUSES, HOTHOUSES, PITS, &c. &c., and erecting their HOT-WATER APPARATUS to every description of Buildings to which heat is applicable, J. Weeks and Day have the greatest confidence in recommending their BOILERS as the most efficient of any yet invented, their largest being capable of heating a range of Forcing Houses 300 feet in length, with a comparatively small quantity of fuel, and only requiring attention once in 10 hours. To be seen in use at most of the London Nurseries, also at their Manufactory; and a variety of Horticultural Erections, Models, Plans, &c. &c.

Just published, price One Shilling,

SUGGESTIONS TOWARDS AN INQUIRY into the PRESENT CONDITION of the LABOURING POPULATION of SUFFOLK. By the Rev. J. S. Henslow, M.A., Rector of Hitcham, and Professor of Botany in the University of Cambridge.

"Much food is in the tillage of the poor: but there is that is destroyed for want of judgment."—Prov. xiii. 23.

Also, by the same Author,

LETTERS to the FARMERS of SUFFOLK. Price 2*s*. And SERMONS on IMPROVED ATTENTION to the SACRAMENTS. Price 1*s*.

J. W. Parker, West Strand, London.

In 4to, with large Chart, and Steel-plate, Coloured Maps of England, Wales, and Scotland, price 4*s*.; or without Maps, 3*s*.

Consulting Actuary—W. Ratray, Esq., King William-st., City.

The greatest present benefit, and the greatest future advantages to those who attain the average duration of Life are secured to the Assured in this Office, *a combination of advantages presented by no other in London.*

The principle adopted in the distribution of the profits is *peculiar to this Office*, and is at once safe, equitable, and favourable to young and good lives. The surplus is reserved for Members who survive the period at which their premiums, with accumulated interest at 5 per cent., shall amount to the sums assured, and may be received in cash, or applied in the reduction of the future premiums, or to the increase of the sum assured.

The Premiums are deduced from the Government experience, and are accurately adjusted to the several ages. At early and middle life they are about *one fourth lower than at most other offices.*

All the objects of Life Assurance may be effectually accomplished at this Office.

Every facility and information afforded on application at the Office, 17, New Bridge-street, Blackfriars.

Charles James Thicke, Resident Secretary.

LIFE ASSURANCE AND ENDOWMENT.—The following are specimens of the Premiums charged by the AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY, for the Assurance of a payment of £100 to the Assured on the attainment of the age of 60, or for the payment of that sum to his Representatives, in case of his death before that age:—

Age	20	25	30	35	40	45
Ann. Pr.	1*l* 17 10	2*l* 5 8	2*l* 16 6	3*l* 11 3	4*l* 14 0	6*l* 13 1

Persons assured to the amount of £500 participate in the profits of the Company.—Subscribed Capital £200,000.

For Forms of Proposal, and other particulars, apply at the Offices, 126, Bishopsgate Street, corner of Cornhill, City.

DISEASED AND HEALTHY LIVES ASSURED.
MEDICAL, INVALID AND GENERAL LIFE OFFICE,
25, PALL MALL, LONDON.
SUBSCRIBED CAPITAL £500,000.

THIS Office is provided with very accurately constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. The EXTRA PREMIUM DISCONTINUED on restoration of the Assured to permanent health. Increased Annuities granted on UNSOUND LIVES, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates. Healthy Lives are Assured at LOWER RATES than at most other Offices. POLICIES of twelve months' standing are NOT AFFECTED BY SUICIDE, DUELLING, &c.; and Assigned Polices are valid from the date of the Policy, should death ensue from any of these causes. F. G. P. Neison, Actuary.

GLOBE INSURANCE, Pall Mall and Cornhill, London.

EDWARD GOLDSMID, Esq., Chairman.
WILLIAM TITE, Esq., F.R.S., Deputy-Chairman.
GEORGE CARR GLYN, Esq., Treasurer.

Established 1803, for Fire and Life Insurance, and Annuities, and the purchase of Reversions and Life Contingencies. Capital One Million Sterling; the whole paid up and invested, and entirely independent of the amount of premiums received.

Insurances may be effected on single lives, on joint lives, and on the contingency of one life surviving another. Persons deriving life incomes from Church Preferment, Public Offices, or any other Civil or Military employment, may, by appropriating a part of their income to provide the Annual Payment, alleviate the distress which their death would otherwise occasion to their family or friends.

Rates and Conditions of Fire and Life Insurance, or other information, may be obtained at the Offices in London, and of the Company's Agents in the country.

(By order of the Board) John Charles Denham, Sec.

London, Nov. 1844.

ROWLAND'S UNIQUE PREPARATIONS.—Under the Patronage of the several Sovereigns and Courts of Europe, and universally preferred.

ROWLAND'S MACASSAR OIL,

for the Growth and Preservation of the Human Hair. Price 3*s*. 6*d*., 7*s*., family bottles (equal to four small) 10*s*. 6*d*., and double that size 21*s*. per bottle.

ROWLAND'S KALYDOR,

for Improving and Beautifying the Skin and Complexion. Price 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

ROWLAND'S ODONTO,

or Pearl Dentrifice, for the Teeth and Gums. Price 2*s*. 9*d*. per box, duty included.

Caution.—Spurious Compounds are frequently offered for sale, under the same names (some under the *implied* sanction of Royalty), the Labels, Bills, and Advertisements of the original articles are copied, and either a Fictitious Name, or the word "Genuine," is used in the place of "ROWLAND'S." It is therefore imperative on purchasers to see that the word "ROWLAND'S" is on the Wrapper of each Article, and

A. ROWLAND & SON, 20, Hatton Garden,

engraved on the Government Stamp, which is affixed on the KALYDOR and ODONTO.

Sold by the Proprietors, and by Chemists and Perfumers.

All others are fraudulent counterfeits.

News of the Week.

From France we learn that on Sunday the King signed a Royal ordinance, convoking the Chambers for the 26th Dec., and that the Opposition Papers are already speculating on the plans of the new campaign. The affairs of Morocco and Tahiti are to be the chief points of attack, and the Opposition are said to be preparing a new system of tactics, the effect of which will be a coalition among the different branches of their party. The strength of the Guizot Cabinet in the last Session was derived in a great measure from the division of its enemies; and it is expected that a better understanding among the leaders of the Opposition will scarcely permit the Ministry to survive the debate on the Address. The adjudication of the forthcoming loan divides the attention of the Paris journals with the late proceedings of the Irish Repealers. Mr. O'Connell's announcement that he has abandoned Federalism and again adopted simple Repeal, affords a fertile theme to politicians of all classes; and their criticisms are by no means complimentary to the consistency of his principles. The Ministerial Papers contend that there can be no medium between union and absolute separation, and that Repeal on the plan laid down by Mr. O'Connell in his "five points," is perfectly impracticable. The Opposition Papers, in censuring Mr. O'Connell for shrinking from his position, insist that Repeal would lead to civil war and the di-memberment of the Empire, and for this reason are angry with him for not hastening the crisis. They all, however, agree that Mr. O'Connell's advances to the Protestants of Ireland were altogether hopelese, and that his uncertainty of action has tended to diminish those proofs of adhesion to his cause, which were signified in the expressive form of the Repeal rent.—In Spain another insurrection has broken out under the formidable Zurbano, whose name as a guerilla chief is so familiar to our readers. The rising is at present confined to Old Castile, but Burgos, Santander and St. Sebastian are said to have joined the movement, and by the last accounts it is rapidly extending. Zurbano's force consists mostly of old soldiers who served under him during the worst scenes of the civil wars and know him well. These men are formidable as much by their character and past exploits as by their numbers; and the difficult nature of the country, with every inch of which Zurbano is familiar, may enable him to defy the troops of the Government for months. The particulars of the rebellion are not yet known, but it is said that the watchword of the insurgents is "The Constitution of 1837, and Isabella II." In the meantime, the Ministerial measure for the reform of the Constitution, by expunging the principle of national Sovereignty and augmenting the power of the Crown, is rapidly advancing. Nothing can be more feeble than the opposition offered to the measure, and the only speech which seems to have produced a real impression on the Chamber was one which advocated, not the maintenance of representative Government, but a return to the strict forms of absolute monarchy. The general discussion on the Bill closed on the 12th, and the preamble was voted on the next day in the terms proposed by Ministers. The prosecution of Gen. Prim is said to be a subject of great embarrassment to the Government. The Council of War met again on the 14th, and granted his counsel but an hour and a half to prepare his defence. It was rumoured that fresh charges of a serious nature had been brought against him, and that his acquittal was very doubtful.—From Italy we have further particulars of the disastrous flood which has desolated the fair city of Florence and laid waste the fertile district of the Val d'Arno. The loss of life and property in Tuscany appears to have been immense, and the accounts from Rome state that the inundation has been scarcely less destructive in other parts of Italy.

At home, the affairs of the Church are daily becoming a topic of universal interest. In the diocese of Exeter, a dispute between the curate of Helston and his congregation respecting the introduction of certain forms in the observance of Divine Service, has led to an appeal to the Bishop from a large body of the parishioners, who identified these forms with Puseyite or Tractarian doctrines. The Bishop, in an elaborate judgment, pronounced the innovations, with scarcely an exception, to be in strict accordance with the Rubric, and his Lordship has since taken measures for enforcing their observance in all parts of his diocese. In the see of London also, a similar collision has taken place, the congregation of one of the Tottenham churches having appealed to the Bishop of London against the new forms introduced into Divine Service by the clergy of their church. The Bishop justifies the adoption of the forms on the ground that they are in accordance with the Rubric, but has directed their suspension for one year in the church in question, in order to give the congregation further time to reconsider the propriety of conforming to his views. The same hostility has been shown to these innovations in other places, and it is evident that the laity generally are strongly opposed to any change in the mode of performing the Church Service.

Home News.

Court.—The Queen and Prince Albert, the Prince of Wales, and the Princesses, are at Windsor Castle, and are quite well. The Queen and Prince on Sunday attended Divine Service in the private chapel of the Palace, and during the week have taken their usual walks and rides in the grounds of the Castle. The Prince on Monday and Tuesday shot in the royal preserves. On Wednesday the reigning Duke and Duchess of Saxe-Coburg and Gotha, and H.R.H. the Duke Ernest of Wurtemberg, arrived at the Castle on a visit to Her Majesty. Thursday being the birthday of the Princess Royal, the band of the Horse Guards played a serenade on the Castle Terrace. The Queen and her royal guests afterwards visited the gardens at Frogmore, and took an airing in pony carriages. The Marchioness of Douro has succeeded Lady Portman as Lady in waiting; Lord Rivers has succeeded the Earl of Morton as Lord in waiting; Mr. Ormsby Gore has succeeded Capt. Meynell as Groom in waiting on Her Majesty; and the Hon. Miss Hamilton and the Hon. Miss Stanley have succeeded the Hon. Misses Paget and Liddell as the maids of honour in waiting on the Queen.

Cabinet Council.—A Cabinet Council was held on Monday at the Foreign Office. It sat 2 hours, and was attended by all the Ministers.

Parliamentary Movements.—A rumour has been in circulation for some time that Mr. Scott, M.P. for Walsall, will resign his seat at the meeting of Parliament, owing to indisposition. In such case, it is believed that Mr. Forster will offer himself as a candidate on the Conservative side, and Mr. Littleton, the son of Lord Hatherton, on that of the Opposition.

Foreign.

France.—The Opposition Papers announce that, on Sunday the King signed an ordonnance convoking the Chambers for the 26th December. The *Moniteur* and Ministerial prints are silent on the subject; but in the columns of their opponents there are several articles which are usually put forth on the approach of the session. Intrigues are diligently imputed by them to the Cabinet; it is predicted that the Morocco and Tahiti affairs will scarcely permit the Ministry to survive the debate on the Address; and the electoral colleges are exhorted to prepare for a dissolution, which M. Guizot and his colleagues may very possibly resort to in the condition to which their foreign policy has reduced them. The *Revue des Deux Mondes* states that the Opposition are to take a very moderate tone in the next session of the Chambers, and to declare themselves much friends to a real *entente cordiale* with England as M. Guizot himself. This new system of tactics, it is thought, will have the effect of combining the different branches of the Opposition, and of making it act more in unison than it did last session. There is no doubt that during the last session the great strength of the Guizot Cabinet lay in the division and violence of its enemies. The new plan has already caused considerable alarm to the friends of the Cabinet, notwithstanding the recent triumph of M. Guizot and the apparent tranquillity of the political world.—By the same private letters which the Government have deemed it proper to adopt towards the ever turbulent Ecole Polytechnique, are discussed with considerable vivacity. In consequence of the expulsion of 17 of the pupils, some 60 or 80 assembled on Monday, when, after much hesitation,

they determined on drawing up an address to the King, which four of them proceeded with to St. Cloud. In this memorial they represent the delicate situation in which they are placed between the fear of being considered rebellious and the engagement they entered into, when they made their last demonstration against their superiors, not to let any of their comrades suffer the consequences of a line of conduct which was common to them all. This appeal was received by an Aide-de-Camp to the King, who promised to lay it forthwith before His Majesty.—The naval Court-Martial for the trial of Lieut. Besson, of the Groenland steam frigate, for the loss of that ship on the coast of Morocco commenced its proceedings at Toulon on the 14th. Several witnesses deposed to the good conduct of Lieut. Besson, and his defence appeared, from his replies to the questions of the President, to rest principally on the thickness of the fog in which his vessel was enveloped at the time of the accident, and his ignorance of any currents on the part of the coast where she was lost. The sitting was adjourned to the following day, when Lieut. Besson was acquitted by the chairman's casting vote.—The attention of the Paris Papers and the public is in a great measure directed towards the Bourse and the forthcoming loan, the approaching adjudication of which, so far from depressing the stock in which it is to be made, had caused on Saturday, "to the astonishment of the oldest speculators," we are told, a further and considerable rise in price. It was understood that the house of Hottingeur, of Paris, would compete for the loan with the house of Rothschild, which had been joined by not only all the other respectable Paris bankers, but by the receivers-general.—The affairs of Ireland supply another topic of interest to the French Journals, and the Repeal agitation is discussed alike by the Ministerial and Opposition Papers in a tone not very complimentary to Mr. O'Connell. They unanimously contend that "Simple Repeal" is simple rebellion, and censure Mr. O'Connell for shrinking from his position. The Government Papers argue that "there can no medium between a union and an absolute separation," while the Opposition Journals believe that "civil war and revolution must be the certain results" of Repeal, and are therefore anxious to precipitate it. The Ministerial *Débats* says "Mr. O'Connell has come forward to explain what he means by Repeal;" and the passage from the late anti-Federalist letter from Derrynane is then quoted:—1st, The maintenance of the connection between Great Britain and Ireland by means of one executive power, and the golden band of the Crown. 2dly, The Repeal of the Act of Union. 3dly, The re-establishment of the House of Lords in Ireland. 4thly, The re-establishment of the Irish House of Commons. 5thly, The complete legislative and judicial authority of one Irish Parliament in Ireland. Now let us declare," continues the *Débats*, after having summed up "these five points of Repeal, let us declare, in all sincerity, that the greatest enemy of Ireland could not wish her a severer scourge than such a constitution. We have repeatedly said that some people in Ireland argue as if the inhabitants were all one race, as if it were a single nation. This is a radical error. Let Ireland be separated from England, and what will she become? A country cut in two, divided into two distinct populations essentially hostile to each other, enemies in blood and in religion. Thus the Repeal party demands an Irish House of Lords. This Upper House must necessarily be composed of Protestants and Orangemen. The House of Commons, as representative of the democracy, must, on its side, be Catholic and national. A conflict must immediately ensue between the two branches of the Legislature. Who is to arbitrate between them? The executive power. But this is England. Will it be said that it is the Crown? But what is the Crown in a constitutional kingdom? Here the ministers are responsible; and to whom are they responsible? To the English Parliament. This would be entering into a vicious circle. There can be no medium between union and absolute separation." The *Débats* then proceeds to point out the impracticability, as well as insanity, of Repeal, and concludes that the insincerity of Mr. O'Connell is of itself a sufficient guarantee that the revolutionary conflict which alone could ensue from the taking of any active steps towards reducing "simple Repeal" into practice, will never be permitted to arise. The republican *National*, which is anxious for the dismemberment of the empire, and angry with Mr. O'Connell for vacillating, argues the question as follows:—"O'Connell has decided on again rousing himself from his repose, and has announced to the Repeal Association that he will again appear amongst them on the 25th. The experiment which he has tried has not succeeded. He expected to bring over by degrees, a portion of the Protestants of Ireland. He has solicited them to bring forward their plan of Federalism, to organise a movement, and to call on England. These advances have been replied to by abortive publications, and the English Whigs have shown as much repugnance for a federal Parliament as for one perfectly independent of England. O'Connell in his letter complains with great bitterness of this conduct; but can we believe in the sincerity of his complaints? He who knew his country and the Saxon so well, could he really have flattered himself to reconcile such conflicting interests, and to get those who have been engaged in such desperate struggles to become thus united? What can be the utility of those constant deceptions? They have only produced one effect—that of entirely suspending the proofs of adhesion to the Repeal Association, which were signified in the expressive form of pounds, shillings, and pence. Has Ireland obtained in real ameliorations what O'Connell has gained in influence, in wealth, and in glory? The new propositions which Mr. O'Connell has to make to the Association will not advance it a single step." M. Gustave de Beaumont, and M. Duvergier d'Hauranne, two well-known writers, have also taken up the question,—M. d'Hauranne in the *Constitutionnel*, and M. de Beaumont in the preface to a new edition of his work on Ireland, in which he expresses much confidence in the sound judgment of Mr. O'Connell, but despairs of the concession of Repeal until England shall be in circumstances of great difficulty and danger.—Baron de Bourqueney, from Constantinople, M. de Lavallette, from Alexandria, and M. de Nyon, from Tangiers, arrived in Paris on Friday.—Rear-Admiral Hernoux, who has recently been promoted for the part which he took in the affairs of Tangier and Mogador, has been elected Deputy for Nantes.—Letters from Toulon of the 13th, state that the Duc d'Aumale and the Prince de Joinville were to embark on the 18th for Naples, in the Gomer steam-frigate, accompanied by a squadron of steamers.—The first trial, on a large scale, was made of M. Hallete's plan of applying the atmospheric system to railroads, a few days since, on a space of 300 feet, in his manufactory at Arras. The result appears to have been so satisfactory, that Messrs. Arago, Seguier, and other distinguished engineers, are to be invited to witness a second trial in a few days.—A company of capitalists have offered the Government to construct, at their own expense, a definitive hall for the Grand Opera in the Champs Elysées, on condition that the present theatre should be given to them as an indemnity. They intend to demolish the latter, and to build on its site eight or ten hotels, which will be worth 20,000,000*f*.—Letters have been received from Rio of the 19th ult., announcing that at that date the frigate Virginie, commanded by Admiral Hamelin, had arrived at that port, and would shortly proceed on her voyage to Tahiti.—The *Débats* states that Mr. Alderman Moon, who moved the address of the city of London to the King of the French at the period of His Majesty's visit to Windsor, had the honour to dine with their Majesties at St. Cloud on Wednesday week. On Saturday afternoon Alderman Moon had again the honour to be received by the Royal family, and to pass the evening at the château of St. Cloud.

SPAIN.—A telegraphic despatch announces that Gen. Zurbano, the famous leader of guerillas, has raised the standard of rebellion against the Government, in Old Castile, and that Burgos, Santander, and St. Sebastian have joined the movement. Their banner is inscribed with the words, Viva the Constitution of 1837; Viva Isabella II.—Our accounts from Madrid state that the Chamber of Deputies adopted on the 8th the address in reply to the speech from the throne, and the discussion on the projected reforms in the constitution commenced on the 9th. No incident of particular importance occurred in the course of the debate until the sitting of the 11th, when M. Tejada delivered a speech which caused a great sensation among all parties, because the opinions of the speaker were supposed to have revealed the ultimate objects of the Court and of the Cabinet itself. M. Tejada began by declaring that the proposed reforms would have the effect of seating the Government on a solid and durable basis. He next proceeded to state "his personal opinion on the question, which was entirely opposed to the existing order of things." He defended the principle of the old public law of Spain, in virtue of which the King was the sole chief of society and the Government; and contended that the Constitution, whether reformed or not, was doomed to perish, and that the people, tired of revolutions and undeceived respecting the blessings which were to result from them, would sooner or later declare against a representative government, and substitute in its place a monarchy tempered by the intervention of the wealthiest and most honourable citizens. He concluded by a review of the situation of the Church, advocated the necessity of a *concordat* with the Pope, and the restitution of the national property to the clergy; and recommended that the consideration of the question of the marriage of the Queen should be postponed to a more favourable moment than the present one. This speech was frequently interrupted by the murmurs of the Assembly. The President even felt obliged to call the speaker to order. M. Martinez de la Rosa, Minister for Foreign Affairs, having risen to reply, repelled the accusations directed against the framers of the *Estatuto Real*, who, he maintained, had rendered a great service by decreeing the exclusion of Don Carlos and his descendants from the throne of Spain. He then defended the legality of the proposed reform, and strongly insisted on the propriety of expunging the principle of national sovereignty from the preamble of the Constitution, which, he said, was an insult to the throne and the consecration of the revolution of La Granja. M. Martinez de la Rosa was obliged, however, by the lateness of the hour, to vacate the tribunal, but on the following day he resumed his speech, which is considered in the light of a manifesto of the Government. After repelling at some length the charge of contemplated reaction, directed against him and his colleagues, he proceeded to refute the Absolutist doctrines contended for on the preceding day by M. Tejada, whose speech, he said, might have answered in the time of Charles III., but in our days, after the events and revolutions the country had undergone, the Constitutional Government was the only form to which it would submit. He maintained, notwithstanding M. Tejada's assertions to the contrary, that Spain was fully ripe for a Representative Government, and that it was the Administration that wanted force to uphold it. Those who advocated the Absolutist system were not, he said, the real defenders of the throne, for on several occasions, when the monarchy was in danger, he saw the Royalists, who had compromised it, abandon it to its fate. He cited the dreadful night of the 7th July, in which the Sovereign was left entirely isolated, and when the only men who rallied round him were the partisans of constitutional doctrines. When that Monarch died, those who prided themselves on being Royalists *par excellence* were merely striving to snatch the sceptre from the hands of his daughter, to place it in those of an usurper. "An abyss," exclaimed the Minister, "separates those men from us." He had seen the *beau idéal* of absolute government in happy and peaceable Tuscany, but, being a native and resident of Spain, he abhorred that system. There was in Spain but one legitimate representative of absolute government—he who disputed the throne with our Queen. M. Tejada, unwillingly no doubt, had placed himself on a slippery declivity, on which is to be found despotism, and at the bottom Don Carlos. M. Martinez de la Rosa next proceeded to discuss the ecclesiastical question, and declared amongst other things, that the purchasers of national property might rest tranquil, for their rights would be respected. As respected the marriage of the Queen, when the discussion of the paragraph relative to it should come on, the Cabinet would express its opinions on the subject, but in the meanwhile he would assure the house, that the Government had no secret view in proposing that paragraph, nor was it bound by any secret engagement respecting it. Ministers would confine themselves to advise Her Majesty to adopt the course most conducive to the interests of the nation. Finally, it was the wish of the Government to reform the Constitution of 1837 in such a manner that all those who desired the throne of Isabella II., and the institutions, should rally round that Constitution. M. Tejada next rose and explained his principles. He was anxious to see an alliance between the rights of the people and those of the throne, and expressed his aversion for despotism and Don Carlos, having always supported the legitimacy and rights of Isabella II. After he had concluded, several deputies having demanded that the general discussion be closed, M. Equizabal moved a resolution that it should continue until every member inscribed should have delivered his opinion. The Chamber, nevertheless, declared that debate closed, and that on the paragraphs commenced. On the 13th the preamble of the bill was voted, in the terms proposed by Government, and approved by the committee. The Senate also met on the 13th, but their proceedings were quite destitute of interest.—A long conference, which had just taken place between the Minister of Foreign Affairs and the French Ambassador, was much talked of. It was said that favourable accounts from Rome had been communicated to M. Bresson, and that the Pope had even consented to ratify the sales of national property. The Minister of Finance was only awaiting the estimates of the expenses of the Ministry of War to lay before the Cortes the general budget, in which, for the first time, the receipts and expenditure will be equally balanced. The Ministers of Finance and Justice were engaged in drawing up the project of law relative to the maintenance of the clergy. They had already had several interviews with a number of bishops, at which the basis of a law calculated to conciliate all interests was agreed upon. The Ministerial Papers state, nevertheless, that the Government will insist on the suspension of the clerical property, and that the measure will be made a Cabinet question.—The Swedish and Danish Envoys had waited on the Duc de Glucksberg on his return to Madrid, and had been informed by him that the differences which had arisen between their Governments and Morocco were in progress of adjustment.—The *Tiempo* publishes a letter from London, stating that Lord Aberdeen had directed Mr. Bulwer to express his deep regret to the Spanish Government for the sinking of the Spanish ship of war Rayo, whilst he added that the commander of that ship had violated the right of sovereignty exercised by England in the waters of Gibraltar.—The prosecution of General Prim, respecting which great secrecy continued to be observed, was believed to be a subject of extreme perplexity to the Government. It was reported that Commander Alberni, who, after being implicated in the conspiracy, had turned Queen's evidence, had been arrested.—A letter from the frontiers of Arragon states that for the last 40 years so severe a winter as the present had not been experienced in those mountains. Neither has there ever been seen so many wolves as during the past month. They proceed in packs and commit great destruction.

PORTUGAL.—We have accounts from Lisbon to the 14th inst. On the 9th the Ministers had a majority in the Chamber of Peers of 37 votes against 12 on the question "of the use made of the extraordinary powers conferred on Government for the suppression of the revolt." Donna Maria having reached the sixth month of her pregnancy, prayers *pro felici partu* have been directed to be offered up in all the churches of the kingdom. Robbers still infest the suburbs of Oporto, and the papers record no fewer than five serious burglaries within ten days. Business was never more dull both there and in Lisbon, and the most prejudiced are at last beginning to confess that a tariff convention with England is indispensable. Ports have fallen to a price never before witnessed in the history of this wine, the bulk of the demand being now, according to the circular of Messrs. Clark and Son, for wines, between 15*l*. and 22*l*. per pipe. Senhor Gaviao stated, without contradiction, in the Chamber, that the common price of wine in many of the country districts is 6*s*. per pipe!—Jose Bento de Aranjo, one of the richest and most respectable

merchants and capitalists in Lisbon, died on the 9th inst. in his 87th year. He was one of the three original founders of the Bank of Lisbon, and amongst the first deputies sent to the Cortes. It was his boast, that he came to Lisbon from the provinces with only a *crusado* (2*s.* 3*d.*) in his pocket.

Holland and Belgium.—The Dutch Chambers have at last come to a vote on the address in answer to the King's speech, the delay having arisen from the refusal of the First Chamber to agree to the address. The affair was compromised by the adoption of two paragraphs, stating that "the Second Chamber expressed a wish that during this period the revisal and improvement of our constitutional institutions may be taken up at a seasonable opportunity. The First Chamber, on the contrary, without entering on the examination of the question whether it is desirable to proceed to such revisal and improvement, found in the fundamental law an obstacle which hinders it from agreeing to the expression of the wish of the Second Chamber."—In the night of the 11th there was a dreadful hurricane, with torrents of rain, on the coasts of Flanders. The west and north winds caused high tides, with a very hollow sea. The rain and wind hindered for three days the departure and the arrival of the English mail packets, and occasioned some damage in the environs of the capital. The quantity of rain, which has fallen uninterruptedly, gives reason to fear that the rivers will again overflow their banks. The Senne is already very high, and several meadows are inundated.—The Belgians, in their impatience for the acquisition of a territorial footing in the New World, seem to have made a signal mistake in the selection of St. Thomas, in Central America, and the papers describe the last accounts from the colony as most disastrous.

Germany.—Letters from Berlin state that the late exhibition of the production of German Art and Manufactures has given occasion to the formation of a Society the object of which is to ameliorate the condition of the mechanic and workman in the manufactories, not only by relieving their distress, but by establishing savings banks and schools, and distributing useful writings. The King has written a letter to the Minister of Finance, expressing his satisfaction at the institution of this Society, and has given a sum of 15,000 dollars to promote its object. His Majesty promises further assistance in proportion to the increased exertions of the Society.—A letter from Bromberg, in Prussia, states that a congregation of Catholics in that place has separated from the mother church. It refuses to acknowledge the authority of the Pope as head of the church, or to continue auricular confession, but it preserves the celebration of the Mass.—The Papers state that 48 lines of railroad have been proposed in Prussia, extending over a space of 641 German miles, since the 1st of this month. The capital expended on the lines already opened is 35,551 143 crowns. The roads in construction require a capital of 56,619,500 crowns. The roads projected will require a capital of 68,000,000 crowns.—Intelligence reached Berlin on the 8th inst. that the Empress of Russia was seriously indisposed, from an attack of spitting of blood. The King of Prussia was about to repair to St. Petersburg to visit his sister.—It is stated, that of 80,000 children who inhabit the city of Berlin, 40,000 only attend the schools, the remaining 40,000 are employed in manufactures. It is also said that a hairdresser at Ulm has invented a machine with which he pretends to be able to fly from Ulm to Paris in three days.—A letter from Frankfort mentions that business has been extremely dull ever since the illness of Madame Meyer Amschel Rothschild, who is now 99 years of age. The eldest of her sons had made a vow to give the poor a sum of 40,000 florins if his mother accomplished her 100th year.—The *Prussian State Gazette* contains the following, under date Vienna, 3d inst.:—"The changes introduced into the tariff last July have exercised such a beneficial influence over the receipts of our Customs and our manufacturing interests, that the Government is thinking of applying the same system of reduction to several articles of manufacture, either by reducing the import duty or by converting the prohibition into a moderate protecting duty. The duties on fine and mixed cotton goods, printed and others, will be modified, but those on woollen cloths will continue the same."—A letter from Vienna, of the 4th inst., states that Prince Altieri, the Pope's Nuncio, had protested against the imperial resolution adopted relative to mixed marriages, which relieves the non-Catholic husband or wife from an obligation to promise to educate their children in the Catholic religion. This protest has been rejected by the Emperor, inasmuch as His Imperial Majesty, according to the terms of a bull of Pope Sylvester II., granted to King Stephen, enjoys unlimited jurisdiction in religious matters. This resolution has produced a favourable impression at Presburg.—The *Cologne Gazette* states that the late riots in Bohemia had not a political cause, but that they originated in the excessive taxation imposed upon the people, as well as the seignorial privileges and other abuses. Prince Metternich is said to wish to maintain the *status quo*, but the Baron de Kubeck and the Grand Duke Stephen desire that all abuses should be removed as speedily as possible.

Italy.—The following account of the flood at Florence, whose disastrous ravages we noticed in our last, is given by an eye-witness:—"The rain began on the 3d, and continued nearly the whole day; during the night it increased, and fell in one continued torrent. Early on Sunday morning the alarm was given that the Arno was inundating the town; and in about half an hour all the lower parts of Florence were 6 and 7 feet deep in water; so sudden was the rush of water, that there was barely time to take the horses out of the stables, and several were drowned. Those persons who were in the streets rushed into the houses; and many who were in the churches were obliged to stay there till the following morning. In Santa Croce there were 2 feet of water, and the Piazza was inundated to the depth of 10 feet. All this happened between 7 and 8 o'clock. Many persons who slept on the ground floors were awoke by the water forcing open the windows or doors. All this while the Arno kept rising; windows, chairs, tables, pictures, in short, every article of furniture came whirling past in the torrent. At 10 o'clock a tremendous crash was heard; the upper wire bridge had given way, and the whole wood-work of it came dashing past the Ponte Vecchio, where the jewellers have their shops; it was expected every moment to be carried away, but luckily it resisted the shock. The consternation was at its height, for here was a mother inquiring for her child, or a father asking for his son. The rain still falling in torrents—no boats to be had—all carried away. At last two were procured, and rafts were made to succour those parts of the town that were inundated. Seven persons were drowned in the streets. At 2 P.M. the Arno began to subside, still no one could get to the inundated quarter; more than two-thirds of the town were without bread, and no help reached them till evening. It was dreadful to hear the cries of 'Bread, bread,' from the streets that were inundated. At last the rafts were able to take bread, and in many streets remote from the centre they were from Saturday evening till Sunday night without food. All the cellars are full of water; all the merchandise in the custom-house ruined; shops have been completely cleared; a picture-dealer found but a mass of sand in his shop, all else swept away. At the Cascine, the hares, &c. have been drowned, and the walks ruined. In the country it is much worse—whole towns are under water, and without food. It rains incessantly, and another flood is expected every day. No English have perished. The streets are still full of water. The damage at the Custom-house alone is estimated at 2,600,000 lire" (above 100,000*l.*) Various other parts of Italy would appear to have suffered from the swelling of her streams. A letter of the 4th, from Rome, states that the continual rains have caused the Tiber to overflow and submerge the lower quarters of the city and the plains. In some of the streets boats were plying, and for several days no mails had arrived from the north, so that it was feared that the Po had also overflowed its banks. The provinces of Casentino and Arezzo have greatly suffered. The roads to Forli and to Faenza are under water, and the little town called Borgo San Lorenzo is also submerged.—The King of Sardinia has issued an ordonnance, in virtue of which the property belonging formerly to the Knights of Malta is to be incorporated with that of the State, the Government paying to the community an annual rent-charge of 42,000*f.*, which is to serve for the establishment of five new commanderies, two of which will have an income of 3000*f.*, and three of 2000*f.* a-year each. The *Augsburg Gazette* of the 13th inst. states, that the King of Sardinia, having read the pamphlet published by Prince de Joinville on the advantage of a steam navy, has determined to construct a steam flotilla as a trial. His Majesty left Turin for Genoa on the 9th inst., accompanied by the Duke of Genoa and Prince Eugene of Savoy, for the purpose of carrying his design into execution.—The same journal states, that the commercial negotiations commenced between the King of the Two Sicilies and the Governments of France and England make no progress, and that His Majesty is more favourable to an arrangement with the Zollverein. A Vienna letter of the 9th says, that the Princess of Salerno, who is about to marry the Duc d'Aumale, will receive a considerable fortune from her aunt, the Queen Dowager of Sardinia, who is stated to have declared her her heiress.

Greece.—Letters from Athens of the 31st ult. state that people were beginning to be discontented with the Chambers, which were still engaged in verifying the powers of their members, and had not yet passed a single law. Acarnania and Etolia were overrun with banditti, and some nights before a party of Palichars had attacked the village of Amourisi, near Athens, killed several persons, and plundered a number of houses.—The election of General Grivas has been confirmed.—The King and Queen, who had returned to Athens after a trip through a considerable portion of the kingdom, were about to take another trip to the Morea.—A new postal arrangement has been entered into between France and Greece, by which the postage in both countries is greatly reduced.—General Kalergi had returned to Athens with his family. The *Greek Observer* says that the number of distinguished visitors of all classes who hastened to congratulate the General on his return, was a splendid testimony of the gratitude of the people for the services which he has rendered to the country.—The daughter of the renowned Marco Bozzaris, Maid of Honour to the Queen of Greece, was married on the 25th ult., at Athens, to M. Karadscha, Chief of the Military School in that city. The King and Queen granted one of the saloons of the Royal Palace for the celebration of the ceremony, and invited a large circle to be present at the festivities.

Turkey and Syria.—We learn by the Levant mail that the state of Syria was hourly becoming more deplorable. A proclamation had been issued at Constantinople, forbidding any person whatever to appear in the streets of Pera and of the villages along the Bosphorus after sunset, and had occasioned some disorders. The Porte, however, on the remonstrance of Sir Stratford Canning, had countermanded the order, and promised to offer an adequate reparation to the British subjects who had suffered from the ignorance of the officers charged with the police. The attempt at insurrection made at Schabatz, in Servia, had been promptly repressed. Wucsitch had been appointed vaivode, or generalissimo of the Servian troops, and Petronievitch Minister for Foreign Affairs. Prince Milosch has left Servia for Italy, where he will make a long stay, his journey being induced by political motives. The Cabinet of Vienna is said to have called upon the Prince to clear himself from suspicion of having been engaged in the late agitation of Servia, and, it is added, the Prince has returned an assurance that he has been a total stranger to those attempts at insurrection. Letters from Albania state that the greatest disorder continues to afflict that unhappy province. A new insurrection had broken out in the district of Debreh, and the lives and properties of the unfortunate Christians fell a daily sacrifice to the cruelty and rapacity of the insurgents. The indemnity which the Porte had solemnly promised to make to the sufferers in the rebellion of last year has proved to be a mere delusion, and not even the 10 per cent. on the losses sustained, to which it was subsequently reduced, has in any instance been liquidated.—From Alexandria we learn that Mehemet Ali was determined to monopolise the transit between that city and Suez, and with that view he had refused to allow the steamer Delta, which had just arrived from England, to navigate the Nile, and had given notice to the Peninsular and Oriental Company that the two steamers now plying on the river must be forthwith withdrawn.

Sweden.—Letters from Stockholm state that in a full assembly of the Noble State, on the 26th October, the fifth chapter of the budget relating to the navy came under discussion. Count Bjœrnstjerna, the Swedish Minister to the Court of London, stated that the English Admiralty had declared itself perfectly satisfied with the Swedish naval officers, who, to the number of about 30, had taken service on board English ships of war. The Count added, that the English Government had recently determined that no foreigners, Swedes excepted, should be permitted to serve as officers in the English navy.

Malta.—The new church of St. Paul, founded by the Queen Dowager, was consecrated on the 1st inst. by the Bishop of Gibraltar in the presence of the naval and military authorities. The prayers were read by Archdeacon Le Mesurier, and the communion service by the Bishop. The *Te Deum*, the chants, psalms, and anthem, were given with great effect by the ladies, who voluntarily assisted in the services, the choir being led by Mrs. W. Frere. The sermon was preached by the Bishop from Ephes. ii.—"Now therefore ye are no more strangers and foreigners," &c. His Lordship, after having entered into the discussion of the subjects of the text, proceeded to show their bearing upon the circumstances of the day. He alluded to the benefits conferred on Malta by this pious act of the Queen Dowager, and observed that he had not thought it necessary to notice the unjust attacks which had been made by persons of extreme views during the progress of the works, hoping that they were now at an end. At the close of the service, the sum of 115*l.* was collected. After the service, a royal salute was fired from the batteries and from the flag-ship, in honour of the Queen Dowager and of the day. On the Sunday following, the Bishop preached in the morning, and the holy communion was administered to about 120. In the afternoon he administered the sacrament of baptism, the infant daughter of the architect being the first person baptised. The child was named Adelaide, after the royal foundress of the church, and was baptised in water brought from the Jordan. The sermon in the afternoon was preached by the Archdeacon, and that in the evening by the Rev. Sir Cecil Bisshopp, Bart.—The Governor, Sir H. Bouverie, has dismissed the Rector of the University from the direction of the primary schools, on the ground that, being ignorant of the language, he is unable to act efficiently; and has also dismissed the Professor of Political Economy, because the appointment, with a salary of 100*l.* a-year, was a perfect sinecure. Another Professor of Greek, Latin, and Italian, has been also obliged to resign or have his conduct made the subject of inquiry in connection with certain charges of plagiarism of the most dangerous class—publishing whole poems in Latin as his own, the works of another, substituting only the name of Bouverie for Leopold, and adopting names of places in Malta for those used in the poem for Italy.

West Indies and South America.—We have later advices from these parts by the Clyde steamer, which left Jamaica on the 25th ult. It appears that the season throughout the West Indies has been unusually hot, causing great sickness and mortality. Demerara was particularly unhealthy, typhus and scarlet fever raging, in addition to the indigenous fever of the colony. The Jamaica House of Assembly was opened by the Earl of Elgin on the 15th October. The Hill Coolie proposition was brought forward in a very full house; and, after a lengthened discussion, was carried: the number, however, being limited to 2000, instead of 5000, as proposed by the Home Government. A dreadful fire occurred on the Canal Coffee Plantations, near Demerara, on the 14th ult., and was burning on the 20th, whereby nearly the whole of that valuable district would be destroyed. The plantations were fired by the peasantry, in consequence of a tax on the sale of plantains having been recently exacted by the collector of the district. From Havannah, we have the gratifying intelligence that the Capt.-Gen. has issued a proclamation, notifying that, on and after 1st Jan. next, all vessels, under

whatever flag, arriving at any of the ports of Cuba with slaves, will be confiscated.—The Penguin packet brings papers to the 28th September, from the Brazils. Commercially the advices are without interest, but politically it would seem that affairs were not going on smoothly in all parts of the empire. The southern provinces were still far from tranquillised or orderly, although held in check, and therefore prevented from any marked overt demonstrations by the presence of military force. The date from Buenos Ayres is the 31st August. The Argentine Minister, General Guido, had informed the Brazilian Government that Buenos-Ayres would consider the departure of General Paz through their territories as an act of hostility, and accordingly Paz had been detained at Rio. This had caused a great sensation at Monte Video, and the circumstance was considered as most unfavourable. A protest against arbitrary and injurious impositions by the Monte Videan Government had been signed by the various British residents and mercantile firms in that city.

TAHITI.—Later accounts have been received from the Society Islands by way of the United States, from which it appears that there has been another battle between the French and the natives, in which great numbers of the latter have been destroyed by their assailants. The Fisgard English frigate has conveyed Queen Pomaré to the Island of Bolabola.

CITY.

Money Market, Friday. — Consols for money and the account closed at 100 ¾; Red. Three per Cents. 99¾; Three and a Quarter, 102 ¼; Long Annuities, 12 1-16; India Stock, 286 to 288; Bank Stock, 206; Exchequer Bills, 64 to 66 pm.; India Bonds, 81 to 83 prem.

GAZETTE OF THE WEEK—BANKRUPTS.—J. SEGMAN, Queen-street, Cheapside, London, colour merchant—J. LAWRENCE, Northampton, tobacconist—C. S. HARRIS, George-street, Hanover square, dressmaker—C. CASH, Whitechapel-road, ironmonger—T. COOPER, Aldgate High-street, coffeehouse keeper—S. HARVEY, East Mersea, Essex, cattle dealer—S. T. WATSON and W. BYERS, Skinner street, City, woollen warehousemen—J. CRAVEN, J. HARDMAN, and G. CRAVEN, jun., Wakefield, dyers—J. CRAVEN, and J. HARDMAN, Thornes, Wakefield, Yorkshire, dyers—J. BROADBENT, Kexby, Lincolnshire, wheelwright and carpenter—B. OSBORNE, Sheffield, Yorkshire, table knife manufacturer—R. ROCHESTER, Hartlepool, Durham, butcher—S. B. PALMER, Bath, watchmaker—C. BONES, Bath, shoemaker—T. MANN, Leicester, paperhanger—J. SHARPLES, Blackburn, Lancashire, cotton manufacturer—J. SUTTON, Leeds, machine maker—T. S. SHERWOOD, Tilehurst, Berkshire, brick maker—J. BURGESS, Chatfield, Suffolk, farmer—J. E. VARDY, Portsmouth, draper—J. H. URRING, Newman-street, Oxford-street, upholsterer—W. JACKSON, Charlotte-street, Fitzroy-square, paperhanger—F. BLUNDELL, New Sarum, Wiltshire, grocer—J. STAPLES, Cottenham, Cambridgeshire, plumber—S. ECCLES and C. RIDING, Manchester, cotton manufacturers—W. NEWTON, Bath, coal merchant—M. TOMKINSON, Kidderminster, linendraper.

BANKRUPTCY ANNULLED.—J. HALL and S. VINCENT, St. Mary Axe, London, wholesale tea and coffee dealers.

SCOTCH SEQUESTRATIONS.—J. SHAW, Cupar, Fifeshire, writer—A. HORN, Auchtermuchty, manufacturer—J. MILLAR, Stonehouse, Lanarkshire, weaving agent.

Metropolis and its Vicinity.

The New Lord Mayor.—At the annual dinner of the Innholders' Company on Friday evening, at their hall in Dowgate-hill, the Chairman gave as a toast, "The health of the present Lord Mayor;" the proposition was met with one of the loudest bursts of indignation ever heard within the walls of that building. Several members of the Livery of this Company addressed the Chairman in opposition to this toast, and expressed the feeling of disapprobation which they declared to be general amongst the Livery at the conduct of the Court of Aldermen, who were really the instruments in the election of the Lord Mayor. It was emphatically denied that the Livery had anything to do with the election of Alderman Gibbs, but asserted that it was a gang of hired persons packed into Guildhall that had carried the show of hands in favour of Messrs. Gibbs and Wood. Had a poll been demanded, the result would have been against both parties in point of numbers. The Chairman declared that the toast he proposed was complimentary to the office of Lord Mayor, and not to the man who filled it; but the opposition was persisted in after this announcement still more furiously than before, and ultimately the Chairman was compelled to withdraw the toast, amidst the cheers of nearly the whole assembly. At the annual dinner of the Tallow Chandlers' Company, at which about 200 were present, the Master gave the old routine toast of 200 or 300 years' standing, "The Right Hon. the Lord Mayor and the Corporation of the City of London," when a burst of indignation burst forth from the Livery assembled; the Master rose and said he had merely done his duty in complying with his instructions, and with a very ancient usage, and it was not for him to alter such usage, but if the following toast would be more in unison with the sentiments of the Livery, he would propose "The Aldermen and Corporation of the City of London." This was received with general applause, and restored the harmony of the meeting. There were present at the dinner Aldermen Johnson, Farncombe, and Humphrey, M.P., and Mr. Benj. Hawes, M.P. for Lambeth. At the annual dinner of the Loriners' Company a similar scene occurred. After the usual loyal toasts the Master proposed "The Magistracy of the City of London." The moment he uttered it a scene of the greatest uproar and confusion ensued; and not a single person would raise a cheer. This confusion lasted some time, and was only put a stop to by the Master proposing "The Health of the late Lord Mayor and the Magistracy of London." The same occurrence took place at the dinner of the Stationers' Company, of which the late Lord Mayor is a member, and at those of other companies scarcely inferior in wealth or influence. On Tuesday a Court of Aldermen was held, and being the first in the present mayoralty, the Lord Mayor, as is customary, went in state. On the State carriage drawing up in front of the Mansion-house, a vast concourse of persons assembled. As soon as the Lord Mayor presented himself, he was assailed by a shower of hisses, but this was nothing compared to the reception which he met on his arrival at Guildhall. At this place there were nearly a thousand persons of all ranks and grades assembled, and the instant the Lord Mayor descended from the State carriage to enter the hall, one loud burst of yells and hisses broke forth, which continued in spite of the police, and was to be heard even after the Lord Mayor had entered the hall. The same scene was enacted upon the return of the Lord Mayor to the Mansion-house. As a contrast to these proceedings, the Board of Guardians of the City of London Union, of which the Lord Mayor is chairman, have presented him with an address of congratulation on his accession to the Chief Magistracy. In this document they state that they "have reason to acknowledge with pride and satisfaction the indefatigable zeal and ability evinced by your Lordship as their chairman, during a period of nearly eight years; and the experience they have thus gained of your Lordship's character and talents gives them the highest confidence that the same ability and proficiency will be exercised for the benefit of their fellow-citizens at large, in the wider sphere of usefulness which your Lordship is now called upon to occupy."

Court of Aldermen.—A Court was held on Tuesday, at which it was unanimously resolved to present the thanks of the Court to the late Lord Mayor, for the faithful and honourable manner in which he had discharged the duties of his office.—The Inquest of the ward of Farringdon Within appeared at the bar, with a presentment of 146 wholesale dealers carrying on business in the ward without being free, and the Court, after some discussion, resolved to take immediate proceedings against the parties.

The Gresham Club-house.—A neat and extensive stone building, recently erected at the corner of St. Swithin's-lane and King William-street, City, known as the Gresham Club-house, was opened on Tuesday evening for the accommodation of members for the first time.

Bank of England.—The Bank Directors have come to a resolution to charge a commission on the sums remitted to various parts of the country by means of the branch banks. This measure came into operation on Monday, and the system of charge adopted is based on the principle that parties keeping an account with the Bank, or its branches, should have a preference over strangers. First, with respect to remittances. All sums advised for the credit of a person having a drawing account at the Bank, or a branch, are to be subject to a charge of 6*d.* per cent., the minimum charge to be 1*s.*, and every fraction of 100*l.* to be considered as an entire 100*l.* Thus 200*l.* will pay a 1*s.* and 300*l.* will pay 1*s.* 6*d.*, 400*l.* will pay 2*s.*, and so on. Secondly, with respect to payments. Where neither the party lodging the money nor the party receiving has an account, the charge will be ¼ per cent. on sums not exceeding 500*l.*, the minimum charge being 2*s.* 6*d.* On sums exceeding 500*l.*, but not exceeding 3000*l*, the charge will be ¼ per cent. on the first 500*l.*, and ⅛ per cent. on the remainder. When the sums exceed 3000*l.* there will be the above charge for 3000*l.*, and 1*s.* 6*d.* on the excess. If on the other hand, the party lodging the money have an account, the commission on sums under 100*l.* will be 2*s.* 6*d.* per cent., the minimum charge being 1*s.* On sums of 100*l.*, and under 300*l.*, the charge will be 4*s.* 6*d.* per cent.; on sums of 300*l.*, and not exceeding 3000*l.*, it will be 1*s.* 6*d.* per cent., and on sums exceeding 3000*l.* it will be 1*s.* per cent.

The late Forgeries on the Bank.—We mentioned a few weeks back the particulars of the fraudulent transfer of 8000*l.* stock, belonging to Mr. Oxenford of the Customs, by Mr. Burgess, one of the clerks of the Bank of England, by the instrumentality of an accomplice, and the escape of the parties with that amount in gold. It appears that both the delinquents have been traced to America by John Forrester, that Burgess escaped being captured by embarking in an open boat at Boston in a dark night, and that the accomplice, Elder, was taken, but committed suicide in prison. From the long accounts which have appeared in the daily papers, we learn that the parties were supposed to have sailed in the Britannia steam-ship for America, but no positive information on the subject could be obtained. That they had gone on board there was no doubt, but it was represented that at the time they got on board there was only one berth available. After much minute inquiry, however, the Forresters could not learn that they had ever come ashore after having once entered the vessel, and Messrs. Freshfield, the Bank solicitors, immediately resolved to despatch John Forrester to make an experiment of his skill and energy in tracing the fugitives and the cash, and endeavouring to secure both men and money in the New World. In the course of the inquiries, which were carried on in a very peculiar manner, an intimate connection was found to exist between Burgess and Joseph Elder, who was known to be a horse-dealer, and the description of the latter individual having been obtained, was found exactly to correspond with that of the personator of Mr. Oxenford at the time the transfer was effected. John Forrester ascertained that the Britannia had sailed for Halifax on the 4th September, and application was made to the Lord Mayor, who rendered every requisite assistance. Depositions were prepared, and all measures were adopted for the apprehension of the parties under the treaty with America, Sir J. Graham authorising the whole of the proceedings. John Forrester and one of the clerks of the Bank started for Halifax on the 19th September, in the next steam-boat (the Caledonia) that left Liverpool. Upon arriving at Halifax the indefatigable officer found, to use his own language, "that he was all right." He ascertained that the fugitives had proceeded to Boston and New York. Thither he followed them, and from thence to Buffalo, Canada, and Magaia, and back again to Boston, where they, it appeared, resided—one of them in a house and land which he had purchased, the other in an inn. Having discovered that they had placed 7000*l.* in a bank, payment was immediately claimed upon the part of the Bank of England. This claim was immediately followed by the apprehension of Elder in his house. He was taken before one of the tribunals for examination, and was remanded for further examination next day; but he put an end to the inquiry by hanging himself with his pocket-handkerchief in the course of the night. Burgess was surrounded in the inn in which he resided, but ran out at the back door without hat or coat, and succeeded in getting into a boat in which were a pair of oars, and in escaping, aided by the darkness of the night, in the direction of some of the outward-bound vessels. Upon Elder were found 400 sovereigns, and amongst Burgess's papers were found 200 more, and the stocks and securities in which the 7000*l.* were invested, have since, it is said, been made over to the agents of the Bank. Thus, by the prompt measures adopted by the solicitor to the Bank, the establishment has succeeded in recovering the property of which it was plundered, with the exception of the mere expenses incurred by the pursuit of the persons who committed the offence. It is understood that great fears were entertained that the measures for apprehending the parties would fail, in consequence of an objection on the part of one of the judges to administer an oath to an affidavit. That difficulty, however, was overcome by the act of sending out a clerk from the Bank of England.

Death of Sir Gore Ouseley.—In our Obituary of this week is recorded the death of this respected baronet, who expired at his seat, Hall Barn Park, on Monday last. Sir Gore Ouseley was the second son of Ralph Ouseley, Esq., by the daughter of Henry Holland, Esq., of Limerick. He was born in 1770, and was consequently in the 75th year of his age. In 1806 he married the daughter of John Whitelock, Esq., and in 1808 was created a baronet. He was a Privy Councillor, a Knight of the Russian Order of St. Alexander, and of the Persian Order of the Lion and the Sun. In 1810 he proceeded to Persia as Ambassador Extraordinary and Minister Plenipotentiary, and subsequently went to St. Petersburgh. He is succeeded in his title and estates by his son, Frederick Arthur Gore, born in 1825.

Westminster School.—The "Eunuchus" of Terence will be performed this year by the Westminster scholars. The three nights will be Monday the 9th, Thursday the 12th, and Monday the 16th December; on the two latter of which there will be a prologue and epilogue spoken.

Central Criminal Court.—In consequence of the receipt by Sir W. Magnay, Bart., the late Lord Mayor, of a letter from Sir J. Graham, recommending the consideration of the project of discontinuing the evening sittings of the Central Criminal Courts, the experiment is about to be tried. On account of the shortness of the notice, it will not be possible to discontinue the evening sitting on the days appointed for the next session, but preparations will be made for testing the efficacy of the proposed plan in the second session of the mayoralty.

Sir Henry Pottinger.—A congratulatory address to Sir H. Pottinger, on his return to this country, is in course of signature among the merchants of London trading to the East Indies and China. The letter expresses the thanks of the merchants to Sir Henry for his services in bringing the differences with China to a speedy termination, and in procuring a fixed tariff, and the abolition of vexatious imposts. We learn also by the local papers that a public banquet is about to be given at Liverpool, to Sir H. Pottinger, "in testimony of his services in opening the East India and China trade." The Mayor will preside. On the same occasion a massive service of plate, raised by subscription, will be presented to that gentleman.

Rev. Sydney Smith.—This distinguished writer has been so seriously indisposed for some weeks, that the Rev. T. Dale has been obliged to undertake his duty at St. Paul's for the last few Sundays. We are happy to state that there is now no longer any ground for apprehension. The unfavourable symptoms were those of suppressed gout. The moment the disease took a definite form, Mr. Smith began to get better, and is no longer considered in danger. In fact, he already passes several hours each day in the society of his more intimate acquaintances.

Lord Byron's Monument.—It is stated that Thorwaldsen's statue of Byron, so long excluded from the precincts of Westminster Abbey, is about to be erected in the cemetery of Kensall-green.

Poor Law Union Houses.—The Poor Law Commissioners have issued letters to the boards of guardians of Union-houses, recommending the more easy access of friends visiting sick inmates of the Union-houses, and dispensing with the presence of the master or matron during such interviews.

The Will Forgers.—It is stated in an Edinburgh paper that a respectable young woman is on her way out to New South Wales, with the view of being married to Barber. She sailed from Greenock a few weeks ago, and was furnished with a free passage by Government. She belongs to the neighbourhood of London, and was, we believe, a governess in a private family.

Seizure of Messrs. Smith's Distillery by the Excise.—Some astonishment has been excited by the seizure of the distillery and rectifying house of Messrs. Smith, Thomas-street, Whitechapel. The stoppage of the business has existed about a fortnight, and as it will continue **until the revenue and excise causes are tried in the Court of Exchequer, which will take place immediately after the end of the present term, nearly the whole of the men** employed in the two departments have been discharged. Upon what grounds the seizure has been made is unknown. Although some of the accounts state that the firm had been in the habit of retailing spirits at a superior strength and lower price than other distillers, it is well known to the trade that the quality sent out commanded the highest prices in the market, and the house was never considered to come under the denomination of cheap sellers. As in all other establishments of the same kind, an excise officer was constantly on the premises, and during the whole period, until the commissioners stopped the trade, he was in the constant habit of seeing what was going on. At present no correct information can be obtained as to the exact amount for which the commissioners have made a seizure; whether they amount to 100*l.* or 100,000*l.* is unknown.

The Polish Ball.—On Tuesday night the dress and fancy ball in aid of the funds for the relief of the Polish refugees took place at Guildhall. The company began to arrive soon after 8 o'clock, and at ½ past 9 dancing commenced, and everything went on harmoniously, until 10 o'clock, when the Lord Mayor, accompanied by the Lady Mayoress, entered the hall. He was greeted with mingled cheers and hisses, but very few of the company took part in this discordant contest. The great majority allowed the Lord Mayor to pass by unnoticed, and considering the number of ladies present, and the occasion which had caused them to assemble together, this certainly was not an injudicious proceeding. The amusements of the evening did not entirely consist of dancing, but were varied by the introduction of a vocal concert, which pleasantly diversified the enjoyments of the evening. Dancing was then resumed, and kept up with great spirit to an early hour of the morning. Guildhall was quite full of company, and the funds for the relief of the refugees will derive no inconsiderable benefit from this ball. Among the company present were the Earl and Countess of Errol, the Earl of Munster, Lady Adelaide Fitzclarence, Countesses of Tankerville and Glengall, Lady M. Fox, Lord Dudley Stuart, Colonel Fox, M.P., Colonel L. Stanhope, Mr. Villiers, M.P., Sir W. Magnay, Mr. H. Baring, M.P., &c. Though the ball was announced as a fancy ball as well as a dress one, there were very few persons present in fancy dresses.

The Tottenham Churches.—The parish of Tottenham has been, for some time, in considerable agitation, caused by a dispute between the seatholders and attendants of the churches, and the clergyman of the parish, respecting the introduction of certain practices in the services of the church, which the parishioners consider as Tractarian novelties. The changes were first introduced at the parish church, and then at a church recently erected by subscription at Wood Green, and they were threatened, also, at the chapel on Tottenham Green called Trinity Chapel; but the proceedings of the subscribers to the Wood Green church has prevented their introduction at Trinity Chapel for the present. As soon as the innovations were adopted by the clergy at Wood Green, the subscribers remonstrated, and after an ineffectual correspondence, a meeting was called, at which there was so strong an expression of public opinion, that the clergy consented to refer the matter to the Bishop of London. A deputation accordingly waited upon the bishop, who strongly urged the parishioners to accede to the changes, which were, he said, in strict conformity to the Rubric. He declared that he would sanction no change that was not authorised by the Rubric, and expressed his determination to resist the introduction of Puseyite or Tractarian doctrines. After a long conference, in which it was evident that neither party would give way, the bishop agreed to give orders that the new forms should be suspended for 12 months. This was accepted by the deputation, who reported the result to a general meeting of the subscribers, when another angry contest took place between the clergy and the parishioners. Notice, however, was posted at the church-doors on Sunday last, signed by the vicar and other clergymen, announcing that the changes were suspended for a year. The innovations objected to are the omission of the anthem at the commencement of the service, the giving out of the psalms by the clergyman instead of the clerk, and the offertory, with a collection from pew to pew on the occasion of charity sermons, Queen's letters, &c. What will be the result of these proceedings cannot be foreseen, but it is said that two of the parishioners have offered to build new churches at their own expense, if the attendants at the old ones are obliged to leave through the continuance of the changes.

Consecration of Camberwell Church.—On Thursday morning the Bishop of Winchester consecrated the New Church at Camberwell, built on the site of the one destroyed by fire in 1842. The church, which has been erected at a cost of 14,000*l.*, will accommodate 15,000 persons. The design is in the style of the latter half of the 13th century, being the transition between the "Early English" and the "Decorated Style." The plan is cruciform, having a central tower and spire. The spire, which may be seen from a considerable distance in every direction, is 207 feet in height. The bishop having gone through the prescribed forms, preached a sermon appropriate to the occasion, and a large collection was made at the close of the service.

The Fog.—On Thursday morning the metropolis was enveloped in a thick fog, which was particularly dense in the northern portions. It somewhat cleared off towards noon, but about 4 o'clock it again came on, and as the evening advanced became of such intense density as to **equal the fogs of 1814. All the craft in the river were compelled to remain stationary throughout the afternoon;** and the steamers discontinued running. At 5 o'clock it was impossible that any omnibus, cab, or other vehicle, could move faster than at a walking pace, although most of them were preceded by links and carried lamps. Most of the drivers of cabs and carriages were compelled to lead their horses. It was dangerous also to pass over any of the metropolitan bridges. Foot-passengers found the greatest difficulty in proceeding through the streets, and persons were continually losing their way, while innumerable link-boys were offering their services. Shortly before 9 the fog had somewhat abated, but still continued very thick. At Hampstead, Highgate, Islington, &c. the weather was clear through the greater part of the day; but into Surrey the fog extended to a considerable distance.

Inquests.—At the inquest on the body of Mr. Samuda and his workmen, who were killed by the explosion on board the steamboat at Blackwall, noticed by us last week, the jury appended to their verdict a declaration that "death was caused by the false and improper construction of the joint of the main steam-pipe, and on its not being sufficiently secured; stating that they express this opinion in order that due caution may be used to prevent similar accidents, which it appeared to them may be effected by a collar or ring to prevent the severance of the pipes in future."—An inquest has been held on the body of Mr. Sergeant Andrews, whose suicide was also noticed in our last. After two adjournments in order to have a *post mortem* examination, it was proved by the medical witnesses that the wound in the throat was healing, and that there was nothing in it that could have caused death. Disease had been going on for some time in the lungs, and there was no doubt that death was produced by effusion of blood from some vessels of the left lung during a violent fit of coughing, and not from the wound. After a long inquiry the jury returned a verdict—"That the death of deceased was caused by hæmorrhage from natural causes, which produced a flow of blood into the lungs."

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Nov. 16; West Districts, 147; Northern, 191; Central, 183; Eastern, 218; Southern, 333; Total, 1072. Weekly average for the last five years, 946.

Provincial News.

Birmingham.—The inhabitants of this town have followed the example of the inhabitants of Manchester and the Metropolis, by establishing public baths and walks for the poor. For some weeks past a committee has been making preliminary arrangements, and on Tuesday a public meeting, convened by a requisition signed by gentlemen of all parties, was held in the Town-hall, with a view of carrying the measures into effect. The Mayor presided, and was supported by Lord Lyttelton, Lord Calthorp, Mr. Adderley, M.P.; Mr. Spooner, M.P.; Mr. Newdigate, M.P.; Mr. Muntz, M.P.; the Hon. and Rev. G. York; Mr. Joseph Sturge; Mr. Hill, Q.C., Recorder of the borough; the Rev. J. Garbett, Rural Dean; most of the municipal officers, and indeed the leading men of all parties, Tories, Whigs, Complete Suffrageites, and Chartists. Such a complete amalgamation and unanimity of parties was never before witnessed in Birmingham, and the meeting was extremely well attended by the working classes. The Mayor opened the proceedings by reading letters from Mr. C. Ingleby, Sir T. Gooch, the Bishop of Worcester, Mr. Dugdale, M.P.; Dr. Wiseman, of St. Mary's College, Oscott, &c.; all concurring in the object of the meeting. Lord Lyttelton then moved, and Mr. J. Taylor, of Moseley Hall, seconded, the first resolution—"That this meeting, considering the great extent, the dense and increasing population, of the borough of Birmingham, and the growing difficulties of obtaining for a large portion of its inhabitants ready access to places for ablution, fresh air, and healthy recreation, declares its opinion that the formation of public baths and public walks, or other open spaces for exercise and active sports, in the vicinity of the borough, would contribute greatly to the health, rational enjoyment, kindly intercourse, and good morals of all classes of our population." A Chartist, named Mason, also spoke in favour of the resolution, expressing his conviction that this movement in favour of the labouring classes was the beginning of a new era in British society. Lord Calthorp then moved, and the Rev. J. Garbett seconded, the next resolution—"That it is the opinion of this meeting that public baths be the first object carried out, and that the committee, about to be proposed, be requested in the first instance to take measures for the erection of four sets of public baths in the most convenient parts of the borough." The Hon. and Rev. G. York moved, and Mr. Spooner, M.P., seconded, a resolution in favour of a subscription to carry out the two previous resolutions; and Mr. Harlow moved, that all other lodges and benefit societies should be called upon to follow the example of lodges 1 and 2 of the United Brothers, and send in subscriptions to the proposed fund. Mr. Newdigate, M.P., moved, and Mr. T. E. Lee seconded, a motion for the appointment of a committee. All these resolutions having been adopted unanimously, Mr. Hill the Recorder, Rev. Mr. Dawson, Mr. Sturge, Mr. Muntz, M.P., and other gentlemen addressed the meeting; and at the close the Mayor announced that the subscriptions already amounted to about 2700*l.*

Bridport.—At a dinner given by his constituents last week, to Mr. Baillie Cochrane, M.P., for this borough, that gentleman addressed the meeting in a speech of great length, which has attracted general attention. After stating his views on the present state of the country, and expressing his determination to uphold agricultural protection, Mr. Cochrane adverted to the subject of Education. "Education" he said, "is necessary, but it is not the education of literary institutions and mechanics': it is worse than irony to propose giving [illegible] to read when they scarce **have time to read the Bible. Charity is necessary, but** it is not the charity which plants roses round the porch and leaves the shattered roof; which provides men with public baths when they cannot obtain water to drink, for such is really the case in some parts of the metropolis; no, all this kind of charity is pretty and graceful, but you cannot make a plaything of poverty, or cast veils of romance over suffering. Let us contemplate for one **moment what real suffering is; turn from the crowded** thoroughfares of the great city, and but a few yards distant will be found narrow lanes, without ventilation, and teeming with noxious vapours; and then look into one of those roofed, squalid, broken-down miserable hovels without fire-places, for why should fire-places exist where there is not a penny to purchase firing with? the wind whistling through the patched doors and windows; from these damp cellars issued forth creatures of low and fearful aspect—the man and the woman, the infant, and the decrepit and withered, all alike in rags and tatters. Oh, it is horrible in very truth—it is fearful wretchedness; and, alas! a fearful wretchedness which induces fearful vice; for in too many instances degrading passions are so stamped upon the features that it is hard to believe that this is man in whose own image the Creator created him. Is this an overdrawn picture? I do not think so. It is attested by men of all parties and shades of opinion. Mr. C. Buller has told us that in London alone there were 15,000 milliners killing themselves by work in close rooms; but if all this is true, is it a time to lay such a stress upon mere education? Must not the efforts to improve the social commence with efforts to ameliorate the physical condition of the people?" He then dwelt on the distresses of the labouring classes, and their remedy, expressing his belief that free trade, the allotment system, the recurrence to the small farm system, rational education, and the abolition of the new Poor-Law would not effect much until some check is put upon machinery. In conclusion, he said, "We are moving rapidly forward, and whither? No man will venture to say what ten years shall bring forth. Shall our commerce still sweep from the Indies to the poles, or shall the spots that knew us once know us not again? Mine is no prophet's voice to declare the future, but of this I am convinced, that the surest pledge of the stability of our commerce—of our greatness—is to protect the poor man, who is the humble instrument of that greatness, and in the days of our prosperity to remember that there are moments of adversity, when dullness falls upon nations as upon individuals, and when the many who are now the lowly and weak may become the powerful and the strong."

Brighton.—A meeting of the inhabitants of this town was held on Monday, for the purpose of receiving the report of the committee appointed at the public meeting held on the 21st ult., to consider whether it will be beneficial to the inhabitants that the borough should be incorporated, and the propriety of petitioning Her Majesty in Council for a charter of incorporation under the provisions of the Municipal Corporations Acts. The report recommended the petition for a charter, but an amendment was moved that it be brought up again that day three months. After some discussion it was resolved to postpone the meeting for a month, in order to give time to the inhabitants to consider the report.

Durham.—A forgery of 5*l.* notes of the Durham and Stockton County Bank was discovered on the 30th ult., by one of them being taken to the Stockton Post-office for change, and a vigilant search in consequence was made for the parties suspected of the forgery. Since then the whole of them have been apprehended and committed for trial. There are four individuals implicated in the affair, all hitherto accounted respectable parties, and from their being well known in the places where they resided, their apprehension has excited considerable sensation. The principal forger is a person named Henry Russell, formerly of Stockton, but for a few weeks past master of the National School at Barnard Castle. Accomplices with him are a person called Buglass, a spirit-dealer in Sunderland, and Matthew and James Watson, father and son, who have resided for some time at Doghill, about half-a-mile from Stockton, and lately carried on the brewing and corn facting business. On the last day of the examination Russell made a full confession, and gave a statement of their operations. He said they commenced forging in May, he being the sole originator of the proceedings. The two Watsons assisted him, and the plate from which the notes were printed was engraved by the electro-magnetic process, with the exception of the managing director's name, the name of the persons entering the dates and the numbers, which were afterwards supplied by the pen. They were printed at Watson's house, on paper which he had purchased for the purpose, by a small press like a linen press—40 had been printed, but they had only succeeded in issuing 20. Buglass was in company with the Watsons when one of the notes was passed. Only eight of the notes have yet

been found, and they were all passed in the neighbourhood on the two days preceding their apprehension.

Exeter.—A meeting of the whole chapter of Exeter Cathedral, consisting of the Dean, Chancellors, Canons, and Prebendaries, with the Archdeacons of the Diocese, was held last week at the Chapter House, having been convened by the special request of the Bishop, for the purpose of aiding his Lordship with their deliberations on the propriety of a regular conformity to the Rubric by the clergy throughout the diocese of Exeter. The meeting was private, but it is said that it consisted of the Bishop, the Dean, six Canons, and eleven Prebendaries. On the question of approving a more strict obedience to the Rubric the Chapter divided, and the approval was carried by twelve votes to six.

Gloucester.—The local papers state that the liberal donation of 500*l.* has been presented, in the most handsome manner, to the rector, by the executors and devisees of the late James Wood, Esq., to enable him to complete the restoration of the church of St. Mary de Crypt.

Helston.—Considerable sensation has been produced, not only in Cornwall and throughout the whole diocese of Exeter, but in other parts of the kingdom, by certain proceedings connected with the introduction of Tractarian practices in the parish church of this town. The curate, the Rev. Walter Blunt, a zealous disciple of the Tractarian school, having displayed extraordinary activity in the revival of certain obsolete usages of the Church which proved peculiarly distasteful to his congregation, they, after many respectful expostulations, determined to prefer a complaint of his conduct to the Bishop of Exeter, who appointed three commissioners (one of them a relative of his own) to investigate their allegations and report to him upon them. The inquiry accordingly took place, the principal promoter of the complaint being Mr. Hill, one of the churchwardens, and the result has this week appeared in the *Times*, occupying several closely printed columns, independent of the bishop's long and elaborate judgment. The charges were not confined to Mr. Blunt's Tractarian practices, but included several other accusations, some of which are admitted to have been well-founded. On the greater part of them, however, the bishop has pronounced that gentleman to be right and his congregation wrong. Even on those parts of Mr. Blunt's conduct of which his lordship disapproves, his censures are extremely indulgent; whilst his condemnation of the congregation is stern and unequivocal. In the letter to the bishop, containing the charges alleged against Mr. Blunt, Mr. Hill states the motives which led to his appeal. The parish had been thrown into confusion by the pertinacity of Mr. Blunt; his congregation had diminished to less than one-half—the wealthier communicants attending service in neighbouring churches, and the poor either remaining at home or resorting to Dissenting places of worship. To many who did continue to attend, the Sabbath was to them usually a day of excitement utterly subversive of the temper of mind usually associated with that sacred day. Mr. Hill adds, that he could mention an occasion on which "ladies had been incapacitated from the performance of their religious and other duties, for the remainder of the day." The result of all this was stated to be that the churchwardens have been left without funds for those necessary expenses which cannot be legally included in a church-rate; and that they cannot even attempt a church-rate, seeing that there are not two persons in the whole town who will propose one. The charges against Mr. Blunt are eight in number:—1. "The use of the surplice in the pulpit." Of this practice the bishop approves.—2. "The substitution of an extempore dissertation on the Liturgy, for a sermon." Of the habit of preaching extempore the bishop altogether disapproves; but as he never told Mr. Blunt his opinion, he says that he cannot blame him for adopting the practice.—3. "The disuse of prayer before and after the sermon." The bishop pronounces this to be in accordance with the rubric, but its omission is said to be justified by practice.—4. "The substitution of an extempore lecture on one of the Lessons, for a sermon in the evening." The bishop admits this to be an innovation which ought not to have been hazarded without previously ascertaining that it would give no offence to the congregation.—5. "The compelling all persons to remain in the church on Sacrament Sundays until the conclusion of the exhortation, on pain of excommunication, *ipso facto*." The bishop describes this as the most mischievous, and in its progress the most irregular and the least justifiable of all the particulars stated against Mr. Blunt.—6. "Refusal to read the Lord's Prayer or administer the Holy Communion to a man who had been baptised by a Roman Catholic." Approved.—7. "Refusal to bury the corpse of a young man who had been baptised by a Dissenting minister in a colony where no Church minister was to be found." Approved.—8. "Refusal to marry persons, unless they could prove satisfactorily they had been baptised." The bishop says that this would have been approved, if the objection had been made before the publication of the banns. Beside these charges it was alleged (among other causes of dissatisfaction with his ministry), that Mr. Blunt "compelled women coming to be churched to the exposure and fatigue of kneeling at the rails of the communion table, instead of allowing them to remain in the seat appropriated for the purpose." Approved. "That he dismissed the church singers, and substituted the national school boys, whose ignorance of music caused them to derange the devotional feelings of the congregation." Approved. To these opinions there succeed some general remarks, addressed not only to Mr. Blunt, but to his parishioners, in which the bishop admits that Mr. Blunt has been culpably indiscreet, but severely censures the congregation for their opposition to him. The bishop concludes his judgment with calling on Mr. Blunt "to be more cautious than he has hitherto been: especially to avoid all extempore addresses from the pulpit—a practice not safe to any man, but most hazardous to a fervid and zealous mind like his." Let him, he says, be content with performing the worship of God according to the real ordinances of our Church, in all their fulness, if he will, but also in all their simplicity and all their purity. Let him avoid all unauthorised innovation; above all, that worst species of innovation, the revival of bygone usages not ordered by the Church, which are associated in the minds of the people with the remembrance of the superstitions and corruptions of Rome. "In the course of this investigation," says his Lordship, "we have seen much of violence and unseemly provocation on both sides; too much certainly, to allow either party to look back upon it with feelings of exultation, as on a triumph over an opponent. Yet, it can be, and, I trust, will be, made by both an occasion of a far better triumph—a triumph over prejudices, temper, passions—over feelings, natural, it may be, but surely not on that account less requiring that they be subdued. Instead of perpetuating strife by publishing statements and counter-statements, let me express my hope, or rather my earnest entreaty, which churchmen will not on such an occasion suffer their Bishop to address to them in vain—that as far as is possible all may be forgotten—every document suppressed—this my judgment with the rest."

Hurst.—Another controversy on the subject of Tractarian innovations has taken place in this parish. The Rev. Mr. Cameron, the perpetual curate, having determined to revive the weekly offertory, Mr. Walter, of Bearwood, late M.P. for Nottingham, and proprietor of the *Times*, remonstrated against the introduction of any changes in the services of the Church. Not being successful in his remonstrance to Mr. Cameron, he took the opinion of an eminent civilian as to the legality of the changes, but the curate declared that he could not attend to legal opinions, being bound by solemn vows to enforce the rubric. Mr. Walter then appealed to the Bishop of Oxford, who replied in the following terms:—"As there appears to me to be nothing in Mr. Cameron's course, or mode of introducing the offertory, which is deserving my censure, I do not see there is anything which calls for my remonstrance."

Kelvedon.—The remains of the late Lord Western were interred in the church of Rivenhall, on Wednesday the 13th. By the will, which is dated the 17th April last, Lord Western entails all his estates in strict settlement on Mr. Birch Western, of Tattingstone-place, Suffolk; with remainder to his sons and brothers, successively, and their heirs male; with remainder to Mr. J. Western, of London, and his heirs male. H. C. Tuffnell, Esq., the Rev. J. Page Wood, Bart., and James Western, Esq., are executors and trustees. By a codicil of September 29, his lordship bequeaths some pecuniary legacies, and makes various provisions for his servants and dependents. To each of his agricultural labourers who have been in his employ for 10 years, the number of whom are 50, he has left 10 guineas.

Liverpool.—Another serious collision occurred in the Irish Channel on Friday se'nnight. It appears that the Firefly schooner, belonging to Messrs. Maxwell and Co., left Liverpool on Wednesday for Africa for palm oil, and had arrived between Point Lynas and the Skerries, when she came in contact with the Britannia steamer, from Dublin. The collision took place at midnight. The Firefly was so much injured that she sank immediately afterwards; but there was time to save the whole of the crew, who refused to leave the sinking vessel. The collision was altogether accidental, and arose from the dark and thick weather prevailing at the time.

Manchester.—The subscription for the public park goes on prosperously, having last week exceeded 700*l.* There is also a continual and regular flow of subscriptions from working men, under 5*s.* each, of which there were 60 the week before last, and about 30 last week. The list gives abundant evidence of the interest taken by all classes in this excellent object. The total amount of the subscription at present is 26,701*l.*

Newcastle-upon-Tyne.—An alarming occurrence took place last week, at St. Peter's Quay, about 3 miles below this town, the surface of the ground, for some acres in extent, having been affected with what in this district is called the creep, being a sort of incipient earthquake, by which considerable destruction has been done to property in the neighbourhood, the extensive building yard of Messrs. Smith, the ship-builders, having been rendered for a time entirely useless. The workmen heard a loud noise and observed the surface of the ground moving. When this heaving ceased, the men returned to the building yard, and found the ground rent in various directions, presenting chasms several feet in depth; the bottom of the spacious dry dock, capable of admitting vessels of the largest size, was thrown up in confusion, the sides rent, and the whole presented a scene of complete destruction. The quay next the river sunk several inches, and the bed of the river, which before was high and dry at low water, is now covered to the depth of from 18 to 24 inches. The water in the river was agitated, and the motion felt on board the vessels lying near. The men employed in the building-yard have been discharged, and all work suspended, and it will be some time before the injury can be repaired. Fortunately, no lives have been lost.

Oxford.—The Archbishop of Dublin and the Bishop of Kildare have addressed the Board of Heads of Houses on the subject of the prevailing errors in the University; and a committee is now sitting to concert measures for checking their progress. Mr. R. Ley, of Brasenose College, a connection of the Rev. Isaac Williams, has avowed himself the author of a report that Mr. Newman had written to Mr. Williams, intimating his probable secession from the Anglican communion.—It is stated that the new Vice-Chancellor, at the request of the Master of Balliol, has appointed a secret board of six to sit in judgment on the lately published work of Mr. Ward, in order, if possible, to obtain its condemnation, and his expulsion from the University, his own College having refused to take any steps in the matter. The tribunal now sitting is composed entirely of persons opposed to Mr. Ward's views; the late Vice-Chancellor, Drs. Cramer and Cardwell, the Provost of Oriel, and Master of Balliol himself, are among the number. Mr. Ward, it is said, has had no notice of the step taken, or any invitation to defend himself.—At a meeting of the President and Fellows of Magdalen College, on the 7th inst., to consider the designs submitted by the several architects for the choristers' schools and masters' buildings, the design submitted by Mr. Derick was selected for the first prize, and that of Mr. Pugin for the second. There were 17 competitors.

Stapleford.—The papers contain long accounts of a very serious conflict between the tenantry of Lord Harborough and the surveyors and workmen of the Peterborough and Midland Railway. The railway party were desirous of entering his lordship's estate, for the purpose of measuring their intended line, and Lord Harborough was determined to prevent the encroachment. The riots lasted three days, and some hundreds of people on both sides took part in them. On the third day a party of nearly 100 men climbed over the park paling on the part nearest Oakham, headed by the company's solicitor and surveyors, and commenced measuring with three or four chains; the party being so formidable, and his lordship's retainers having been dispersed at several points in the park, containing 800 acres of land, the force at the part where the breach was made was too small to resist them, and were mere spectators. By the time the surveyors had reached opposite to his Lordship's cottage, where he resides, Mr. Fabling, his steward, on a pony, came up, bringing with him a few of his troops. Mr. Cope, the head surveyor, told him that if he wished not to be hurt, he had better retire; and on his refusing to do so, the railway men were ordered to remove him. Mr. Fabling ordered the measuring chains to be taken up. His situation at that moment was perilous; but his Lordship's tenants and servants rallied round him for protection, and began to feel confidence in their leader and their own strength, and the fight became general. To describe the scene that followed is impossible. The lock-keeper of the Oakham Canal, a powerful man, rendered great service to his Lordship, sending his opponents head over heels at every blow; the noise was so great that it was heard in the village two miles off. The spikes of the railway party were thrust into the sides of the defenders of the park, and after a battle of about five minutes, and many broken heads, wounded faces and sides, the lower grade of the intruders gave way. At this moment his Lordship, accompanied by Lady Harborough, appeared, but being weak from a very severe illness, was not able to get near the scene of action. Noise of the affray having brought together more parties of his Lordship's men, it was evident that the railway party must beat a retreat, their staves and chains having been broken into many pieces. Mr. Fabling, who was not injured, would not let the ten principal persons get out of the park without giving their names, which they did with some reluctance, and warrants have since been issued by the magistrates for the apprehension of the other rioters.

Stockport.—For some time past the factory operatives of this town have been at variance with their employers respecting an advance of wages. The improvement in the state of trade induced the workpeople to think that they should share its advantages; and about a month ago the spinners of this town issued a circular to the masters, in which they asked for an advance of 10 per cent. for hand-spinners, and 20 per cent. for self-acting minders. The masters finding that their prices were 1 per cent. lower than those of their neighbours, advanced 5 per cent. to all the hands in their employ; but the hands were still discontented, and demanded a further advance. This the masters have refused, and 12 to 14 mills have struck. At Ashton, Oldham, and other places in that district, similar disputes have taken place, and generally with the same results.

St. Asaph.—The arrival of Lord and Lady Dinorben at their restored hall, on Thursday the 14th, was celebrated with great festivities by his lordship's tenantry. According to previous arrangements a cordial and enthusiastic welcome was given to the noble owner of Kinmel Park. It will be remembered that this splendid mansion was a few years since entirely destroyed by fire, and his lordship has subsequently had it rebuilt on a scale of princely grandeur, at a cost of nearly 100,000*l.* The mansion has within the last month been completed, and all the necessary preparations were ordered for the reception of Lord and Lady Dinorben, and Lady Gardiner, daughter of his lordship, on the 14th. A committee had been formed, intrusted with the various regulations for the reception, among which were a procession of the tenantry, and other marks of respect from the inhabitants at large. A congratulatory address was also presented to Lord Dinorben by his friends and neighbours, signed by upwards of 2000 persons.

Sunderland.—The guardians of the poor of the Sun-

derland Union, at a meeting last week, adopted resolutions condemnatory of Sir J. Graham's proposed Bill for the amendment of the law of parochial settlements. It was also determined to oppose the Bill should Sir J. Graham persist in bringing it before Parliament.

Windsor.—On Saturday Baron Talleyrand, the Count de Noailles, and M. de Rabaudy, arrived at Windsor, from the French Embassy, for the purpose of having an interview with Mr. Clarke, the Mayor, having been commanded by His Majesty Louis-Philippe to present him with the sum of 5000f. (200*l.*) to be distributed amongst the poor and necessitous of the town during the ensuing winter. Two gold snuff-boxes have been presented from the King of the French to the inspectors of police who were on duty at the Castle during the visit of His Majesty. The female domestics also connected with the suite of apartments occupied by His Majesty, were likewise presented with valuable rings set with diamonds and other precious stones.—On Tuesday, as Prince Albert was galloping through the Great Park, towards the Castle, followed by his German groom, the horse on which the latter was riding dashed among the trees, and carried the groom against a projecting branch, by which he was brought to the ground severely injured. The horse was a vicious animal, and after knocking down the son of a gentleman residing in Windsor, but, fortunately, without injury, was secured just before it reached the lodges in the Frogmore-road. The Prince was not aware of the accident until after he had reached the Castle.

Yarmouth.—On Tuesday a poor woman, named Candler, who kept a flour and grocery shop in Market-row, in this town, was murdered in the most cruel manner. When found, she was lying in her shop quite dead, her throat having been cut with a table-knife, while her hands were pinioned; the till had also been robbed. The Jury, at the inquest, returned a verdict of Wilful Murder against some persons unknown, but the magistrates have apprehended some bad characters living in the neighbourhood, and it is believed that they have obtained a clue to the discovery of the murderer.

York.—The Archbishop of York has issued a pastoral letter to the clergy of his diocese, on the subject of collections for the extension of education on the principles of the Established Church. His Grace states that the rapid increase of schools, which is happily taking place throughout the country, renders it a matter of pressing and paramount importance to the spiritual interests of the diocese to provide methods superior to those which have been hitherto in use for training teachers of youth. There is not as yet any permanent establishment for the training of schoolmistresses, an object of scarcely less importance than the training of masters. On these accounts it is proposed to appropriate the present training-school at York to the former purpose, and to erect a new one for the latter. The cost of obtaining an adequate site, and of erecting a building sufficiently commodious is estimated at 8500*l.*, of which a contribution of 3500*l.* has been promised by the Committee of Privy Council, if the remainder can be raised in the dioceses. The actual funds of the York Diocesan Board of Education are altogether inadequate to furnish the quota of 2500*l.*, the share which the diocese of York is called on to contribute towards the undertaking. His Grace therefore recommends to his clergy that a general effort should be made throughout the diocese to obtain donations for a building-fund, as well as an increase of support to the permanent expenses of the institution.

Railways.—The following are the returns for the past week:—Birmingham and Gloucester, 2249*l.*; Bristol and Gloucester, 949*l.*; Eastern Counties, 3843*l.*; Edinburgh and Glasgow, 2153*l.*; Great Western, 14,567*l.*; Grand Junction, 7782*l.*; Glasgow, Paisley, and Ayr, 1360*l.*; Great North of England, 1686*l.*; London and Birmingham, 14,509*l.*; South Western, 5181*l.*; Blackwall, 680*l.*; Greenwich, 716*l.*; Brighton, 4278*l.*; Croydon, 369*l.*; Liverpool and Manchester, 4240*l.*; Manchester, Leeds, and Hull associated, 6500*l.*; Midland, 9520*l.*; Manchester and Birmingham, 2822*l.*; Newcastle and Carlisle, 1610*l.*; Newcastle and Darlington, 953*l.*; Preston and Wyre, 293*l.*; South-Eastern and Dover, 4034*l.*; Sheffield and Manchester, 579*l.*; York and North Midland, with Leeds and Selby, 2194*l.*—On Saturday, and again on Monday, an extra *Gazette* was published, consisting together of 56 sheets, containing almost exclusively notices concerning Railway and other private bills. If the country be not wholly cut up into railways, the Legislature will be overwhelmed with the toil of examining the numberless projects which will next session be submitted to it.—A circular to the Railway Companies has been issued from the War-Office, referring to the Act of last session, which renders it obligatory on the proprietors of the several existing and all future railways authorised by or requiring further powers from Parliament, to convey the military, their baggage, &c., at fixed rates, and stating that the Secretary-at-War considers it proper that the existing contracts with the railway companies for the conveyance of Her Majesty's troops should be revised, and that, if possible, the rates of charge and general terms for their conveyance should be the same upon all the railways in the United Kingdom. The circular expresses an opinion that the rates fixed by the Act will "afford adequate remuneration for the service performed," and an early answer is requested as to whether the company addressed, if not coming under the Act, will consent to these terms.—It is understood, from undoubted authority, that it is the intention of the directors of the Great Western Railway to reduce the fares on the whole of the line, in addition to the advantages afforded by the penny a mile train for third-class passengers. It is also in contemplation to run a train for first-class carriages only, to perform the distance between Exeter and London in five hours.—In consequence of the preliminary arrangements of the direct Windsor Railway having been commenced at so late a period, Friday being the last day for giving the usual notices in the *Gazette*, and so many questions and interests of a delicate nature being involved, the provisional committee came to the following resolution:—"That inasmuch as the committee, after the greatest diligence and anxiety, have not hitherto obtained the definite consent of the Crown to their undertaking, so as to enable them to proceed to Parliament in the ensuing session, they have found it necessary to adjourn their further proceedings until the subsequent session, when they trust they shall be enabled more completely to carry into effect the intentions of the promoters of the project; and that the secretary be requested to send a copy of this resolution to the subscribers, who will receive intimation of future proceedings at the earliest moment." Accounts reached town last night from Nottingham, stating that an accident occurred on Thursday on the Midland line at Beeston, about four miles from that town. At 10 minutes to 3 o'clock, the London train came into collision with a Derby train, and the result was awful. The stoker of the London train, and four passengers, are reported to be dead; and many others severely wounded. The confusion, the dismantled engines, the broken carriages, but above all, the cries and groans of the unfortunate sufferers were represented as most appalling.

IRELAND.

Dublin.—In the Court of Queen's Bench last week, on the motion of Sir C. O'Loghlan, the Court ordered the judgment of reversal to be entered upon the record, and the recognizances of the defendants to be handed over to be cancelled.—The collection of the O'Connell tribute took place on Sunday at the various Roman Catholic chapels in the metropolis. The following is the official return, so far as at present known:—Metropolitan Church, Marlborough-street, 536*l.*; St. Andrew's, 457*l.*; St. Michael and John, 255*l.*; St. Catharine's, 140*l.*; St. Paul's, 160*l.*; St. Michan's, 209*l.*; St. Nicholas's, 130*l.*; St. James's, 110*l.*; St. Audeon's, 88*l.*; Rathmine's parish, 160*l.*; Donnybrook ditto, 72*l.*; Booterstown (no return); Kingstown, 110*l.*; Rathfarnham (no return); Clontarf (no return); Castleknock (no return); Sundries at office, 255*l.* The total will be between 3000*l.* and 4000*l.*—The Roman Catholic prelates have been holding their Synod during the week at Marlborough-street Chapel. The Charitable Bequests Act of last session is the chief subject of discussion among them. It is said that they will agitate for a repeal of the statute, or a very extensive change in its provisions.—The *Cork Examiner* states that the Lord Chancellor is about to supersede many more magistrates. Circulars, they say, have been lately sent to all Repeal magistrates, desiring to know if they are members of the Repeal Association.—It is said that the divinity students of Trinity College intend shortly to have a public meeting, to protest against any interference of Sir Robert Peel with the University, and the Rev. R. J. M'Ghee will be requested to take the chair. Dr. Elrington, the Regius Professor of Divinity, in his opening prelection this term, mentioned to his class the possibility that this might be the last year in which he would be privileged to address them as an officer of "a Protestant" University.—It is stated, in an evening paper, that the agitation of Repeal cost the people of Ireland, in 12 months, the sum of 121,264*l.*, of which 56,000*l.* are devoted to the personal and private uses of Mr. O'Connell, and the remainder at his disposal in whatever way he chooses to apply it.—Mr. O'Connell is again about to re-establish the courts of arbitration, under whose authority the laws of the country are to be henceforth dispensed. He has announced this intention in a letter to Dr. Gray, the editor of the *Freeman*, to whom, as the original projector, is intrusted the task of "working out sufficiently the plan of such tribunals."—Mr. S. Crawford has published two more letters on the affairs of Ireland, advocating the plan of Federalism. Mr. Crawford's letter is adverted to in a letter from Mr. O'Connell which was read at the Repeal Association, and will be found below.—The weekly meeting of the Association took place on Monday, Mr. Clements, barrister, in the chair. Mr. M. O'Connell introduced to the meeting Mr. Ringrose, of London, who handed in 13*l.* 13*s.* from the Maze Ward, and 5*l.* 2*s.* from the St. Patrick Ward, and then addressed the meeting. He bore testimony to the ardour and zeal of the Repealers of London, and declared that they would never relax in their exertions till the object for which they were contending should be achieved. Mr. M. O'Connell moved a vote of thanks to the subscribers, and highly eulogised the spirit and indomitable love of country by which their friends in London were actuated. During the last year they had remitted 1900*l.* to the Association, and he expected that at the termination of the present year it would be much more. He regretted to say that latterly a spirit of insubordination had manifested itself in several quarters of London, and he had the disagreeable duty of moving the expulsion of an individual who had acted in such a manner as to render it impossible for them to continue his name any longer on the books of the Association. They were bound to preserve the unity of the movement, and therefore he was under the necessity of moving that the name of Mr. Humphrey should be struck off the list of Repeal-wardens. The resolution was then put and carried. Mr. M. O'Connell then said he had now a more pleasing task to perform. It was that of submitting to the meeting the following letter from the Liberator to Mr. Ray:—

"I have just received the *Evening Freeman* of the 14th, containing Mr. Sherman Crawford's third letter. I of course, submit it to the consideration of the Association; but I cannot allow one post to elapse without expressing my deep regret that the letter, in my humble judgment, contains one single principle or matter of detail which ought to be adopted by the Irish people in their future struggles for the restoration of Irish nationality. I may be greatly mistaken, but, as far as I can form a hasty opinion, Mr. Crawford's plan seems to me to be an elaborate scheme to make matters worse than they are at present, and to reduce Ireland from a nominal equality with England to a real and vexatious provincial degradation. But there is one thing quite certain, and that is, that Mr. Crawford should be treated with the utmost courtesy and respect; nothing personal, nothing offensive, should be said to him or of him; his plan should be discussed in language of perfect politeness and unmixed civility; he should be argued with—reasons should be given for the condemnation of his scheme of legislation—no cry should be raised—no nickname, as 'Federalist,' should be given—that name itself should be treated with becoming regard, and if the Association agree with me in the rejection of *his* Federalism, let us do it in a mode which can call forth no pain or create irritation; above all, let us do nothing which could discourage others from following the manly example he has given of laying his plan boldly and in detail before the Irish people. I now beg leave to give notice that I will, on Monday, the 25th, move the appointment of a select committee to examine and report upon Mr. Crawford's project of Federalism, together with such observations in reply as may appear requisite or suitable. It will be observed that Mr. Crawford has, as usual with him, gone out of his way to make an attack upon me, I heartily forgive him. I bear his blow cheerfully. I will not quarrel on my own account with any person or paper until a *real* Irish Parliament is assembled in College-green. At me who pleases. I will apply all my attention to the sacred cause of Irish liberty—none to the individual. It is a noble cause that in which we are engaged—the restoration of legislative independence—the production of prosperity in our beloved fatherland—Hurrah, then, for Repeal!"

Capt. Broderick having handed in several remittances, remarked that it was gratifying to observe the zeal which Irishmen, in all parts of the world, were exhibiting in behalf of their suffering country. Mr. M. O'Connell handed in 40*l.*, the second remittance for the present year of the Repealers of Sydney. The remittance was accompanied by an address to Mr. O'Connell. Mr. M'Nevin, Mr. Maher, M.P., Dr. Nagle, and others, handed in subscriptions, and after the disposal of general business, the rent for the week was announced to be 337*l.* Mr. O'Connell left Derrynane Abbey for Tralee on Monday. He was expected to sleep at Newcastle, county Limerick, on the 19th, from whence he would make his entry into Limerick on the 20th. On the 21st he was to proceed more than half way towards the metropolis, so as to reach Dublin to dinner on Friday the 22d. He is expected to attend the meeting of the Repeal Association on Monday the 25th.—The Dublin *Gazette* of Friday contains no less than 22 railway notices, viz.:—Extension of the Ulster Railway to Armagh; Wexford, Carlow, and Dublin; Dublin to Mullingar and Athlone; Londonderry and Coleraine; Londonderry and Enniskillen; Kilkenny Junction; Newry and Enniskillen; Dundalk and Enniskillen; branch from Dublin and Drogheda to Howth; Waterford and Limerick; Waterford and Kilkenny; Extension from Athlone to Galway; Kingstown and Waterford; Dublin and Cavan; Limerick and Ennis; Cork and Limerick; Coleraine and Enniskillen; Cork and Bandon; Dublin and Belfast Junction; Irish Great Western from Dublin to Galway; North and North Western from Dublin to Armagh and Enniskillen.

Cork.—A meeting was held in this town last week in favour of the establishment of provincial colleges. Mr. Wyse, M.P. presided, and the following resolution among others was adopted:—"That we recognise in the recent declarations of influential members of Her Majesty's Government an acknowledgment of the want of adequate means to meet the intellectual demands of the country, and an approval of the principles upon which we seek an extension of collegiate institutions by the State; and that we therefore approach the Throne and the Legislature with sanguine expectations of obtaining, in the next session of Parliament, a legislative sanction for the establishment of the first of all civil institutions—a general system of public education, consonant with the spirit and feelings of the people, and in every respect thoroughly and permanently national."

Tipperary.—Three more murders are reported this week. A man named M'Genissay has been murdered near Brittas, on his return from the Quarter Sessions of Thurles, where he had been obtaining a decree for the small sum of 30*s.* A man named Maloney has been murdered at Kilcommon, and a man named Ryan has been murdered near Thurles by a person of the same name.

SCOTLAND.

Edinburgh.—The Edinburgh Papers of Friday announce the sudden death of Dr. Abercrombie, of that city. He had been slightly indisposed for some time, but was able to attend to his professional duties to the last. On Thursday morning he was found by his servant lying dead in his own room. He was carried off by a fit of apoplexy. Dr. Abercrombie was eminent in his profession, and was held in the highest respect by his medical brethren. He was a man of refined literary taste, and had a philosophical cast of mind. He is the author of various popular works on moral and intellectual subjects, and was upwards of 60 years of age.

Glasgow.—The election of Lord Rector of the University of Glasgow took place on Friday. The candidates were the Earl of Eglintoun and Mr. Rutherford, M.P., late Lord Advocate for Scotland. The votes were for Mr. Rutherford, 277; for Lord Eglintoun, 185; majority, 92.

Dundee.—A subscription is in progress for the establishment of public baths for the working classes in

Dundee. Her Majesty and Prince Albert have hitherto confined their contributions to the public baths of the metropolis, but have made an exception in favour of Dundee, in consequence of their having so recently landed there, by presenting 100*l.* to the funds.

Miscellaneous.

Total Eclipse of the Moon.—Another total eclipse of the moon will take place to-morrow (Sunday) night, and will be visible at Greenwich, as well as in all other parts of the world which have then the moon above their horizon. The eclipse will commence at 8h. 36 9m. P.M., mean time at Greenwich. Total darkness will begin at about 10h. 58m. P.M.; and end at 12h. 31m. A.M. on the morning of Monday; and the whole eclipse will finally terminate at 2h. 52·1 m. A.M.

Salubrity of North Wales.—A correspondent "Cambrensis" residing near Mold writes, that in a parish where he has property, containing 450 souls, there has been only one funeral since the 1st January—10½ months. He asks, "Can any of your correspondents adduce a similar or superior instance of the salubrity of the present year?"

Law.

EXCHEQUER CHAMBER. Crown Cases. (Before the 15 Judges.) *The Queen* v. *Robert Gower Grimwade.*—The following case was reported by Mr. Baron Alderson:—The prisoner was tried before me at the last assizes for the county of Suffolk, upon an indictment which contained three counts. The first count charged that the prisoner knowingly did send to Sir Joshua Rickets Rowley, Bart., a certain letter with a certain fictitious signature, to wit, the signature "A Polstead Labourer," subscribed thereto, directed to the said Sir J. R. Rowley, Bart., by the name and description of "Sir Joshua Rowley, Bart., Stoke, Suffolk," threatening to burn and destroy the houses, &c., the property of the said Sir J. R. Rowley, Bart., a subject of our Lady the Queen, then and there being, which said letter is as follows, that is to say:—"Sir,—This is to inform you that unless your tenant, Mr. Brown, of Polstead, pay his men an advance of wages, the present being 8*s.* per week for 12 hours' labour, he will be visited with a blaze; but your timely interference may prevent the intended calamity.—A POLSTEAD LABOURER. P.S. Mr. Brown's 8*s.* per week and 20*s.* per week for a policeman will not do; not but what an 8*s.* labourer wants looking after, for it is impossible for that man to live honestly without getting into debt. He is the only one in the parish at 8*s.*"—The second count charged that the prisoner knowingly did send to one William Brown the same letter with a certain fictitious signature, to wit, the signature, "A Polstead Labourer," subscribed thereto, directed to Sir Joshua Rowley, Bart., Stoke, Suffolk, threatening to burn and destroy the house, &c., the property of the said William Brown, a subject, &c. The third count charged that the prisoner knowingly, &c., did send to Sir J. R. Rowley, Bart., the same letter, threatening to burn and destroy the house, &c., the property of one William Brown, a subject, &c. At the trial it was proved that the letter was left by the prisoner at a gate in the public road near Sir J. Rowley's house, directed as described in the indictment, and sealed. Having been found there by one of the witnesses, it was forwarded by him to Sir J. Rowley's house, and there deposited in the steward's room. There it was opened by Mr. Hardy, the steward, who was authorised by Sir J. Rowley to open and read such letters. Mr. Hardy having opened and read it, did not deliver it to Sir J. Rowley, but handed it over to Stephen English, a constable. Stephen English afterwards, on the 9th of April following, showed the letter both to Mr. Brown and to Sir J. Rowley. Mr. Brown occupied a house and premises belonging to Sir J. Rowley, under an agreement, two years of which remained unexpired. He held no property under any other landlord, and was possessed of no house or premises of his own. As to the first count, charging the prisoner with sending a letter to Sir J. Rowley, threatening to burn Sir J. Rowley's property, I directed the jury that, as the house, &c., though in the occupation of Mr. Brown, belonged in reversion to Sir J. Rowley, the prisoner might be convicted on that count. As to the second count, I directed the jury to consider whether the prisoner, in leaving the letter as before described, intended that it should not only reach Sir J. Rowley, to whom it was directed, but that it should also reach Mr. Brown, and then, if they thought so, and were of opinion that it would be a sending to Mr. Brown, according to the suggestion of the judges in Paddle's case, that then the prisoner might be found guilty upon the second count, which so charged the offence. As to the third count, which was invalid in law, an acquittal was taken. The prisoner was found guilty on the first and second counts, and ordered to be transported for 10 years. I reserved the case for the opinion of the judges on both counts.—E. H. ALDERSON.—Mr. Gurdon now, on behalf of the prisoner, submitted that he ought to have been acquitted on both counts, and he apprehended that he could satisfy the Court that the prisoner was entitled to an acquittal on either of the counts, according to the decision in a recent case not yet reported. ("The Queen *v.* O'Connell.")—Mr. Baron Alderson: It cannot be raised by writ of error, because both counts are good. You think it comes within the equity of that decision.—Mr. Gurdon had understood his Lordship that he was to be at liberty to raise the question precisely the same as if he had been arguing a new trial. He submitted there were two offences charged, as much as in O'Connell's case there were three offences. The prisoner was receiving judgment for both, when he was only liable for one. On the first count he should submit that Sir J. Rowley had only a reversionary interest, and that the particular estate was in Brown, under the agreement which was unexpired. The premises must be taken to be the premises of the person in possession, and that was Brown. By the statute of the 4th George IV. cap. 54, sec. 3, it was enacted.—"That if any person should knowingly and wilfully send or deliver any letter threatening to kill a subject, or burn or destroy his or her house," &c. He submitted these words must mean a house of which he himself had the possession at law.—Mr. Baron Alderson thought the true construction was, to burn premises belonging to any of Her Majesty's subjects.—Mr. Gurdon observed, then, that he believed it had been held that the party to whom the letter was sent must also be the party threatened.—Mr. Baron Alderson: Then, if a man sends a letter to me threatening to murder my infant babe, it is no offence in point of law. I think that is going the full length of absurdity.—Mr. Gurdon thought the inference clear, because the infant could not be frightened.—Mr. Baron Alderson: But I should.—Mr. Gurdon thought the statute did not contemplate that.—Mr. Baron Alderson: Why should we give a strained construction when the plain construction meets the whole case?—Mr. Gurdon conceived it was the fear operating upon the mind of the party threatened which was the object of the act of Parliament.—Mr. Baron Alderson: Don't you think it would alarm the Marquis of Westminster if you threatened him to burn down Grosvenor-square?—Mr. Gurdon said, it was found that this letter never found its way to Sir J. Rowley until after it had been opened and given to the constable: it was not delivered to Sir J. Rowley, but shown to him, and he (Mr. Gurdon) apprehended that would not do; it must be such a sending that the letter should come to the party unopened.—Mr. Baron Alderson: Was not the act complete by dropping it?—Mr. Gurdon said, certainly not. It was not the mere writing a letter.—Mr. Baron Alderson: It was dropped with a view of reaching him.—Mr. Gurdon considered if it never reached him there was no threat; it must come to the party in order to strike terror into him.—Mr. Justice Patteson: Wagstaff's case comes nearest to it, where the man's wife had read it to him. The man there had dropped the letter.—Mr. Baron Alderson: I left it to the jury whether they thought the prisoner had dropped it with the intention that it should be forwarded to Sir J. Rowley. The act was complete when he dropped the letter.—Mr. Gurdon was not aware of any case where the mere showing a party an open letter would do. Here English had shown the letter—he must therefore be either an innocent or guilty agent—if guilty, he would be the principal in the offence, and the party who wrote the letter would be an accessory only.—Mr. Baron Alderson: You don't mean to say that English had anything to do with the guilt of the matter?—Mr. Gurdon said English must either be a guilty or innocent principal. If he (Mr. Gurdon) wrote a letter, and the fact of the handwriting was well known, it was the same as putting his name to it, it would be no deception. The party delivering the letter knew its contents, and he might have known the writer.—Mr. Baron Alderson: I don't think it will be safe for you to send a threatening letter, signing your name to it. You will be transported if you do.—Mr. Justice Patteson: Suppose he desires a person to deliver a letter, and that person does deliver it, you would not indict the person who delivered it for sending it, but you might for delivering it.—Mr. Gurdon: The whole of the threat depended upon the signature being a fictitious one. There was a clergyman in that very parish writing to people, begging them to employ the poor, or their property would be destroyed,—could he be indicted?—Mr. Baron Alderson: It is very kind in you to give him the caution.—Mr. Gurdon said, that if he had signed his name it would have done away with the whole offence.—Lord Chief Justice Tindal: Why should one man write to another that he would burn his house?—Mr. Gurdon submitted that it might be done out of kindness. He did not mean to contend that the present was not a threatening letter. The mere dropping it was no offence. If a person gave him a forged note to get changed at the Bank of England, and he took it, but said, "I would advise you not to change it, for it is forged," he apprehended that would not be an offence. Supposing a man placed a fire-ball in another's house, and the owner discovered it, and found out who put it there, and said, "I will cause the ball to explode, and then indict him for burning my house," he apprehended that would not do.—The Lord Chief Baron: With regard to taking the forged note, that would be an uttering with intent; but in this case there is no intent. The nature of the offence is described distinctly in the act of Parliament, sending a letter of a certain kind; there is no intent mentioned. Sending a threatening letter is a substantive offence, but uttering a note, unless with an intent, is no offence.—Mr. Baron Alderson: The whole act of the prisoner ceased when he dropped the letter. If he dropped the letter with an intention it should be forwarded, he completed the offence of sending; he dropped it in order that some one might pick it up and deliver it.—Mr. Gurdon said that here the party who had shown the letter was cognisant of its contents.—Mr. O'Malley appeared in support of the conviction, but was stopped by the Court.—Lord Denman said the meaning of the word "send" was to give something to another to carry or deliver. Whether the party was cognisant of the contents of the letter or not made no difference in the offence of the party sending. The Court thought the case had been properly left to the jury, to consider whether the act done in depositing the letter and the communication afterwards to Brown made out a sending to Brown. The jury found in the affirmative, and the Court thought they had done right. The Court proceeded only upon the second count.

ROLLS' COURT.—*Crosskill* v. *Grounsell.*—Mr. Kindersley, for the plantiff, renewed his motion made in July last, for an injunction to restrain defendant, his servants, &c., from making, manufacturing, or selling the machine mentioned in plantiff's bill for rolling and crushing clods of earth for agricultural purposes, or any imitation of the machine. An action was directed by the Court to be tried at Liverpool. The parties had gone to trial, the defendant having pleaded "Not Guilty;" that plaintiff was not the inventor, that it was not a new invention, that the invention was not properly described, that the teeth in the cog were not a new invention, and were not an improvement. These pleas raised the questions of validity and infringement of the patent. Upon every issue there was a verdict for the plaintiff, and upon defendant's application a new trial was refused. Injunction granted.

COURT OF EXCHEQUER. (Sittings in Banco.)—*Buron* v. *Denman.*—This was an action brought by a Spanish merchant against the Hon. Capt. Denman, who, when in command of the Warrior on the coast of Africa, destroyed a warehouse and emancipated a number of slaves, the property of the plaintiff. The defendant justified under the treaties between this country and the Spanish Government, for the suppression of the slave trade. The question came before this Court during last term on demurrer, and was argued at great length by Mr. Kelly, on behalf of the plaintiff. The case then stood over, upon the suggestion from the Court, as to the amendment of the pleadings, with a view to raising the question which it was really meant the Court should decide. Sir T. Wylde was now heard on behalf of the defendant. He observed, that the pleadings admitted that the slave trade was an infraction of the law of Spain; he contended it was also an infraction of the law of nations. Yet the plaintiffs applied to a Court of Law for compensation for an injury done in preventing him from committing an infringment of the law of nations. The Hon. Captain Denman was sent out in the Warrior to suppress the slave trade, and it was impossible for their Lordships, sitting in a Court of Law, to know the urgency of such service, or what an officer intrusted with such duty was required to do. If he outstepped his duty, he was amenable to a court-martial, but not to a civil action. At all events, he acted in a public capacity, and a Court of Law was not capable of judging if he acted within the terms of his duty as an officer or not. How inconvenient it would have been for a Court of Law to be called upon to determine the legality of the transaction connected with the bombardment of Copenhagen, or the destruction of the Danish fleet. When an officer acted in a public capacity, rightly or otherwise, surely the subjects of another country must have some other means of obtaining redress besides resorting to a Court of Law.—Baron Alderson wished to know if it was contended that the Ameers of Scinde might bring an action against Lord Ellenborough for false imprisonment?—Mr. Kelly saw no reason why they should not.—Baron Alderson: Perhaps Sir C. Napier and Lord Ellenborough might be jointly sued.—Sir T. Wilde continued: He did not contend that a person injured by any public misconduct of a British officer had not redress. All he contended was, that to entitle a party to redress in a Court of Law, the injury must be inflicted by the officer in his private capacity, and not in his public character. If Captain Denman, by his public conduct, had injured the property of a Spanish subject, the Spanish Government had a right to call upon the British Government for redress, and the Court would not presume that, if a proper case was made out, the British Government would be unwilling to afford redress. Here all that had been done was done by the defendant in his public capacity, under his instructions, which he was not to be called upon to disclose. If he destroyed a depôt for carrying on an illegal traffic, it was impossible for the Court to say he acted beyond the letter of his instructions. If he had done so he was responsible to the Queen's Government, from whom he obtained his instructions; but, upon every principle of law and public policy, he could not be held liable in a Court of Law in a civil action.—The Court having declared its intention of taking time to consider its judgment—Mr. Kelly applied to be allowed to amend the pleadings, so as to traverse the allegation that the defendant acted within the meaning of instructions from Government, if the Court thought such an allegation appeared on the defendant's plea.—The Court said the proper time to amend would be when the Court pronounced its opinion on the pleadings as they now stood.

BIRTHS.—On the 11th inst., at the Rectory, Sherborne St. John, Hants, the lady of the Rev. J. LAWSON, of a daughter—11th inst., at St. John's, Southwark, the lady of the Rev. O. F. OWEN, M.A., incumbent of Stratton Audley, Oxfordshire, of a son—15th inst., at Milton-street, Dorset-square, the lady of D. DAMPIER, Esq., of a daughter—15th inst., in Notting-hill-sq., Kensington, the lady of H. ADAMS, Esq., of a daughter—15th inst., at Addiscombe, near Croydon, the lady of P. HARDY, Esq., of a son—16th inst., at Upper Clapton, Mrs. C. BARROW, of a daughter.

MARRIAGES.—At Portsea, E. GIFFORD, eldest surviving son of the late Sir Hardinge Gifford, to ROSAMOND PENNELL, eldest daughter of W. Pennell Esq.—11th inst., at Antwerp, J. C. BOWRING, Esq., of Guadalupe-y-Calvo, in Mexico, to JEANNA HAY, eldest daughter of A. Hay, Esq., of Antwerp—11th inst., at St. Saviour's Church, Chelsea, C. HERRY, Esq., to MARY A. BAWTREE, eldest daughter of the late S. BAWTREE, Esq., of Whitehall, Colchester—16th inst., at St. George's, Bloomsbury-square, O. COPLAND, sixth son of J. Copland, Esq., of Chelmsford, Essex, to FRANCES ALLISTON, third daughter of J. Alliston, Esq.

DEATHS.—On Monday last, at his seat, Hall Barn Park, Sir GORE OUSELEY, Bart., aged 75—5th inst., at her house, 18, Melville street, Edinburgh, Mrs. E. H. GREIG, relict of David Greig, Esq., aged 88—12th inst., at Shirley, near Southampton, Lieutenant J. F. BROWNE, R.N., aged 47—13th inst., at Radnor-terrace, Folkstone, and late of Guernsey, deeply regretted, MARY ANNE SAYER, daughter of the late T. Sayer, Esq., of Sandwich, Kent, aged 49—**15th inst., suddenly, at 60, Portland-place, after a long illness, ISABELLA ROSS, widow of the late General Ross, aged 79—18th inst., at his residence, Lechlade, Gloucestershire, after a few days' illness, R. HEBERT, Esq., aged 74—20th inst., at the house of W. Walsh, Esq., Half-moon-street, Piccadilly, R. LAMBERT, Esq., second son of W. Lambert, Esq., of Sowerby, near Thirsk, aged 22.**

WANTED, a Man and his Wife, without incumbrance, to live at a small Lodge, and look after the Kitchen and Flower Gardens, Phaeton, &c., with occasionally the care and driving of one or two horses. He must be early and industrious in his habits, and a good groom and plain gardener, and be willing to render himself generally useful; he will have any requisite assistance, and a comfortable place. His wife, if disposed, may find employment about the house, farm, &c. None need apply whose characters will not bear the strictest investigation.—Direct to C. R., the Quarry, near Hagley, Worcestershire.

WANTED, a SHOPMAN in the SEED TRADE. None need apply whose character will not bear the strictest investigation.—Address, with references, salary, &c., W. F. G., *Gardeners' Chronicle* Office.

WANTED, a PARTNER.—A respectable person, of good business habits, having a knowledge of the Seed trade, and can advance about 500*l.* Any person of the above description, wishing to go into business, will find this a good opening.—Apply by letter, addressed, "Seedsman, *Gardeners' Chronicle* Office, London."

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, or GARDENER & FORESTER.—A married Man, 35 years of age, who is conversant with Gardening in all its branches; has particularly excelled in Pine and Grape growing, and is thoroughly acquainted with the late improvements in the culture of the Pine, Grape, Melon, Cucumbers, &c., which may all be grown in one house, at a comparatively trifling expense. Can be highly recommended for sobriety, industry, and integrity, by his late employer, with whom he lived six years as Gardener and Forester.—Direct to J. HAMILTON, Gardener to F. A. Phillips, Esq., Thornfield, near Stockport.

AS GARDENER.—A Nobleman's Gardener is desirous to recommend his Foreman to any one in want of a thorough practical Gardener. He has served him upwards of two years, and he can with confidence recommend him. Nine years' previous character can be had, if required.—Direct to M. D., Office of this Paper.

AS GARDENER.—JOHN MORRISON, who has been 11 years Foreman of the Royal Forcing Gardens at Kensington, is in want of a Situation, in consequence of the Royal Gardens being required for Government improvements. He can have an unexceptionable character.—Direct to J. MORRISON, Forcing Garden, Kensington.

AS GARDENER.—A Married Man, aged 40, without incumbrance; has a thorough knowledge of Pines, Grapes, and Gardening in all its branches, and can take the management of Land and Cattle, if required. Can have an unexceptionable character from the place he has just left.—Direct to A. B., at Mr. Henderson's, Nursery, Pine-apple Place, Edgeware Road.

AS GARDENER.—A steady young Man, who has a practical knowledge of the Fruit, Flower, and Kitchen Garden. Can have a five years' good character from the gentleman he is about to leave, who is leaving the neighbourhood, and has no further use for him. No objection to a single-handed place.—Direct to A. B., Mr. Mitchell's Nursery, Hornsey.

AS GARDENER.—W. SHERWOOD, Gardener to J. R. Mills, Esq., is desirous of procuring for a Young Man, whose experience in Horticulture is considerable, a situation either as Under Gardener where extensive Forcing is carried on, or as Gardener to a Gentleman or Lady requiring an industrious person capable of managing and improving a moderate-sized place.—Direct to W. SHERWOOD, 2, Grove-lane Stamford-hill, Middlesex.

TO SEEDSMEN AND OTHERS.

AS CLERK and ASSISTANT in a Seed Warehouse.—A respectable Young Man, who writes an excellent hand, and has a good knowledge of the Seed and Plant Trade. An unexceptionable character will be given by a respectable firm whom the advertiser has recently left.—Direct to Y. Z., Messrs. Flanagan and Co., Seedsmen, opposite the Mansion-house, London.

AS BAILIFF.—A middle-aged married Man, who understands Cattle, Horses, Woodlands, is a good Seedsman, has been used to buy and sell corn and cattle on a farm of 22 acres, which he has superintended for nine years, and can be well recommended by his present employer.—Direct to A. O. Post Office, Conden, near Tunbridge Wells, Kent.

FIVE POUNDS will be given by the Advertiser, a single Man, to any Nobleman or Gentleman's gardener who will obtain for him a Situation as GENERAL FOREMAN where every department of the business is carried on and conducted on the most improved principles. He has had years' practical knowledge of his profession, having lived several first-rate establishments both in England and Scotland.—Direct "D. V.," stating terms, to the Office of this Paper.

ROSES.

MESSRS. LANE AND SON, Great Berkhampstead, Herts, have an extensive and well-grown Stock of Standard and Dwarf Roses, which they are enabled to offer at the following prices, the selection being left entirely to themselves, viz.:—

DWARFS, good old sorts without names, on own roots . . . . . 30*s*. per 100
Ditto ditto with names, in pairs, on own roots 50*s*. per 100
Ditto superior ditto . . . . 12*s*. to 30*s*. per doz.
STANDARDS, first rate . . . . . 10*l*. per 100
Ditto ditto . . . . . 24*s*. to 30*s*. per doz.

They have also an immense Stock of Roses in pots for greenhouse culture, at from 18*s*. to 30*s*. per doz. Likewise numerous others at a much lower rate, but which they could not confidently recommend.

Rose Catalogues for 1844-5 may be had on application to the Nurseries, inclosing a 2*d*. postage stamp.

Great Berkhampstead, Nov. 30, 1844.

ENGLISH OAKS FOR TIMBER.—THE TRUE QUERCUS SESSILIFLORA AND Q. PEDUNCULATA.

W. JACKSON & Co. beg most respectfully to call the attention of the Nobility, Gentry, and Planters in general to the above valuable Trees, of which they possess a fine healthy stock, grown from Seeds carefully collected from their own timber-trees. Two years' Seedlings, 6*s*. 6*d*. per 1000. Transplanted, 1 to 1½ ft., 1½ to 2 ft., 2 to 3 ft., and 3 to 4 to 6 ft.; Prices with every other particular will be given on application. Carriage paid to Newcastle, York, and London, when ordered in large quantities.

Cross Lanes Nursery Office, Bedale, Yorkshire, Nov. 30.

GERANIUMS AT VERY LOW PRICES.

WM. E. RENDLE, having a large stock of the following sorts of GERANIUMS, is enabled to offer them at very low rates.

*** A dozen will be forwarded on receipt of a Post-office order, including hamper, package, and carriage free to the Exeter terminus of the Great Western Railway.

Class 1.—30*s*. per dozen, including package, carriage, &c.—Lady Villiers, Fascination, Thunderer, Oberon, Favourite, Prince of Waterloo, Jessie, Count D'Orsay, Lord Ebrington, Constellation, Lavinia, Cornish Gem, Attila, Duke of Cornwall, Sunrise, and Modesty.

Class 2.—20*s*. per dozen, including package, carriage, &c.—Evelina, Gipsey, Witch, Hamlet, Cynthia, Aurora, Creole, Lady Cotton Sheppard, Countess of Mount Edgcumbe, Fair Maid of Devon, Wonder of the West, Portia, Jupiter, Life-guardsman, King John, Sultan, and Princess Royal (Lyne).

Class 3.—15*s*. per dozen, including package, carriage, &c.—Camilla, Consort, Van Amburgh, Enchantress, Glory of the West, Ivanhoe, Flash, Queen of the Fairies, Grand Monarch, Amethyst, Wildfire, Mabel, Prince Albert, Nymph, Bridegroom, and Sybil.

All the plants are strong, healthy, and well established, and will be forwarded immediately on receipt of order.

Union Road Nursery, Plymouth, Nov. 30, 1844.

BAGSHOT NURSERY, SURREY.

JOHN WATERER begs to call the attention of the Nobility, Gentry, and Public, to his unlimited collection of AMERICAN PLANTS, which are this season unusually well set with bloom buds, particularly those for forcing, comprising,—Rhododendrons, Kalmias, Azaleas, Andromedas, Ledums, Daphne cneorum, &c. Also those of larger sizes, among which may be had Rhododendron Catawbiense, and many other fine varieties; Kalmia latifolia, Magnolias, of sorts; Azalea coccinea major, and aurantia, &c. &c., from 3 to 6 feet, which are fine objects for single specimens or borders, being bushy to the ground. J. W. begs to recommend his unrivalled Stock of Cedars of Lebanon, 18 inches to 4 feet; also about 200, 4 to 9 feet, bushy to the ground, very handsome for Lawns; the whole of them warranted to move safely. Also about 6000 Spanish Chestnuts, 4 to 6 feet; 50,000 Larch Firs, 2 to 4 feet; 50,000 Birch, 3 to 4 feet; the whole of which may be had at moderate prices. N.B.—Planting done by contract.

Nursery, Bagshot, Surrey, 3½ miles from Farnborough Station, South Western Railway.

THE TRUE FASTOLFF RASPBERRY.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, HIS GRACE THE DUKE OF MARLBOROUGH, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL AND CO. beg to announce they are again able to supply fine canes of the above truly excellent variety, unequalled for the size of its Fruit and richness of flavour; prices as follow:—

Packages containing	100	Canes	. £2	0 0
Ditto	,,	50	,, .	1 1 0
Ditto	,,	25	,, .	0 12 0

YOUELL AND CO. take the present opportunity to state that the above unequalled RASPBERRY is to be obtained only at their Nursery or of their Agents, a list of whom appeared on the Advertising Sheet of last week's *Gardeners' Chronicle*; and they recommend their friends to be cautious of whom they purchase, as another Raspberry, under the above title, has been substituted by certain parties as the "true variety."

Great Yarmouth Nursery, Nov. 30, 1844.

TO MELON GROWERS.

FISH'S EARLY CANTALOUPE and HARDY GREEN-FLESH MELONS. The above are recommended to all Melon-growers, as, independent of the good quality of the Fruit, they are so hardy as to require comparatively little attention; a fact of considerable importance where fuel is expensive, and fermenting material a scarce commodity. Both sorts were awarded Certificates of Merit at Regent-street, London; the Cantaloupe on the 7th of May, described as "good early fruit;" and the Green-fleshed on the 4th of June, described as "capital green Melon, highly fragrant, and weighing nearly 5 lbs." The Cantaloupe grows from 4 to 6 lbs. in weight. Fruit was exhibited in July at Chiswick, weighing 4 lbs. 14 oz., and the fifth crop is maturing in November, from the same plants cut from in May. Specimens of the Green-fleshed, from the same plants cut from in June, were exhibited at Regent-street, on the 1st Oct., weighing 3 lbs. each. These have been grown on dung beds, as described in the *Chronicle* of the 7th May and 1st October.

Youell and Co. having purchased of Mr. Fish the entire stock of Seed of the above most desirable Melons, for the first time offer it to growers, being fully confident of its realising all the merits ascribed to it. Sealed packets, containing three seeds of each, 6*s*., sent per post, free.

Great Yarmouth Nursery, Nov. 30, 1844.

THE FILBY, or FASTOLFF RASPBERRY.—At the request of some gentlemen living in the neighbourhood of Yarmouth, T. RIVERS begs to submit the history of this really excellent Raspberry to the public. In the year 1814 Colonel Lucas, of Filby, a place lying between Norwich and Yarmouth, discovered a Raspberry plant growing under an old Laurel hedge in his garden. His attention was drawn to it, and he soon found it to be a superior and delicious variety, so that in a short time every other sort was ejected from his garden, and this alone cultivated. It was not, however, till 1824 that he allowed his gardener to part with it, who then gave canes to his neighbours, and by this means it got to be cultivated in Caistor, Ormsby, and, in fact, in all the neighbourhood, under the name of the Filby Raspberry, to the exclusion of all other sorts. It has latterly often been called the Caistor Raspberry, from the Market Gardeners growing it in that parish. In Caistor is an old castle in ruins, that formerly belonged to the Fastolff family: the latter name was given to the variety by Youell and Co., when they first began to sell the canes. The fruit upon which Dr. Lindley pronounced his opinion was gathered in the Filby garden, now the property of the Rev. G. Lucas, who authorises and permits the publication of the above facts; and has also permitted his Gardener to supply the Canes after this date to T. RIVERS only.

Canes are sold at 30*s*. per 100, or 6*s*. per score, carriage paid to London. Charge for package, for small parcels, 6*d*., for large do., 1*s*. to 1*s*. 6*d*. Orders to any amount can be executed. The Trade price will be given on application.

Sawbridgeworth, Herts, Nov. 30, 1844.

JOHN BELL begs to inform the Public he has a Large Stock of Strong VINES in pots, 2 and 3 years old, from Eyes, at the following prices:—

Strong 2 year old Plants in Pots	.	.	5*s*. 0*d*.
,, 3 ,, ,, ,,	.	.	. 7 6
Very Strong Fruiting ,,	.	.	. 10 6

FASTOLFF RASPBERRY.

J. Bell begs to correct the statement in the *Gardeners' Chronicle* two weeks since, respecting the above Raspberry having been originated in W. Jary, Esq.'s garden, at Burlingham. It was first discovered in Col. Lucas's garden at Filby, as stated by Mr. Rivers, and the first canes of it given to Mr. Perfect, gardener to W. Jary, Esq., by W. Reynolds, the then gardener at Filby.

J. B. begs to assure his numerous friends, whom he has supplied with Canes of the above Raspberry, that they may rely on their being the True Fastolff, and that no spurious sort is known about this part of the country, as stated in the Messrs. Youell's Advertisement last week.

Horticultural Establishment, Bracondale Seed Warehouse, 3, Exchange-street, Norwich.

IMPORTANT TO PLANTERS.
ILEX OR EVERGREEN OAK.

W. E. RENDLE has a large Stock of this most valuable hardy tree, and can supply fine two-year old Seedlings, from seed-pans, at 20*s*. per 1000, package and carriage free to the Exeter terminus of the Great Western Railway.

Union Road Nurseries, Plymouth, Nov. 30, 1844.

SUCCULENTS FOR SALE.

WILLIAM MASTERS, of the Exotic Nursery, Canterbury, is instructed to sell, in one lot, by private contract, a very Excellent Collection of SUCCULENTS, the property of a gentleman who is about to discontinue their culture. To a person wishing to possess a collection of these interesting productions, this collection offers many points of attraction. The plants are healthy; the number of species considerable, and the price moderate.

For particulars inquire of Mr. Masters, Exotic Nursery, Canterbury.

LYNE'S GERANIUMS.—See the FLORISTS' JOURNAL FOR NOVEMBER 1844.

Coloured Engravings of Princess Alice and White Perfection, which, with Confidence and Redworth, are now sending out at 21*s*. each.

Wm. E. Rendle, Union-road Nursery, Plymouth, Nov. 30.

PLANTING SEASON.

W. ROGERS AND SON, Nurserymen, Contract Planters, & Landscape Gardeners, Southampton, beg respectfully to notify that their Nursery Stock is this season unusually fine, and from the extent of their grounds they are enabled to execute orders to any amount, and at the lowest price; delivered free of carriage (if ordered in quantity) per railway to London, or by steam-vessels coastwise.

SEEDLING.

Ash, 1 yr., 1*s*. 6*d*. ,, 2 yrs., 2*s*. 6*d*. Beech, 1 yr., 2*s*. Birch, 1 yr., 2*s*. } per 1000.
Spanish Chesnut, 1 yr., 10*s*. Pinaster, 1 yr., 2*s*. 6*d*. 2 yrs., 3*s*. 6*d*. } per 1000.

Sea Pine (Pinus maritima), excellent for nurses or exposure to the sandy sea-shores of Scotland or Ireland, 1 yr., 5*s*., 2 yrs., 7*s*. 6*d*. per 1000.

Oak, the true "Durmast" of the New Forest (Quercus sessiliflora), producing timber of the largest dimensions, and decidedly the most valuable species of the English Oak, 1 yr., 7*s*. 6*d*., 2 yrs. 10*s*., 3 yrs. 15*s*. per 1000.

If 100,000 of any one sort is ordered, a deduction from these prices will be made.

TRANSPLANTED.

Prices and samples of the various sizes may be had on application.

Alder	.	.	.	1	2 ft.	Oak, "Durmast," English	.	.	.	1	2	3 ft.

Elder, common black, 8*s*. per 100. Excellent for sea embankments. Tamarisk, 8*s*. per 100.

MISCELLANEOUS.

A great Stock of Forest and Ornamental Trees of large growth, from 6 to 10 feet, adapted for immediate effect.
Single Camellias, from pots, well rooted, 50*s*. to 75*s*. per 100.
Rose stocks, 8*s*. per 100, from cuttings of the Bourbon De Lisle, on which all kinds take freely by buds and grafts, and may be grown in the smallest sized pots.
Double Furze, 25*s*. per 100. Forms a beautiful flowering hedge.
Double Red Thorn; Double White do.; Single new crimson, 50*s*. per 100. Sea Pine, from pots, 40*s*. per 100.
Ribes sanguineum, 12*s*. 6*d*. per 100. Kalmia latifolia, 40*s*. per 100.

Printed Catalogues and Prices of their general stock may be had. Gardeners of experience and ability recommended.

CHEAP AND GOOD PELARGONIUMS.

W. MILLER has several thousands of good Plants of the very best PELARGONIUMS, selected from those exhibited by the most successful raisers:—as, Foster, Garth, Beck, Lyne, Gaines, Wilson, Thurtell, Catleugh, and others; and can be well recommended as good additions to small or large collections, and will be sold, at low prices, by the dozen. A select List may be had on application,

W. M. has also a few more sets of those splendid new seedling Pelargoniums raised by G. M. Hoyle, Esq., Guernsey; also some packets of Mr. Hoyle's choice Seed—50, 7*s*.; 100, 12*s*.—Providence Nursery, Ramsgate.

NURSERY LARCH.

COWAN AND CO., Nurserymen, Glasgow, have on hand a large quantity of well grown transplanted LARCH, 2 and 3 feet high, which they will sell at a low price, as they must be removed this season. All sorts of Forest-trees, seedling and transplanted, grown extensively, and offered at very moderate prices.

NURSERY STOCK.

RICHARD MITTON, Nurseryman, Pontefract, being about to clear off five Acres of Nursery Stock, consisting of Forest and Fruit-trees, Evergreen and Flowering Shrubs, &c., begs to offer the same at unusually low prices. Particulars may be had on application.—Pontefract, Nov. 30.

J. B. SMITH, having purchased the rare and valuable STOCK-IN-TRADE of the executors of his late father, begs leave to inform the Nobility, Gentry, and Amateurs, that he intends carrying on the Business as hitherto, and shall be glad to be favoured by their kind commands, which shall ever meet his best attention. A choice collection of Rhododendrons, Azalea Indicas, Hardy Azaleas and Ghent Azaleas, Camellias, Roses, Pelargoniums, Liliums, &c., including the most novel and approved varieties; a priced list of which may be had on application. A liberal discount for cash. A remittance or reference from unknown correspondents is solicited.

Norbiton Nursery, Kingston, Surrey, Nov. 30.

PETER LAWSON AND SON,
Seedsmen and Nurserymen to the Highland and Agricultural Society of Scotland.
AGENTS.—Messrs. W. and J. NOBLE, Seedsmen, 152, Fleet-street, London.
Edinburgh, Nov., 1814.

TULIP SEED, &c.

H. GROOM, CLAPHAM RISE, near London (removed from Walworth), BY APPOINTMENT FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, having observed in the Leading Article of the *Gardeners' Chronicle* of Nov. 16, a notice of raising TULIPS from Seed, he begs to state that he has saved a large supply of Seed this season, which can be had in packets at 5*s*. each. He also begs to offer the following articles:—

	£.	s.	d.
100 TULIPS, in 50 fine sorts, with names	5	0	0
Superfine mixtures, 21*s*. per 100.			
100 RANUNCULUSES, in 100 superfine sorts, with names	2	10	0
Superfine mixtures, 10*s*. 6*d*. to 21*s*. per 100.			
100 ANEMONES, in 100 superfine sorts, with names	2	10	0
Superfine mixtures, 10*s*. 6*d*. per 100.			
25 AURICULAS, in 25 superfine sorts, with names	3	3	0
25 pair of CARNATIONS, in 25 do. do.	2	10	0
25 pair of PICOTEES in 25 do. do.	2	10	0

LILIUM LANCIFOLIUM ALBUM, good bulbs, 3*s*. 6*d*. each.
,, ,, PUNCTATUM ,, 7*s*. 6*d*. ,,
,, SPECIOSUM, true ,, 52*s*. 6*d*. ,,
Foreign orders executed

KNAP HILL AND BAGSHOT NURSERIES.

NOTICE.—The Business of these Nurseries, since the death of the late Michael Waterer, carried on in the name of H. and J. WATERER, is by mutual agreement divided. The KNAP HILL NURSERY will in future be carried on by HOSEA WATERER, and that at BAGSHOT by JOHN WATERER. It will, therefore, be of importance, to prevent confusion, that correspondents be particular in the address, and direct letters intended for the Knap Hill Nursery, to HOSEA WATERER, Knap Hill, near Bagshot; and those for the Bagshot Nursery, to JOHN WATERER, Nurseryman, Bagshot, Surrey.—November 30.

SHILLING'S EARLY GROTTO PEA.

THE above PEA possesses advantages over every other for autumn sowing, being quite hardy, very prolific, and much larger than any other early Pea. See *Gardeners' Chronicle*, 25th of last May. "Mr. Shilling has sent us specimens of his New Early Grotto Pea, which were gathered on the 20th inst. He states that these were produced from seed sown in the open ground on the 25th of last November. Judging from the specimens sent, this is a fine, large, good-looking Pea, and will, no doubt, be found to be a very useful early variety."

To the Market Gardener they will be found invaluable. Price 1*s*. 6*d*. per quart, 10*s*. per peck.

SHILLING'S QUEEN CABBAGE, which gave such general satisfaction last year, as the best early variety grown. Having saved a considerable quantity of seed this summer, it is offered on the following advantageous terms:—1*s*. 6*d*. per oz., 16*s*. p. lb.

Agents—Messrs. Field and Child, 119, Lower Thames-street; Messrs. J. and W. Noble, 152, Fleet street; Mr. J. Kernan, 4, Great Russell-street, Covent Garden; Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.

Northwarnborough Nursery, Odiham, Hants.

ADDRESS TO THE PLANTERS OF ENGLAND.

TRUE HIGHLAND PINE-TREE.—MY LORDS, LADIES, AND GENTLEMEN,—The time has come when all those who have waste lands at their disposal should plant them. Of this I am fully persuaded, and I beg you will allow me to explain on what grounds this opinion is founded. England, generally, is a thickly-wooded country, yet, strange though it may appear, it has not been planted with any view to meet its most urgent wants. If the poor farmer require an outhouse built for his cattle, he cannot have it because there is no deal-wood in the neighbourhood: he builds it therefore of whins, or of any other rubbish he can lay hold of. Instead of having plenty of fir-wood on at hands to form young hedges, planted like other things on the common surface of the ground, military-like fortifications have been raised to divide fields, occupying as much good land as is contained in three of the largest counties of Britain: it is on those banks ineffectual attempts have been made to grow hedges. After the 1st of March, when the Royal Agricultural Society's prize on fences shall have been awarded, a great proportion of the hedges throughout England will be reconstructed by planting them on the plain surface; and the question will then arise, "Where is the wood to protect them in their young state to come from?" Turning to the railways which are now being formed in every county in England, another and greater question arises as to the supply of wood which will be required in *their* construction. Go up, I am told, to the Lebanons of our island – those immense forests in the north of Scotland - and there hew down as many trees as will be required. From those, however, I find we must expect but a limited supply. Like the famous Mount of old, they are already overrun with the axe, and a continuance of the present rate of demand for a few years more will reduce the trees upon them to a mere remnant. It is not the original numbers required for sleepers which will effect this change, but it is the incessant demand, *ad infinitum*, for timber to replace that which is already laid down, or may be for the future laid down in additional lines. Look at it how we may, the state of our country at the present crisis proves that our immense and almost measureless tracts of what is generally called waste land were not created to be a scene merely of unproductive solitude. The rains with which they are refreshed, and the fostering sunshine that rests upon them, might have taught us that Providence had designed them to contribute in some way or other to the wants of man; and though Nature has been unable to lead us to comprehend her lesson, so simply brought before us, necessity has at length compelled us to look to these districts where only a sufficient quantity of timber can be raised to meet our increasing wants. Now, then, is the time to plant: wherever there is a waste piece of ground, moor, or mountain, let it be forthwith invested with trees, for every year, for many years to come, will unquestionably bring with it an additional demand for timber. Thus far on the necessity of planting. Allow me next to bring under notice the sort of tree I would recommend to be planted, which is the chief aim of this Address. That tree is the TRUE HIGHLAND PINE, for introducing which, I had the honour, along with my brother, of receiving the Highland Society's prize. It is admirably fitted, in every respect, to take possession of all the uplands throughout England. It will grow freely on all soils suitable for the common Pine; its wood is very durable; and for railway sleepers it is unrivalled. Brindley, the celebrated engineer, considered its durability equal to that of the Oak; and Dr Smith states, in the *Transactions of the Highland Society of Scotland*, that he has seen some of it taken down after it had been 300 years in the roof of an old castle, as fresh and full of resin, as newly imported timber from Memel, and that it was actually worked up into new furniture. "Such," says Loudon, "is the durability of this wood, that while the bog timber of the Birch is often found reduced to a pulp, and the Oak cracks into splinters as it dries, the heart of this Pine remains fresh, embalmed in its own turpentine."

MY LORDS, LADIES, AND GENTLEMEN,—Allow me to add a word or two on the merits of this tree as a landscape ornament. In this respect it rivals, if not excels, the Cedar of Lebanon. It has, at any rate, a much better ramification than the Cedar; for, as Sir Walter Scott observes, it assumes in a great measure the bold and contorted figure of the Oak. In illustrating the Seats of Norfolk (and the remark is applicable to all England), it frequently occurred to me that advantage had not been taken of prominent situations by investing them with grand evergreen trees; for so soon as November comes, our parks lose almost all that weight of grandeur for which they are so celebrated in summer-time. Their solemnity ceases with the fall of the leaf; but were they ornamented with this Pine, its broad umbrageous canopy remaining green during winter, the change consequent upon the approach of winter would be much less observed, and our country residences would at all times be surrounded with the dignified accompaniments so consistent with their character.

The importance of this subject will, I doubt not, be accepted as an apology for my thus venturing to express my opinions so plainly on matters of English practice. My suggestion as to the improvement of park and pleasure-ground scenery by introducing the Pine in question is offered with the greatest deference, being fully persuaded that in matters of this description England has been always distinguished for its refined taste. I am ready to dispose of the Highland Pines at the following prices:—

Single Plants, strong and well rooted	6*d*. each.
Strong Plants, 18 to 20 inches high	5*s*. per 100.
Strong Plants, 15 to 18 inches	30*s*. p. 1000.
Smaller-sized Plants for exposed situations	10*s*. to 20*s*. p. 1000.

I have the honour to be, My Lords, Ladies, and Gentlemen,
Your most humble Servant.
JAMES GRIGOR, NURSERYMAN, Norwich.

TO THE CULTIVATORS OF ROSES.

R. B. BIRCHAM, Hedenham Rosery, Bungay, Suffolk, begs to offer the following choice PERPETUAL ROSES. Good dwarf plants, own roots, suitable for pot culture or transplanting into the open borders.

LANDSCAPE GARDENING AND GARDEN ARCHITECTURE.

MR. GLENDINNING, since his residence near the Metropolis, has had the honour to be consulted by a number of Noblemen and Gentlemen in the improvement of their Parks and Gardens, and in the construction and heating of Horticultural Buildings in the most ECONOMICAL as well as effectual manner. He has now made such arrangements as will enable him to devote his particular attention to these important subjects; and Noblemen and Gentlemen desirous of consulting him, are respectfully requested to address him at Chiswick Nursery, near London.

WANTED, 500 YEWS, 6 inches high; 250 BUCK-THORNS, 1 foot high; 50 Small DECIDUOUS CYPRESS. Prices to be sent to Mr. MATTHEWS, 5, Upper Wellington-street, Covent Garden, London.

The Gardeners' Chronicle.

WEDNESDAY	Dec. 11	Microscopical	8 P.M.
SATURDAY,	Dec. 14	Royal Botanic	4 P.M.

WE proceed to redeem our promise of offering remarks upon the EXPERIMENTS made by our correspondents with POTATOES during the past season; and we commence with one of singular interest and importance by Mr. GREY, of Dilston, the full particulars of which will be found in another column.

It is well known that whatever care may be bestowed in taking up a Potato crop in the autumn, some tubers will remain in the ground; and it has been observed that the plants from such tubers are extremely vigorous when they make their appearance in the succeeding spring. Potato-growers are also aware of the existence of a prolific variety called the Onion Potato, which is always allowed to remain in the ground during winter. These, or some such facts, have led to the suspicion that it would be better to set Potatoes in the autumn than in the spring, and that this sort of plant is hardier than is generally supposed.

Mr. Grey, of Dilston, in the experiment now published, has put this question to the test; and, considering the care and skill with which the trial was made, we must regard it as conclusive under exactly the same circumstances. It will be seen that autumn-planted crops gave a return of 111 loads per acre, while the spring-planted produced but 86 loads, although, with the exception of the season of planting, all other circumstances were equal.

The circumstances under which so enormous a difference was obtained, without the expenditure of one shilling more in the cost, are deserving most careful investigation. It appears that the main features in Mr. Grey's operation were—1. That the Potatoes were replanted as soon as they were taken up; 2. That a moderate quantity of but slightly-fermented dung was employed; and, 3. That the sets were well covered in by deep ploughing. Of these the two last are, we imagine, the most important; and they are probably indispensable to success.

Whether or not the Potato is reset as soon as taken up, or at a later period in the autumn, is perhaps unimportant; and therefore we should be inclined to attach little weight to the supposed difficulty of getting land ready so early as to take an autumn crop of Potatoes directly after harvest. If they cannot be planted, like Mr. Grey's, by the 20th October, they might, we conceive, be in the ground without risk a month or five weeks later, in well-drained land, without any difference in the result. Our reason for entertaining this opinion is, that the Potato undergoes no change during the autumn or winter—it is only when the spring returns that mischief is done to the Potato seed by sprouting and heating; and it can hardly make a difference in the result whether the Potatoes to be planted are buried in drills in the soil of a field, or in heaps of earth in any other place. We would, therefore, advise the experiment to be tried even now, if the weather remains mild enough, by those who have land in proper order, provided it is light and thoroughly drained. It would, however, be better now to plant whole Potatoes rather than sets.

The two last precautions adopted by Mr. Grey may be considered together. Potatoes cannot bear frost: the objection to autumn planting is the supposed difficulty of preserving them from it with certainty. By a slight addition of loose dung, and burying them to a sufficient depth, Mr. Grey was able to keep off the frost of 1843-4; and therefore he succeeded. But it remains to be determined whether the same precautions will be sufficient in another winter. We do not know what was the lowest degree of temperature near Newcastle last winter, but we find that near London the thermometer never sunk lower than 14°, and that frost did not penetrate the ground there deeper than 2 or 3 inches. From so slight an amount of cold the means employed by Mr. Grey would be amply sufficient to guard the Potatoes. But would they be equally effectual in harder winters?

The difficulty of answering this question with confidence arises out of the insufficiency of our information concerning the temperature of the soil. Observations on the temperature of the air are endless; on that of the earth very few. Indeed, we cannot lay our hands upon any in which confidence can be placed, except those of Mr. Ferguson, of Raith, and such as have been recorded in the Garden of the Horticultural Society. It appears from the former observations, that at one foot below the surface the thermometer stood as follows:—1816, Jan., 33°, Feb., 33°.7, Dec., 35°.7; 1817, Jan., 35°.6, Feb, 37°, Dec., 35°.9. (See "Theory of Horticulture," p. 95). It is therefore to be inferred that a covering of soil to the depth of a foot would have proved sufficient in all these months. Moreover, loose soil conducts heat worse than hard soil, and the loss of heat would be still further diminished by long litter used with it, so that Mr. Grey's method would probably afford ample protection in such seasons as that of 1816 and 1817. We should, indeed, be inclined to think that it would afford protection in any English winter; for at a foot below the surface, in solid ground, experience shows that the temperature in winter is about a degree or a degree and a half above the *mean* temperature of the atmosphere. It is true that, according to the testimony of various persons, a much greater degree of cold is experienced in the soil. It was, for instance, stated that during the hard frost of 1837-8, the ground was frozen to the depth of 28 inches at Claremont, and at Liverpool to the depth of 18 inches; but it is to be remarked that in the former of these places the thermometer in the air is said to have fallen to 14° *below* zero, while in the latter it was not less than 9° *above* zero. There is, however, great reason to suppose, either that there was some error in those observations, or that the state of the earth was modified by unexplained local causes. For in the very carefully conducted experiments in the Garden of the Horticultural Society, the solid ground at one foot below the surface was never actually frozen (although the thermometer fell to 4½° *below* zero), the lowest range of a thermometer buried one foot below the surface having been 33°; and it was found by digging, that the frost had only penetrated the loose soil of the Kitchen Garden 9 inches; a hard loam footpath 10 inches; the soil of a mossy lawn 5 inches.

What experience we have then, leads us inevitably to the conclusion that autumn planting, with the precautions taken by Mr. Grey, will not only succeed in mild winters, but probably also in our hardest. And this conjecture is rendered the more plausible by the well known fact, that plants, even when frozen, are but little injured if they thaw slowly, and in the dark, which is precisely what must happen to the buried Potato. We would, therefore, have Potato-growers bestir themselves and attend to this matter; for we presume they can have no objection to change their 15*s.* for a guinea, which was about what happened in Mr. Grey's very important experiment.

AMONG the smaller class of contrivances which the fondness for house-gardening has called into existence, nothing is better in its way than Mr. BECK'S SLATE POT, made by jointing together small slabs of slate into the capacity of a common garden-pot. To be sure, they are at first somewhat expensive, but, like many other expensive things, they are really much cheaper than what costs less money; for they cannot be worn out, and can scarcely be broken; besides which, they are much better suited for sitting-rooms than common garden-pots, whose porous material renders it difficult to keep them moist without being wet. Some of the finest Roses and Pelargoniums that appeared at the London Shows last year were grown in this kind of vessel, and every one who saw them must admit that they were unsurpassed. Slate pots possess, moreover, the convenience of being square, so that they can be easily packed into any given space, and of being heavy, which prevents their being easily upset.

In short, they are a prodigious improvement upon the garden-pot, both as regards appearance and utility, and we heartily recommend them to the favourable consideration of the public, who will not think the worse of them when they know that their fabrication gives winter employment to some very worthy and deserving workmen.

To this we would add a word of commendation in favour of MR. HUNT'S NEW HYACINTH POT, made in ornamented China, and in the form of the common Hyacinth-glass. It has a neat contrivance for fixing the wires required to steady the flowering spike and leaves of the Hyacinth, and presents the advantage of keeping the young roots of this bulb in the dark. To this we may add, that they are better-looking than the Hyacinth-glasses in common use.

ON PRUNING FOREST-TREES.

WITHOUT entering into the controversy between Dr. Thackeray and Mr. Billington, on their different systems of pruning forest-trees, I beg to give what, according to my limited experience, I conceive to be the best system of pruning trees which are designed for timber.

The object aimed at is to produce the greatest quantity of timber, of the best quality, in the shortest time. If the object were simply to produce the greatest quantity, without having regard to its quality, there is no doubt that this would be best accomplished by judicious thinning, and in other respects leaving the trees entirely to nature. For it is generally agreed that the office of the leaves of a tree is to elaborate the crude sap which rises from the root, and form it into *cambium*, or proper juices, which descend and form every year a layer of alburnum or soft wood between the bark and the wood of the previous year, down to the root, which alburnum hardens into timber; and the longer the tree stands the harder it becomes, from the pressure of the successive annual layers. This being the case, it is easy to understand that a tree loses an organ of nutrition in every leaf that it is deprived of. But it is required that the timber should be of good quality, as well as great in quantity; and this treatment would not answer for that purpose; because the best timber is produced in the bole, and by leaving a tree to Nature, the branches, where they had room to grow, would increase at the expense of the bole, which would then most probably become forked at a short distance from the ground. The object of pruning, therefore, is to obtain a tall, straight, and thick bole in as short a time as possible.

Now, if the growth of trees be carried on in accordance with the principles above alluded to, and the leaves perform the important functions attributed to them, I conceive that in order to obtain the desired end, two objects ought chiefly to be kept in view, viz., to increase, as much as a tree is capable, the amount of its foliage, and to decrease, as much as possible, the amount of wood in the side-branches. If both these objects could be accomplished at the same time, and in the same tree, the foliage having little or no wood in the side-branches to support, the timber in the bole would rapidly increase. But since this is impossible, as these two objects are incompatible with each other, and cannot be both fully attained, the best mode of pruning is that which can most nearly unite the accomplishment of both these objects, and make the one yield to the other in the proper proportion.

The following method is the best with which I am acquainted for effecting this; and, so far as I can judge from the little experience of it that I have had, I can confidently recommend it as likely to prove successful, if properly followed up.

Commence pruning when the trees are young; and, beginning at the top of a tree, cut off all the leaders but the strongest and best ones, at the second or third bud from their base; then cut off the first side-shoots below these, at the fourth or fifth bud from the main stem, the next at the sixth and seventh, and so on, downwards, in regular gradation to the bottom; so that the tree may assume a conical shape, each side-branch projecting a little further from the main stem than the one immediately above it. I do not mean that these directions should in every case be followed exactly; I merely give the principle, as nearly as I can. By this mode the lateral branches of the tree, instead of becoming large and projecting far from the stem, with perhaps only a few leaves at their extremities, will be kept of a moderate length; and small branches bearing leaves will be greatly multiplied, so that the tree will be well clothed with foliage nearly from the top to the ground, and a quick upright growth will be produced. This pruning should be repeated every year, or oftener, if required; and it may be done at any season of the year, as the branches to be cut off will always be small, and therefore small wounds will be made; and time would be lost by delay, although the best season is the early part of summer, soon after the trees have completed the growth of their spring-shoots.
